The New York public service commission is making active progress with its plans for much-needed additional subway construction in New York and it now seems entirely probable that construction may be started on at least one route during the present year. The plans for the Broadway-Lexington route in Manhattan and the Fourth avenue route in Brooklyn have been approved by the board of estimate and bids for the construction of the latter are now being solicited. In its present plans for increasing the city's transportation facilities the commission has made general departures from former practice which were dictated by the experience of the old rapid transit commission. It will be remembered that the latter, after having spent nearly four years in the preparation of plans for the Lexington avenue route, failed to secure a bid for its construction and operation, the Interborough-Metropolitan Company, the only logical bidder, declining because the term of lease for operation was restricted by the Elsberg law to 20 years. In the case of the new subways bids will be asked only for construction. It is believed that a profitable arrangement for the operation of the subways can be made later, as the legislature is expected to pass an amendment to the present law increasing the length of the term for which contracts may be made. Doubt as to the city's ability to issue bonds for subway construction without exceeding the constitutional debt limit has led to another change in the method of procedure. Instead of asking for bids for the entire subway the commission has divided the Fourth avenue route into six sections. The legislature is expected to pass at this session a constitutional amendment exempting bonds for subway construction or other self-sustaining enterprises from consideration in calculating the debt limit. This plan, however, could not become operative within two years. The commission anticipates that even if the city is unable to finance an entire route funds may be secured for one or two sections so that some tangible results may be obtained this year.

Tip Over the Bushel.

"A clock without hands, be it running ever so regularly, is not more useless than a worker without expression." We agree so heartily with the amplification of this adage as put forth by the Journal of Electricity, Power and Gas, that we can do no better than repeat it, word for word: "There is no function of history that is more important than that of preventing the reduplication of effort, and from it the wise man learns by the mistakes of others. If we 'hide our light under a bushel' we not only blind ourselves with its little importance, but also compel others to work without its aid, whereas the two combined might soon make clear the way of attack. 'My light is none the less for having lit that of my neighbors.' The interchange of technical knowledge makes all richer and none poorer, and as a cold business proposition is a good paying investment, as is amply testified in the record of all scientific advance. The petty craving for credit has often overreached itself by prematurely causing the demise of the silent worker, whose efforts are thus lost to the world. The loss is the more regrettable because it is the more easily avoidable. Personal gain can or should be insured by patent. This publicity will provoke suggestions of improvement from others, which may again be turned to personal advantage."

Motor Driven Shop Tools.

As electric railway shops increase in size it becomes a more and more difficult problem to satisfactorily arrange the various shop tools and machines so that the work may be carried on progressively and with the lowest cost for labor and power. The advent of the direct-driven machine tool affords the master mechanic far wider latitude in laying out his shop than he has before enjoyed. It is stated by Dexter S. Kimball in a recent issue of the Sibley Journal of Engineering that a plant must be very small and compact when electric distribution cannot be used to advantage. The debatable point is just how far individual drive should be used as against group driving. While there has been some hesitancy on the part of machine tool builders in changing their patterns so that motors could best be used, this difficulty is now being rapidly overcome. Machine tool builders and electrical manufacturers are now united in solving the problem and it is suggested by Mr. Kimball that it will not be long until by reason of growth or consolidation machine companies will make a specialty of building complete motor-driven tools. This unity of interest is quite necessary for the highest development that may be desired from individual drive. The final answer to the question of whether individual or group drive is preferable can be made when accurate production costs are announced. Electric railway men whose shops always have current available should have

no hesitancy in thoughtfully considering the installation of individually driven tools where it is found that the system of shop arrangement can be benefited thereby.

THE BANKER AND THE ENGINEER.

The paper read before the electrical section of the Western Society of Engineers, Chicago, on April 10, by J. C. Kelsey, on "The Relation Between Banker and Engineer," should help to bring about a clearer understanding of the relative position of these two important factors in corporation financing, management and operation. That the members who were present at the meeting appreciate the responsibility of the position which engineers should occupy toward the banker on one hand and the investing public on the other is shown by the expressions of opinion in favor of further discussion of this subject. There are two classes of bankers, private and incorporated. Formerly most of the financing was done by private bankers, but with the growth of trust companies in the principal centers of population and their entry into the field of promotion, the financing of corporations has become a business in which many large banks, both state and national, have engaged. The banker fills a useful function in furnishing large amounts of capital with which important financial operations are conducted. This capital is, of course, the property of the public. The banker, if incorporated, enjoys the management of the capital because a great many individuals and corporations or business firms have confidence in his integrity. The banker, if not incorporated, has usually a relatively small amount of capital, which is entirely insufficient for his needs. He conducts his operations almost wholly on borrowed money. That is, when he negotiates the purchase of an issue of bonds, he borrows from the incorporated banks with which he does business, say, 90 to 98 per cent of the estimated market value of the bonds. The remainder of the investment he furnishes with his own capital. The banker may form a syndicate or make an arrangement for joint purchase with others who can command more capital than he has or cares to risk, thus distributing the chance of loss. In the event of such an arrangement the banker who initiated the transaction may be the manager of the syndicate and receive a commission as such.

The essential fact, however, is that one banker usually becomes identified with a public utility property as its dominating power. The nature of the relationship thus assumed should mean that thereafter the banker will seek to preserve the integrity of the property. He should strive to conserve its earnings and protect the investment of the security-holders. In practice there is a wide departure from this ideal. In his paper, published in last week's issue of the Electric Railway Review, Mr. Kelsey indicated what duty the engineer should fulfill. By means of the information obtained through frequent examination the engineer should post the banker accurately concerning every vital point of operation and management. Mr. Kelsey said: "If the management of the property is niggardly with maintenance and repair, thereby rendering the contracted renewal reserve fund insufficient, the banker can call a halt. If the management is extravagant in operation and conduct of the business, thereby endangering bond interest, the banker knows it before it is too late."

It is plain that in the past either the engineer has not advised the banker concerning the true state of affairs, or that the advice and superior knowledge of the engineer have been ignored. The wreckage of corporations and the attendant distress in certain large cities are proof of this fact. The controlling banker has assented year after year to the practice of charging renewals to capital account and has willingly sold and recommended the securities based on such operations. Sometimes a false notion of security has been added to deception in the statement of prospectuses that the bonds would be rebought from purchasers. When this statement is made what is intended is merely to convey assurance that if the purchaser desires his money again the banker will repurchase the security, provided conditions are auspicious. No banker could afford to place himself in the position of readiness to purchase again at all hazards, in hard times or in prosperity, all of the securities he had sold. If business were conducted on that basis each bond sold would constitute a liability, and, with any large volume of business, a general desire on the part of purchasers to convert securities into cash would precipitate bankruptcy.

The banker should, however, feel a definite responsibility regarding the safety of the investments, usually of savings, which he has invited. There is no legal means whereby the banker can be made to safeguard the investment, but there is every moral reason why he should do so. An untarnished reputation in this respect may reduce his profits, but should perpetuate his institution.

If there is to be reform in the banking attitude of merely buying to sell, it must be preceded by a desire in the banker to sell only good securities and to retain the merit of such securities throughout their life, with payment at maturity. To those who understand clearly the position of many banking interests in public utility corporations, it is plain that evils exist with the tacit support of bankers. Before a property has demonstrated its earning power it is necessary to give some prospects of large gain in order to interest those who control capital in the enterprise, but when a property is of assured permanent earning power there is no necessity or reason for high commissions. When there is certain earning power and definite increase in business the corporation is in a position to solicit bids from competing banking interests for all the securities of which it disposes. It is best for the corporation to take all precautions to avoid a combination of the banking bidders, for a combination of this character, such as is sometimes formed, will do away with all but the semblance of competition.

DEPRECIATION CHARGES OF THE INTERNATIONAL TRACTION COMPANY.

It appears from a comparison of the annual reports of the International Traction system of Buffalo for the years 1906 and 1907, as abstracted in the Electric Railway Review for March 23, 1907, and April 11, 1908, that this company has adopted a definite policy regarding accounting currently for depreciation. In the report for the year 1907 there is shown a charge of $269,022 on account of depreciation, which is 5 per cent of gross earnings. In the 1906 report no charge for depreciation was shown separately, but maintenance charges for that year, which were included in operating expenses, were relatively much greater than in preceding years. In the report for last year the 1906 accounts are stated in a different manner, depreciation being segregated to permit of comparison.

The report does not disclose the basis on which the amount charged for depreciation in 1906, $234,792, was determined. This sum is almost $4\frac{3}{4}$ per cent of the gross earnings from operation in 1906. Nor does it bear the same ratio to the total operating expense of that year that the depreciation charge for 1907 bears to operating expenses in 1907, although in both years the depreciation charges are very close to 8 per cent of the total of operating expenses and depreciation.

The table of earnings and operating expenses (operating expenses are for International Railway and Crosstown Railway only, but are virtually the totals for the whole system) shown in American Street Railway Investments for the years 1903 to 1906, inclusive, show charges to operating expenses on account of maintenance which in percentage of gross receipts are as follows:

1903.	1904.	1905.	1906.
7.52	10.00	9.48	14.17

The last report of the company does not show mainte-

nance separately from operating expenses, but assuming that maintenance in 1907 bears the same proportion to maintenance in 1906 that depreciation allowed for 1907 bears to depreciation charges of 1906, the total of maintenance and depreciation for the year 1907 is 15.03 per cent of gross receipts.

The 5 per cent allowed is the same proportion of gross as charged currently by the United Railways of St. Louis, but is low compared with the provision made by the Twin City Rapid Transit Company of Minneapolis, which has charged an average of 8 per cent of gross earnings for depreciation for the last three years, and with The Milwaukee Electric Railway & Light Company, which has charged 10 per cent of gross earnings for 11 years.

ANNUAL REPORTS.

United Railways of St. Louis.

Passenger revenue of the United Railways of St. Louis amounted to $10,659,037 in 1907, an increase of 18.5 per cent over 1906, when no allowance is made in the 1906 accounts for the operations of the St. Louis & Suburban Railway, the results of which are included in the totals for 1907. Including the figures of the St. Louis & Suburban Railway for comparison, gross earnings and other income increased 5.25 per cent and operating expenses, taxes, reserve fund appropriations and depreciation charges increased 10.04 per cent. The Suburban system was merged into the United Railways system on January 1, 1907. Omitting the St. Louis & Suburban figures for 1906 the operations of the United Railways for two years, slightly rearranged, with a comparison, follow:

	1907.	1906.	Increase.
Gross earnings	$10,771,164	$9,093,740	$1,677,424
Operating expenses and taxes	6,503,700	5,111,731	1,391,969
Net earnings	$ 4,267,464	$3,982,009	$ 285,455
Other income	57,573	52,608	4,965
Total net income	$ 4,325,037	$4,034,617	$ 290,420
Interest	2,778,023	2,377,477	400,546
Net divisible income	$ 1,547,014	$1,657,140	*$ 110,126
Depreciation	540,182	455,681	84,501
Balance	$ 1,006,832	$1,201,459	*$ 194,627
Preferred dividends	649,160	649,160	.....
Surplus	$ 357,672	$ 552,299	*$ 194,627

*Decrease.

The charge for depreciation is on the same basis as in the previous year, amounting to 5 per cent of the gross revenue, carried each month to a reserve fund. All but $5,564 of the amount credited to the account was expended during the year. The remaining sum was added to the amount on hand in this fund, making a total balance of $183,619. The injuries and damages reserve fund amounted at the close of the year to $571,035. The treasury holds as an investment for this fund 5,000 shares of preferred stock of the company. A small percentage in excess of the actual fire insurance premiums paid was charged against the operating expenses during the year, increasing the fire insurance reserve fund at the end of 1907 to $113,638. The treasury held 1,000 shares of the preferred stock of the company for investment for this fund.

John I. Beggs, the president, states that the gross earnings and other income for the year show a very gratifying and satisfactory increase over the preceding year, and that the net earnings are very good when consideration is given to the following facts:

1. On January 1, 1907, the St. Louis & Suburban Railway became a part of this company's system, hence, in order to get a fairly accurate comparison for 1907 with the year 1906 it was necessary to incorporate the results of operation of the St. Louis & Suburban system in the figures for 1906.

2. The physical property of the St. Louis & Suburban system was in very bad condition, requiring large expenditures to place it in reasonably good operating condition; further extraordinary outlays will be necessary during the year.

3. No provision had been made in the Suburban company's accounts for depreciation, whereas this year 5 per cent of the gross earnings have been charged, making a difference of about $57,000.

4. Adequate reserves were never set up in the Suburban's accounts for fire insurance, injuries and damages and other contingent liabilities.

5. A decided increase in the cost of labor and material has substantially increased the operating and maintenance costs for the year 1907.

6. The general financial stringency and depression in business during the latter months of the year somewhat reduced our gross earnings, and whatever reduction of gross earnings we suffer must all come out of net earnings, as the cost of operation remains practically the same.

The company sold at par $1,200,000 of 5½ per cent 2-year collateral trust notes, secured by a deposit of $1,500,000 of general first mortgage 4 per cent bonds and $500,000 of preferred stock of the United Railways Company. The proceeds of these notes, with $300,000 raised on other notes, retired $1,500,000 underlying Citizens' Railway Company 6 per cent bonds, which matured on July 1, 1907. The $1,500,000 of 4 per cent bonds used as collateral security for the notes were reserved under the mortgage for retirement of the underlying bonds, but the issue of notes was made because it was "impossible to sell the 4 per cent bonds at any reasonable figure, owing to the financial conditions prevailing during the year." The funded debt outstanding was $59,180,000 on December 31, 1907, a reduction of $300,000. The stock issues were unchanged at $19,983,200 preferred and $24,913,800 common. The balance sheet as of December 31, 1907, shows $1,244,500 bills payable.

The company owned at the end of the year 457 miles of single track, of which 350 miles were in the city and 107 in the county of St. Louis. Of the total 448 miles were in operation. The woodworking and paint shop is now in full operation and finished 27 new cars during the year. Nine additional cars are in process of construction and others will be added during 1908. Mr. Beggs makes the following reference to wages:

In order to encourage our old conductors and motormen to continue in the service, the following rates of pay have been established, effective January 1, 1908: Those who have been continuously in the service of the company for a period of four years will be paid at the rate of 24 cents per hour; for five years or more continuous service, 25 cents per hour. All others will continue to receive 23 cents per hour, the rate which they had been receiving, until the completion of their fourth and fifth years' continuous service, when the higher rates will apply. It is also intended to establish a graded rate of pay for motormen and conductors entering the service on and after January 1, 1908, which we believe will be more equitable than placing new and inexperienced men on the same footing as our trained men.

Statistics of traffic follow:

	1907.	1906.	Increase.
Revenue passengers	216,779,638	206,409,101	10,370,537
Transfers and passes	97,165,511	85,113,685	12,051,826
Total passengers	313,945,149	291,522,786	22,422,363
Percentage using transfers.	42.34	38.83	3.51
Average fare per passenger, cents	3.39	3.47	*0.08

*Decrease.

Central Electric Accounting Conference Meeting Called.

M. W. Glover, chairman of the Central Electric Accounting Conference, has called a meeting to be held at the Lima house, Lima, O., on April 23. The meeting is called at the request of F. D. Carpenter, president of the Central Electric Railway Association, and it is desired to have present the accounting officers and other officials of companies in both the conference and the association who are interested in the proposed accounting system of the interstate commerce commission. Representatives of electric railways in the central territory that are not members of the conference or the association, but are interested in the tentative classifications of accounts, are also invited to be present.

Communications

INDETERMINATE FRANCHISES FOR PUBLIC SERVICE CORPORATIONS.

To the Editors:

Speaking only for myself, in purely a personal way, I favor the idea of indeterminate franchises for public service corporations. It seems to me that the idea embodied in the public service commissions law of this state, preventing the capitalization of any franchise at a sum greater than the amount actually paid to the state, or minor governmental body granting the franchise, is thoroughly sound and that the condition underlying the continuance of the grant of any franchise should be the furnishing of adequate and satisfactory service for a reasonable remuneration. Whenever the state or municipality finds that such service is not being rendered, it ought to be in position to revoke the franchise. With this must go, of course, provision for recompensing the corporation for its actual investment in case the franchise is canceled.

WILLIAM J. MEYERS,
Statistician New York Public Service Commission, Second District.

Albany, N. Y., April 11, 1908.

CLASSIFICATION—CHANGES IN ACCOUNTING AND OPERATING METHODS NOT JUSTIFIED.

To the Editors:

The business of this company is that of a general electric business, comprising power for mills in factories, municipal and commercial lighting, and a street railway, in addition to which the company owns and operates an ice plant. The conditions existing here are not similar to those in other places, and naturally our business has been organized and is operated in such a manner as will best meet local conditions and prove most economical. The form of monthly report which we are now using meets our own requirements very well, but the classification does not at all conform with that which is proposed by the interstate commerce commission for the use of all companies, and the latter classification would not suit our conditions.

To compel us to follow the proposed classification would mean a complete reorganization of our system of accounting and necessitate an increase and change in our office force. It would likewise entail some changes in our operating forces and methods, which are at present consolidated for reasons of economy. We think that from our point of view such changes are not justifiable.

We find already that to endeavor to comply with all the details required by national and state governments adds a very considerable amount of work to the regular requirements of business.

In this matter of classification the line of demarcation between large and small companies is a very broad and vital question, which should call forth a very thorough investigation of the business of individual companies, and we seriously doubt the wisdom or the ability to base this line of demarcation upon the gross revenues of the companies concerned. We do not think that the distinction between large and small companies can be, or should be, based altogether upon the amount of gross revenue.

Conditions of operation between local systems in towns and large cities and interurban roads are not, and cannot be said to be, entirely the same. In our case the railway is but a part of our electric business, the greater portion of which—power, light, etc.—is not included in the proposed classification, because it is distinct from the railway operation. The construction of our lines is such that we cannot separate the railway from lighting and power service, because the transmission wires are carried upon the same lines and poles; this same joint method of service prevails throughout the entire conduct of our business wherever it is practicable from the standpoint of economy in the matter of construction or operation. We think this is true of other towns and smaller cities.

It is not our purpose to oppose any system that will work out for the best interest of this business, but thus far we do not see where any great benefit is to come from the change. We do think we can see much additional work and expenditure in our office without a corresponding return, and possibly the reorganization of operating conditions to meet the proposed requirements.

THE FRIES MANUFACTURING & POWER COMPANY,
By B. J. Pfohl, Secretary and Treasurer
Winston-Salem, N. C., April 8, 1908.

CLASSIFICATION—NEW HAMPSHIRE RAILROAD COMMISSION AND INTERSTATE ACCOUNTING SCHEME.

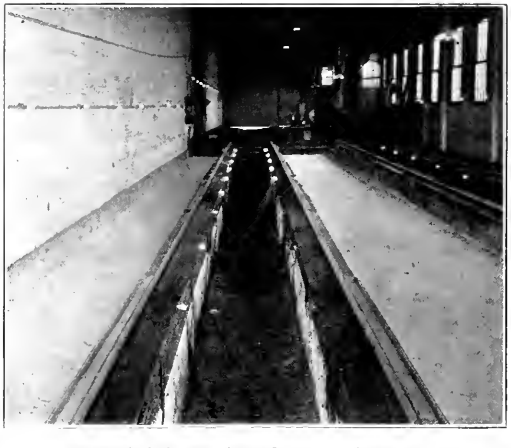
To the Editors:

The system of accounting and the form of reports we have been using for electric railways are satisfactory to us, and while they may be modified somewhat to make them uniform with those of states contiguous to New Hampshire, we see no need of material change. Furthermore, as all our roads are intrastate we do not feel that we need the assistance of the interstate commerce commission in ascertaining and reporting the condition and the results of operation of the roads.

H. M. PUTNEY,
Chairman New Hampshire Railroad Commission.
Manchester, N. H., April 14, 1908.

WHITENING SHOP FLOORS WITH LIME.

The accompanying halftone engraving is made from an unmanipulated photograph, showing one repair bay of the Aurora Elgin & Chicago Railroad Company's shops at



Aurora Elgin & Chicago—Shop Floors Whitened with Lime.

Wheaton, Ill. This view is reproduced to show the very satisfactory method for increasing the illumination under car bodies by keeping the floors white. To maintain the floors in this clean, white condition, so that the greatest amount of light will be reflected under the car bodies, they are swept with slacked lime. Before applying the lime the cement floor is thoroughly cleaned and then a quantity of the lime is sprinkled over the surface and swept off with a broom. By first cleaning the floors one coating will serve for a dozen sweepings. We are indebted to E. P. Doyle, master mechanic, for this interesting shop practice.

SHORT TALKS WITH THE CLAIM INVESTIGATOR—II.

BY F. W. JOHNSON, ASSISTANT GENERAL CLAIM AGENT PHILADELPHIA RAPID TRANSIT COMPANY.

It may be accepted as an established fact that opportunities to go wrong greet the claim man with greater frequency and in a greater variety of form than is ordinarily encountered by young men engaged in other branches of commercial life.

To one who has been associated with claim work for any considerable period of time it is not a difficult matter to readily call to mind numerous instances in which investigators and inspectors who gave every promise of bright futures in the work, from one cause or another, have "blown up" just when success seemed within their grasp.

Of the many pitfalls which fate seems to strew with a lavish hand along the paths traveled by young men in claim work none probably has proved more uniformly unfortunate in its results or more far-reaching in its effects than has the use of intoxicating liquors.

Far too often has indifferent and generally unsatisfactory service followed hard upon the heels of this formidable obstacle to success. Again and again has it stamped "failure" across the careers of many otherwise successful claim investigators of the past. From a purely business point of view, stripped of all sentiment, the subject is a proper matter for careful thought upon the part of every young man engaged in claim work, whether it be as investigator, inspector or adjuster.

Use of Liquor Detrimental in Claim Work.

Given a vacancy in the claim department of the average street railway company, with two men eligible for promotion, one known to be a drinking man, the other temperate, the prediction is a safe one that in nine times out of ten preference will be given to the latter man.

And it is right and proper that such should be the case. Railroading and the use of intoxicating liquors never have successfully gone hand in hand, and never will. This applies with equal force to that branch of railroading which comes within the scope of the claim department. The fact cannot be denied that in claim and accident work the temperate man has a distinct advantage over the intemperate one.

The theory is timidly advanced, occasionally, that a moderate amount of drinking is necessary in claim work in order to secure results. Such a claim is not justified by experience and is wholly without foundation in fact, arguments to the contrary notwithstanding.

It is upon this very point that some investigators entertain mistaken ideas regarding claim work. In their earnestness to show results from their labors they apparently see no harm in resorting to the use of liquor in order to pave the way to the securing of a statement, or of a release. Would they but devote a little careful thought to the matter they could not but realize that signatures obtained under circumstances such as these are of little practical value. More often than not they possess a "boomerang" attachment that reflects but little credit upon the principals, when the real facts are given publicity.

Taken in its best light, an advantage gained in this way has but a temporary, uncertain, doubtful value. Neither the company nor the investigator derives any permanent good from such work. It is indeed difficult to understand the foundation for such a theory as this. To one who has the best interests of claim work at heart rather the reverse would seem to be true.

Many a well-meaning investigator of the past has made strenuous efforts to be a "good fellow," imagining the while that he was acting in the best interests of the department, when as a matter of fact he really was playing the part of a bright and shining "mark" for the other side. The methods of 20 years ago in claim work have outlived their usefulness.

The investigator should bear ever in mind the fact that the success or failure of matters involving the possible expenditure of thousands of dollars depends directly upon the intelligence and faithfulness with which he performs his portion of the work. His is the task of laying the foundation for the proper investigation, and defense if necessary, of such matters as are entrusted to him. Upon the facts as gathered by him will depend the company's future course. If he fails, and his work proves defective, irreparable damage to his employer's interests, as well as to his own, follows as a natural result.

The question may be asked in all fairness: "Of what value to an aggressive, up-to-date claim department is an investigator who crawls into the office 30 minutes late in the morning, with a hand that is shaky, an eye that is shifty, a manner that is listless and a brain that is dulled?"

It is well for the investigator to recollect that the straight road to success in claim and accident work is only found and followed by the aid of a clear mind and a sound, healthy body, both of which enable their possessor to work under high tension without breaking down in some vital direction. Also, that the head of the average claim department doesn't knowingly entrust the investigation of the company's accidents to investigators who are erratic and unreliable through the use of liquor. The keenest, most successful investigators and inspectors invariably are temperate men. They possess that invaluable quality of reliability so much sought by the heads of departments. Hence it easily follows that the most important cases are assigned to men of this type.

An as instance of just the reverse, witness the humiliating predicament in which an investigator found himself some years, ago, while engaged upon the investigation of a serious collision of cars.

At the close of the day's work he chanced to meet certain friends. Liquor was indulged in and, in the natural course of events, discretion was thrown to the four winds. With a cheap imitation of good-fellowship in possession of his befuddled brain, he proceeded to take the entire party into his confidence, entertaining them with a recital of the details of the accident which had been under his investigation.

Apparently his friends were deeply interested in his narrative, for they were observed to make frequent notes of his remarks. They furthermore availed themselves of his kind offer to examine his papers, in order to substantiate certain of his claims. As a natural result of his stupidity an avalanche of claims descended upon his company the following week, the clues to claimants having been secured as above described.

The instance is not cited in the light of a "horrible example," but rather as a typical illustration of the actual results obtained by more than one young man in claim work in the past, in his efforts to achieve results via "the down and out route." An unbridled tongue can hardly be reckoned as a valuable asset in claim and accident work.

Some years ago a young man was admitted to the claim department of a steam railroad system located in the middle west who gave promise of developing into valuable timber for the department. Upon the morning of his first day in the office he was directed to appear before the head of the department for further examination. The examination was brief, to say the least.

"Young man," said he, "do you drink?"

"I do not, sir."

"Very good. Just remember that I will attend to the drinking for this department."

Each proved true to his word. One traveled east, the other west. The investigator of several years ago is today assistant general manager of the entire system.

As a cold, hard, business proposition, the use of intoxicating liquor has proved detrimental in every way to the best interests of the young man in claim work, whether he be investigator, inspector or adjuster.

THE BROADWAY CAR HOUSE OF THE INTERNATIONAL RAILWAY COMPANY.

BY THOMAS PUMPREY, ENGINEER.

Although the rolling stock of the International Railway Company of Buffalo, N. Y., has kept pace with its rapidly growing traffic, the company's car house facilities were inadequate until recently, despite the fact that a newly built car house at Cold Spring greatly increased the capacity for housing cars. A description of the Cold Spring structure was published in the Electric Railway Review of July, 1906. It is not surprising, therefore, that the International Railway Company has found it necessary to erect during the past year another car house which will hold 108 cars, each 46 feet long, with an open storage yard along the south side of the building which will accommodate 135 cars, each 46 feet long, over which an extension of the car house will be built at some future time. A total storage capacity of 243 cars will therefore be available at the new station.

As important division headquarters for the Buffalo lines are centered in this car house, it is provided with offices, and a trainmen's room for the traffic department; also a heating plant, storerooms, oilrooms, etc.

General Dimensions and Track Arrangement.

The property on which this car house is located has a total length of 698 feet 4 inches fronting on Broadway with a uniform width of 270 feet 8 inches extending back to Stone street. The car house is 561 feet long and has a total width of 148 feet. It is divided longitudinally into two equal bays, each 56 feet wide, with the offices and storerooms, 32 feet wide, running along the Broadway front. The car house is also divided transversely by steel rolling fire doors, thereby separating the building into four sections, so that a fire may be confined to any one section. A driveway from Broadway in the center of the building would allow the ready entrance of fire fighting apparatus to all sections of the building.

Cars enter the house at the east end, pass over the pits where they are inspected and cleaned and then pass to the storage tracks in the west end of the house ready for service.

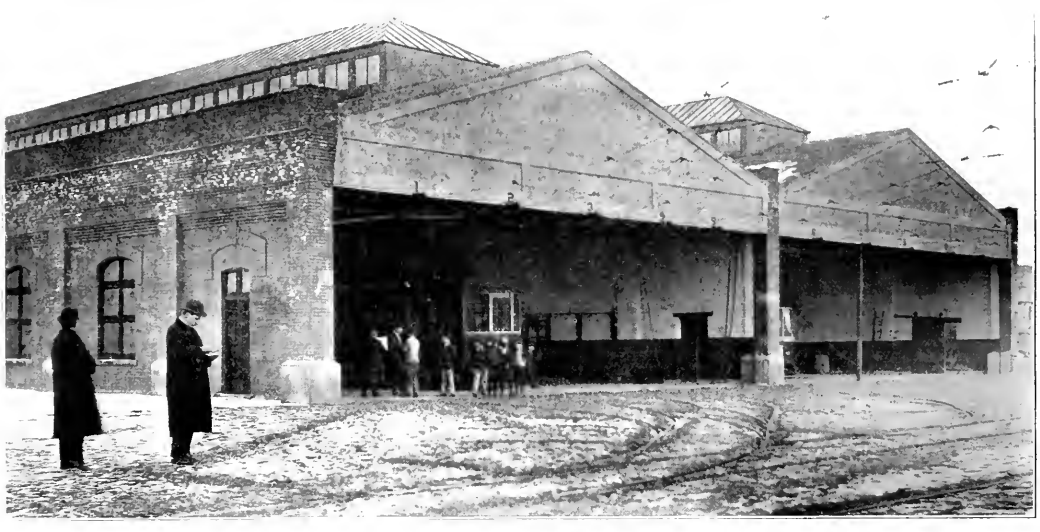
The special track work from the street to the property line, also the crossover in Broadway, is 9-inch girder work, built by the Pennsylvania Steel Company, and is paved with block stone. All the special work on the property is 60-pound T-rail, guarded, and paved with old common stone. The straight rail over the inspection pits is 9-inch girder Lorain Steel Company's section 94-313. The rail in the west section of the building is 60-pound A. S. C. E. and that in the storage yard is old 6-inch girder rail turned backward.

The track throughout the house is level and there is a uniform height of 18 feet to the bottom of the roof trusses. The track spacing over the pits is on 11-foot centers, that in the west half of the building 10-foot centers and the storage track in the yard has 10-foot 6-inch centers.

Structural Features of the Car House.

All foundation walls are of concrete, projecting 6 inches above grade. Those in the storage half of the building are 4 feet deep and in the pit end they are 5 and 9 feet deep. The pit walls, floors and piers are all concrete; also all floors except in the office and the trainmen's room. The office floor is of 1⅛-inch maple and that of the trainmen's room is iron-spotted buff brick.

All roof trusses are spaced 17 feet 6 inches centers and are carried on brick piers 2 feet by 2 feet 8 inches in size. These piers all have cap stones and two binder blocks 12 inches thick. The brick wall between the piers is 8 inches thick and all dividing partitions are carried up as fire walls 3 feet above the roof and are capped with 8-inch glazed tile coping.



Broadway Car House, Buffalo—Front End of Car House.

The roof is constructed of 6 by 12 inch and 4 by 12 inch yellow pine purlins and 2-inch matched hemlock roof plank with a roofing of 5-ply felt and ¼ inch of actinolite. The gable ends of the building and also the gables over the steel rolling doors in the center of the building are filled in with expanded metal and cement plaster 1 inch thick. The lantern skylights on the roof are all made with structural iron frames covered with No. 24 galvanized iron; the glass is ¼ inch, ribbed in sheets 18 inches wide by the full length of side pitch of skylight. All the side sashes in skylights are pivoted and operated in groups from the side walls near the floor.

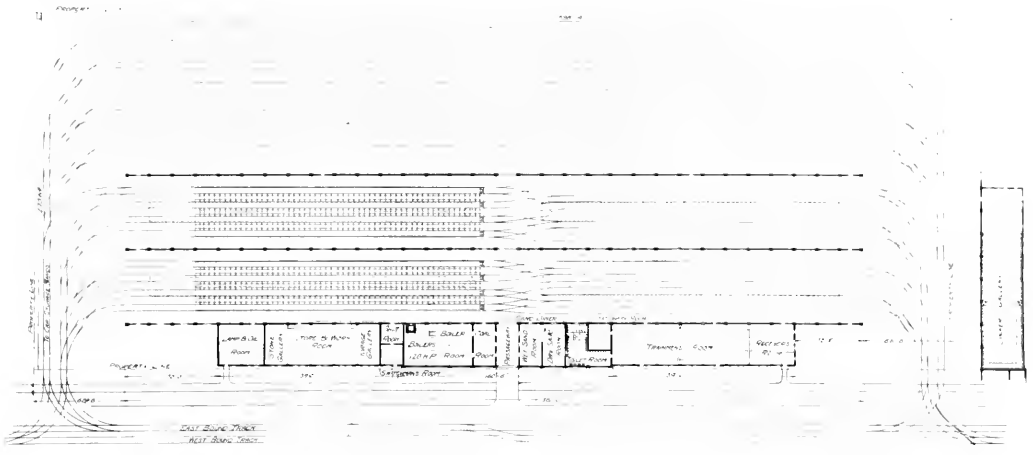
Lighting and ventilating car houses by means of a lantern skylight has been found very satisfactory, the car house being well lighted, with practically no dark corners. The general lighting of the car house at night is provided for by six

50-candlepower incandescent lamps placed on the bottom of each truss and controlled from a switchbox on the side walls of the building. All lighting wires are run in metal conduit and the lamps are hung from conduits.

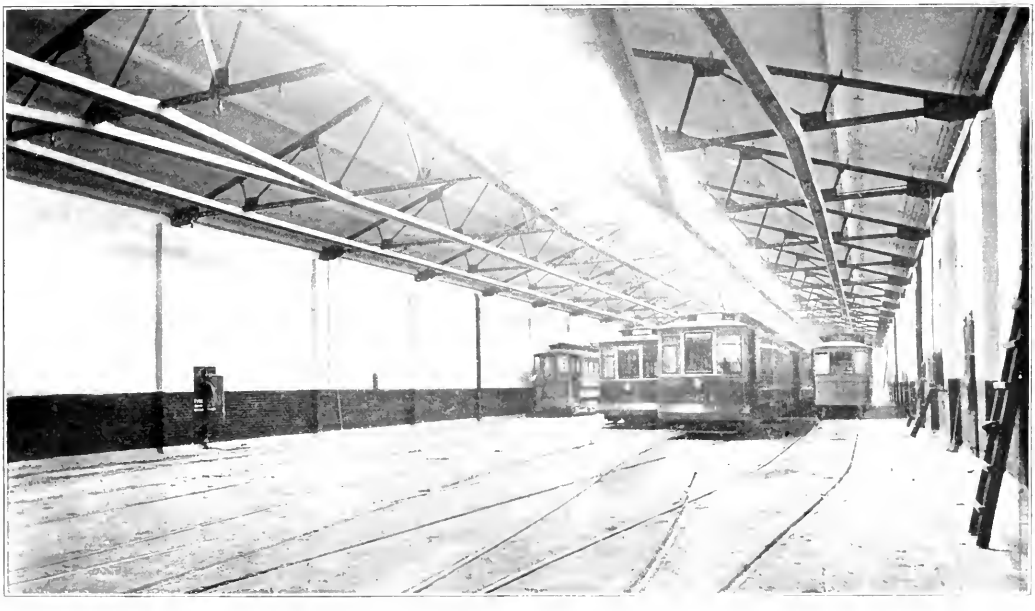
The building is inclosed at each end and divided in the center by steel rolling doors made by the Kinnear Manufacturing Company, Columbus, O. These doors vary in width from 14 feet to 28 feet and are 15 feet high. They are fitted at the top with trolley wire hangers, which allow the car to enter or leave the building without removing the pole from the wire. Each set of doors across the building at the ends and in the center is raised and lowered by a 3-horsepower motor, each door being raised by a friction clutch and a forged link chain.

The drainage of the floor of the car house and of the large inspection pits is provided for by grading the floors to a concrete gutter 12 inches wide across the pits and car house floor. This gutter is connected at one end to the sewer by means of a 4-inch iron pipe projecting 4 inches above the bottom of the gutter, thus allowing all dirt to settle so that only the water is carried into the drains.

The trench is covered with ½-inch perforated wrought-iron plates in long sections. There are small concrete catch basins with wrought-iron covers in the oilroom, boiler room, pump pit and toilet rooms. All drains under the inspection pits or office and workrooms are standard cast iron. The toilet fixtures are more substantial and better ventilated than those usually found in a car house. All fixtures are J. L. Mott's



Broadway Car House, Buffalo—Plan Showing Arrangement of Rooms, Buildings and Yard Tracks.



Broadway Car House, Buffalo—Interior of One Bay Looking Toward Front.

colonial earthenware. There are four separate wash basins, two blue enameled sinks and one earthenware slop sink. In the east end of the trainmen's room is a porcelain drinking fountain fitted with a crystal stream nozzle; with this nozzle it will not be necessary to use cups.

The city water main in Broadway is tapped twice—with a 2-inch pipe for general purposes and with a 4-inch pipe exclusively for fire purposes.

The stand pipes are of 2-inch wrought-iron pipe, galvanized and fitted with Chicago hose valves and 50 feet of unlined linen hose on an improved hose reel.

Pit Construction.

The pits are what is known as open construction, it being possible to pass from under one track to another. They vary in depth from 4 feet 9 inches to 5 feet below the top of the rail. The walls are of concrete 12 inches thick and the piers of concrete 12 by 16 inches in size with an extra width for footing of 6 inches all around. There are placed in these piers anchor bolts for holding the rail down, hooks for supporting the radiators, $\frac{3}{4}$-inch conduit for running the lighting wires and a $\frac{1}{2}$-inch twisted steel rod in each corner of each pier. The rail is supported directly on top of piers and the walk between tracks is made of $\frac{3}{8}$-inch checker plate 36 inches wide, supported on 4 by 4 by $\frac{7}{16}$ inch angles attached to the rail, the walk being 4 inches below the top of the rail. The pits are heated by colonial wall radiators of 7 square feet heating surface, placed on two sides of each pier. These are supplied by steam mains carried under the checker plate walk. The return pipes carrying condensation from the heaters are placed in 4 by 6 inch concrete trenches at the back of the piers. These trenches are covered with $\frac{1}{4}$-inch checker plates.

The pits are lighted by 16-candlepower lamps placed on two sides of the piers between the heaters and the rail base. All wires are lead covered, run in $\frac{3}{4}$-inch conduit, through piers to cast-iron junction boxes in the floor at various points, where they connect and then run to switch boxes on the brick wall of the car house above the main floor. Access to the pits is by steps at each end of each track, made of $\frac{1}{2}$-inch plate stringers and checker plate treads.

Water supply for car washing over the pits is provided for by placing five $\frac{3}{4}$-inch hose connections across each end of the pit and across the center, brought up alongside the piers to the top of the rail.

About the center of each pit will be placed 6-inch hinged rails in each track to allow the ready removal of wheels, armatures, etc., these being lowered by using telescopic hydraulic motor lifts. A 1½-ton electric hoist, supported by a roof truss which has been reinforced for carrying the extra load, is located directly over these hinged sections of track. This hoist will be used to carry heavy material to any track on which cars are being repaired.

The details of the track pits and track construction are nearly identical to those in the Cold Spring car barns, which were described on page 404 of the Electric Railway Review for July, 1906. The exterior elevations of the new car barns are also similar to those of the Cold Spring barns, and reference to the article mentioned will also show the details of the Kinnear rolling steel doors and the hinged posts at either end of the structure.

Steam for heating the pits, offices and workrooms and for drying sand is supplied from a boiler plant consisting of two 120-horsepower boilers, which can be used separately or together, as the severity of the weather demands. All condensation is returned to the boilers by two pumps located in a pumproom 9 feet below the boiler room floor. Fresh water is also supplied to the boilers through these pumps.

Broadway Car House, Buffalo—Trainmen's Quarters.

Storeroom.

A storeroom 32 by 86 feet in size has been conveniently located to the inspection pits and is used for a workroom and storage for repair material.

There are also two galleries, one at each end of the room, used for storing sashes, stops and other materials which are used on the cars only in winter. These galleries are reached by an iron stairway. There are also placed near this room 48 metal lockers made by the Merritt Company of Philadelphia which are used by the repair men. A small direct-driven lathe, placed in this room, serves for truing commutators, axles, etc.

The oilroom has been placed near the east end of the building on the Broadway front and is thoroughly fireproofed.

it is fitted with metal lamp racks and barrel stands, also apparatus for testing electric headlights.

Sand is delivered to the wet sandroom located near the center of the building and there dried by a steam coil drier made of about 2,000 feet of 1-inch pipe heated with steam at boiler pressure. This drier is taken care of by the fireman who tends the boilers.

Offices and Trainmen's Quarters.

As this car house will form important division headquarters, accommodations have been provided for a division superintendent, receivers and trainmen.

The trainmen's room is 31 by 105 feet in size. An illustration of this room is presented. The locker gallery around this room is of iron and concrete construction, reached by two spiral stairways, one on each side of the room. This gallery is provided with 215 metal lockers 12 by 12 feet square and 60 inches high. They are all numbered consecutively and have Yale & Towne key locks, all of which can be opened by one master key.

These rooms are heated by floor radiators, 26 inches high, placed under the windows, supplied from a steam main under the roof trusses, with return pipes under the brick floor in split tile. General lighting is effected by 50-candlepower lamps suspended from the bottom of the roof trusses and the under side of the locker gallery. There are pool tables, card tables, writing and reading tables, seats, etc., in this room. All windows, except in the division superintendent's office, are glazed with translucent glass and the windows of the office are protected by outside iron grilles.

The car house and offices as described were designed and built under the charge of the writer, reporting to T. W. Wilson, general manager of the International Railway Company.

CALIFORNIA TYPE CARS BUILT AT OAKLAND.

In the 12 months following the time of the earthquake at San Francisco the Oakland Traction Company built in its Emeryville shops 100 cars complete, with the exception of the motors and brake equipments. A type of city car, of which 20 with their trucks have been built in these shops, is illustrated by the accompanying side elevations, sections and plan views. This car is of the part open and part closed type which has been found especially satisfactory for operation in the California climate.

The underframing of the car comprises two steel center sills of I-beam section extending from end to end, and four wooden sills, the outer of which are reinforced by ½ by 8 inch steel plate. The overall length of the car is 48 feet 5 inches and the width 8 feet 9½ inches. A car of this type seats 52 passengers.

For this type of car body in city service each of the two trucks is equipped with two GE-70 motors with a gear ratio of 64 to 22. Straight air brake equipments are used and K-6 platform control. The cars complete weigh 38,000 pounds each.

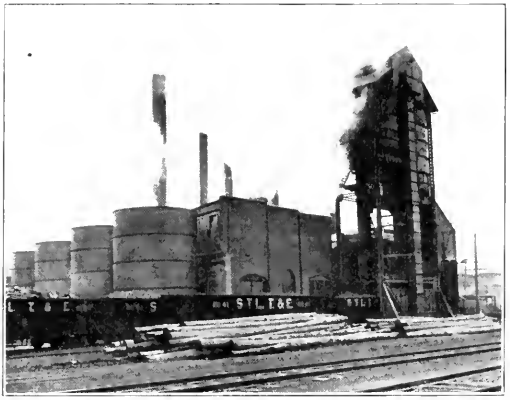
Michigan Electrical Association. Annual meeting, Grand Rapids, Mich., August 18 to 21.

The Chicago City Railway placed 40 new pay-as-you-enter cars in operation on the State street line on Sunday, April 12. The company now has 265 of this type of cars in service, 125 on the Cottage Grove avenue line and 100 on Indiana avenue.

POWER GENERATING AND DISTRIBUTING SYSTEMS OF THE UNITED RAILWAYS COMPANY OF ST. LOUIS.*

BY E. D. SMITH, SUPERINTENDENT

The United Railways Company of St. Louis operates 456½ miles of track, of which 350 miles are in the city proper and 106½ miles in St. Louis county adjoining. Approximately 1,000 cars are operated on these lines during the period of heaviest traffic. Of these cars approximately 960 are operated on the city lines, the remainder on the different county lines. The current required to handle the maximum load is about 70,000 amperes at 600 volts, or 42,000 kilowatts. Of this power 13,000 kilowatts are purchased from the Union Electric Light & Power Company and transformed in our substations, the remainder being generated and transformed in our power and substations.



United Railways of St. Louis—De Hodiamont Power Station.

Generating Equipment.

The power-generating equipment of the United Railways Company, exclusive of power purchased, consists of three stations containing direct-connected engine-driven generators, both alternating and direct current. A general description of these stations individually will perhaps be the most appropriate method of bringing out the different features of each I shall consider them in the order of their capacities.

The "central" power station is located at Park and Vandeventer avenues. This station is entirely a direct-current station. It contains four 2,250-kilowatt 600-volt generators, direct connected to 36 and 70 by 60 inch cross-compound condensing engines; two 1,500-kilowatt 600-volt generators, direct connected to 32 and 62 by 60 inch cross-compound condensing engines; and one 600-kilowatt booster, direct connected to one 22 by 42 inch twin engine.

This station has two boiler rooms, one boiler room containing 16 (4,000 square feet) O'Brien water tube boilers, equipped with Green traveling chain grates; the other boiler room containing eight (3,000 square feet) and six (3,500 square feet) Stirling boilers, equipped with Hawley down-draft furnaces.

A cooling tower installation is found in connection with each station, inasmuch as it is necessary to take water from the city mains in each instance. This installation of cooling towers is one of the largest, if not the largest, in the country. It consists of 12 Worthington cooling towers, each 20 feet in diameter, 32 feet high, and having a capacity of 28,000 pounds of steam per hour, giving a total cooling tower capacity of 336,000 pounds of steam per hour. The system is guaranteed to handle this amount of steam and maintain a vacuum of from 22 to 26 inches. The condensing plant is equipped with one 48-inch and one 36-inch Worthington jet condenser, the two condensers and their hot wells being equalized. The water in the condensing plant is handled by six 16-inch centrifugal pumps, direct connected to slide valve engines, the exhaust steam from these engines being used in the heaters for heating the feed water.

The electrical equipment of this station is Westinghouse throughout. The engines were built by the Fulton Iron Works of St. Louis.

Coal and ashes are handled by the McCaslin pivoted bucket conveyor, which has a capacity at normal speed of about 70 tons an hour. This conveyor is so installed that coal and ashes may be handled simultaneously, the handling of one not interfering in any way with the handling of the other, the coal being dumped into the bunkers before the conveyor descends into the basement to take up the cinders.

The switchboard in this station is located in a separate room above and to the north of the engine room, the operator being able, when at the machine board, to view the entire engine room.

The "Northern" power station is located at Second and Salisbury streets. This station contains two 2,250-kilowatt 600-volt direct-current generators, direct connected to 36 and 70 by 60 inch cross-compound condensing engines; two 1,200-kilowatt 6,600-volt three-phase 25-cycle alternators, direct-connected to 28 and 54 by 60 cross-compound engines. Two 800-kilowatt direct-connected simple units are now being installed in this station.

The boiler equipment of this station consists of 16 (4,000 square feet) O'Brien water tube boilers, equipped with Green traveling chain grates.

This station is also equipped with a condenser and cooling tower installation, the cooling towers in this case, however, being located on the roof of the building. The condenser equipment consists of two (10,000 square feet) Wheeler surface condensers, the condensing water being handled by two compound single-acting Blake pumps, having steam cylinders (14 and 24 by 24 inches), with a 30 by 24 inch water cylinder. The cooling tower equipment in this installation is of the Barnard type. There are four towers, each 36 feet 3 inches high, 26 feet 4 inches long and 15 feet 3 inches wide, having an individual capacity of 27,000 pounds of steam per hour, making a total cooling capacity of 108,000 pounds of steam per hour, which quantity of steam the system is guaranteed to handle and maintain from 22 to 26 inches of vacuum.

The electrical equipment of this station is General Electric throughout. The engines are of Fulton Iron Works make. There are two separate exciter sets for the alternators, one being driven by a 600-volt direct-current motor; the other is induction motor driven.

The coal storage plant in this station is across the street from the power station proper, being connected by a bridge some 60 feet above the sidewalk, through which the coal conveyor runs and delivers coal into the bunkers over boilers. The coal conveyor in this case is also of the McCaslin pivoted bucket type, being notable, however, for its length. Its total length is 1,320 feet.

United Railways of St. Louis—Spring Avenue Substation and Emergency Station.

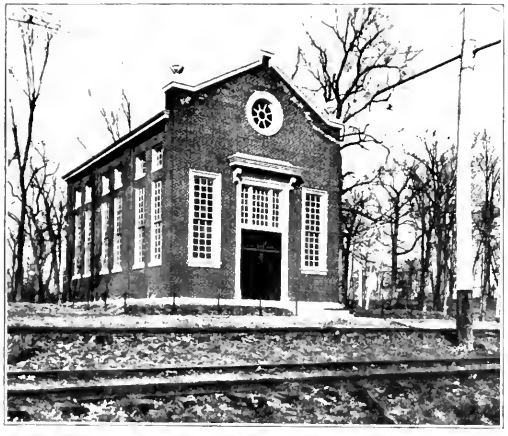
The "De Hodiamont" power station is located at Maple and Hodiamont avenues. This station is the last power station acquired by the United Railways Company, being formerly the power station for the St. Louis & Suburban Railway system, which system was taken over by the United Railways Company, January 1, 1907. The station contains three 1,200-kilowatt 6,600-volt three-phase 25-cycle alternating-current generators, direct connected to 30 and 50 by 60 inch cross-

*Abstract of paper read before the St. Louis section, American Institute of Electrical Engineers, April 8, 1908.

compound engines; four 800-kilowatt 600-volt direct-current generators, direct connected to 32 by 60 inch simple engines.

The boiler plant at this station consists of 15 4,000 square feet) O'Brien water tube boilers, equipped with the Jones under-feed stokers.

When this plant was acquired it had been operating as a non-condensing plant. We at once began the necessary preparation and now have a cooling tower and condenser installation practically completed. This condenser plant consists of one Alberger centrifugal condenser, having a 54-inch exhaust steam connection, the water from which is handled by one 24-inch centrifugal pump, driven by two Westinghouse high-speed engines, operating at 250 revolutions per minute. The cooling tower installation consists of four Alberger cool-



United Railways of St. Louis—Creve Coeur Substation.

ing towers, having a capacity of 50,000 pounds each, or a total capacity of 200,000 pounds of steam per hour. Handling this amount of steam a vacuum of 25 inches is guaranteed.

All electrical equipment in this station is of the General Electric type, the engines being of three different types, namely, Fulton Iron Works, Allis-Chalmers and Hamilton. The coal and ashes in this plant are handled by a Link Belt pivoted bucket conveyor in connection with a Link Belt gravity discharge elevator, it being arranged so that coal and ashes can be handled simultaneously.

Substations.

In the order of their capacity the different substations will next be described:

The "Central" substation is located at 1711 Locust street, near the heart of the downtown district. It contains eight 1,000-kilowatt 600-volt six-phase rotaries; also one 5,000-ampere-hour storage battery. The air-cooled transformers for the rotaries are three to six phase. The rotaries are all started from the alternating-current side, one-third and two-thirds voltage taps being made on the secondary side of the transformers, thus doing away with synchronizing and making the cutting in of machines a quick and simple task. The storage battery was built by the Electric Storage Battery Company and consists of 588 type G-77 cells. All other apparatus is of General Electric make.

The alternating-current feeders are all equipped with overload relays, which are set to trip the oil switches at about 5,000 kilowatts. The alternating-current rotary panels are also equipped with overload relays, set to trip at about 3,000 kilowatts. The overload breaker on the direct-current rotary panel is equipped with an auxiliary coil, which serves as a low-voltage release, and also, by means of an electrical connection with a speed limit device on the rotary shaft, serves to cut the rotary out on the direct-current side in case an excessive speed is reached. These speed limits are set to trip at about 10 per cent increase above normal speed.

Th "South Broadway" substation is located at 4041 South Broadway. This station consists of four 1,000-kilowatt 600-volt six-phase rotaries and one 600-kilowatt 600-volt six-phase rotary. The auxiliary equipment is practically identical with that just described. All apparatus in this station is of General Electric make.

The "Spring Avenue" substation is located at Spring avenue and North Market street. This station contains four 1,000-kilowatt 600-volt six-phase rotaries, with room for two additional rotaries of the same capacity. It also has in connection a battery room, together with space for the necessary apparatus, such as a booster, etc.

This is the last station we have erected, having been in operation only about five months, and so far as our present experience is concerned, seems to give us the best layout for a combination rotary and battery station. The transformers are placed on a balcony. This enables us to transfer the air chamber and high-tension bus compartments from the basement to the first floor, leaving the basement to be used entirely for battery purposes. All the apparatus in this station is of General Electric make, the auxiliary apparatus being practically the same as before described. This station is built in connection with a trouble station, above which are living apartments for the station operators.

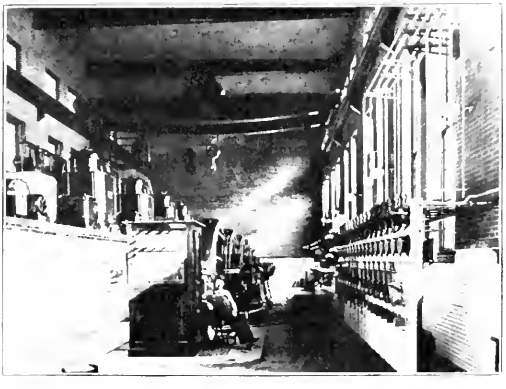
The "Delmar" substation is located at Delmar and Debaliviere avennes. This station contains four 600-kilowatt 600-volt three-phase rotaries and one 500-kilowatt 600-volt six-phase rotary, there being three single-phase transformers for each rotary. This was the first railway substation built in the city of St. Louis and was built entirely after General Electric methods. However, the layout of the station has been almost entirely changed since its installation, owing to changes in intercollecting alternating-current lines, and also to take advantage of improvements that have been made from time to time as regards apparatus and arrangement. The auxiliary apparatus in this station is also practically the same as has been previously described.

In St. Louis county we have three small substations, namely, Brentwood substation, containing two 600-kilowatt rotaries; Creve Coeur Lake substation, which is situated on the bank of the lake of this name, containing two 500-kilowatt rotaries; and Ramona substation, located near the lake of this name, containing two 300-kilowatt rotaries.

Portable Substation.

For several years we have found it inconvenient to handle the traffic on some of the long lines at infrequent intervals. This difficulty we formerly attempted to get around by boosting the direct current; but as this is a very inefficient method and is always attended with some difficulty, we concluded to build a portable substation, in order that it might be located at the center of these loads when needed, thereby enabling us to maintain a good voltage and operate the cars on schedule time.

This substation contains one 600-kilowatt 600-volt three-phase rotary, three single-phase transformers, together with



United Railways of St. Louis—Spring Avenue Substation.

the necessary auxiliary apparatus. The voltmeters and ammeters are so mounted that they can be easily disconnected and packed in a box of waste, which is kept in the car for this purpose. This was done because it was found that in jolting the car over special work the instruments were very liable to get out of order.

This station consists of two cars, the car containing the rotary being equipped with four 50-horsepower motors, and the transformer car being hauled by this motor car as a trailer. Both cars are equipped with air brakes, and on account of the weight carried are built exceptionally strong and substantial, having steel framing throughout.

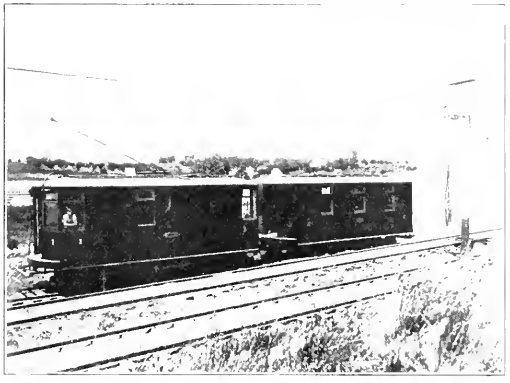
This station has given excellent results. For instance,

one section on which we have experienced considerable trouble is the section extending south from the city limits to Jefferson barracks, a United States military post. Only once each year is there a heavy load on this section, this occurring on Decoration day, when the G. A. R. and other kindred organizations of the city visit the National cemetery, which is located at the barracks. No matter what arrangement of direct-current boosting we have tried, we have always, before the day was over, gotten into some kind of trouble. The result was a pile-up of cars on this section, which we found ourselves unable to take care of. Last year, however, being the first time we used this portable station, cars were run at 1-minute intervals and were operated on schedule time throughout the entire day.

Another location at which this station is used is on the Meramec Highlands line, Meramec Highlands being a pleasure resort situated on the Meramec river, a considerable distance from any power station or substation, and hence its load was hard to handle properly. This load occurs only on Sunday afternoons during the summer season and it was not thought practicable to build a permanent station. The portable station is run out on this line every Sunday morning during the summer, started at about 1 p. m., and run throughout the afternoon and evening, and since this has been done absolutely no trouble has been experienced on account of weak power.

Trolley Feeders for Alternating-Current Transmission.

I might also add that the operation of this portable substation, contrary to what you would probably expect, requires no extra copper in the way of transmission line. The trolley



United Railways of St. Louis—Portable Substation in Two Cars.

taps are taken off a part of the direct-current feeders, which are mounted on high-tension insulators. They are used as alternating-current feeders when the station is operating and by a system of switches in the originating station used on the direct-current bus when the portable station is not in service.

It might be mentioned also that we recently found a use for this portable station which we did not anticipate when building it. Some six weeks ago we had a bad short-circuit on a field in one of the direct-current generators at Hodiamont station. The direct-current end of this station being heavily overloaded on the peak, it was almost imperative that some relief be obtained. The portable substation was stored in a car shed, some two miles from the power station, and had not been used for six months. However, it was ordered to the scene, and with the aid of the line department some taps were made on adjacent high-tension feeders, and in less than two hours the 600-kilowatt substation was standing in the street in front of the power house doing the work of an 800-kilowatt direct-current generator.

Distributing System.

The entire distributing system is divided into feeder sections, each station having a separate panel on the switchboard. A very careful record is kept of the sections, so that the operator in each station knows exactly what sections he is pulling and what section to pull out in case of fire or other trouble. These records are kept in blueprint form, so that any changes made by the wire department can be promptly noted and a corrected sheet inserted in the file.

The alternating-current distributing system, while perhaps not out of the ordinary, is somewhat unusually but advantageously arranged, to afford flexibility of operation between generating and substations. It is possible, by the proper manipulation of switches and the proper sectionalizing of the alternating-current busbars in the different substations to supply power to any of our substations (with the exception of South Broadway) from any one of three generating stations. Also, owing to the construction of the alternating-current busbars in the different substations (sectionalizing switches being inserted in the bus between each rotary), it is possible to operate one substation from either one, two or three generating stations at the same time. This flexibility of operation has frequently proven itself very convenient, especially when it is taken into consideration that we purchase a considerable portion of our power from the Union Electric Light & Power Company, and under the terms of this contract cannot exceed a certain maximum demand of 1,139 amperes at 6,600 volts, or 13,000 kilowatts. Inasmuch as the peaks on the downtown stations do not occur at the same time as those in the outlying stations, we are enabled to materially ease off the peak that must be handled by our own generating stations and at the same time not exceed the critical peak on the Union Electric Light & Power Company's station.

All of our underground alternating-current feeders are triple conductor No. 0000 lead-covered cable, tested to 20,000 volts pressure. Cables are guaranteed to transmit 2,400 kilowatts continuously at unity power factor. On one occasion, however, when we had two cables out of commission on account of electrolysis, one of these cables carried 5,000 kilowatts during the evening peak. This feeder is known as No. 30, and I think the switchboard panel is still decorated with the blue ribbon which the boys put on after the cable had given this efficient service.

Electrolysis.

Although at one time we did have considerable trouble from electrolysis, since the proper precautions were taken we have not had any trouble at all. This electrolytic action is caused by some of the return current leaking from rails to cable along the line where cable run parallels or crosses a car line, and then leaking off the cables onto the rails near the substation. To prevent this latter leakage we have installed a negative or ground wire in a vacant duct in the cable run. This wire is connected to the negative bus at the station and to the lead sheath of cable at each manhole, and runs out far enough to carry the leakage current off the cables. In order to keep in touch with the situation an electrolytic survey is made about every six weeks or two months. Readings of the potential between cable sheath and rails are taken at each manhole, and the result of the survey is then plotted in the form of a curve.

Performance of Equipment.

The following data on performance may be found of particular interest:

Coal.—Screenings, which is usually nut, pea and slack, runs about 30 per cent fixed carbon—about 7,500 British thermal units per pound of coal. Mine run coal runs 40 to 42 per cent fixed carbon, and approximates 10,000 British thermal units per pound of coal.

Coal burned approximately as follows:

Central power station .....15,000 tons per month
Northern power station .....10,000 tons per month
Hodiamont power station ..... 9,000 tons per month

Pounds of coal per kilowatt-hour are from 6½ to 9. Cost to put coal on Green chain grates approximately 15 cents per ton. Ratio of grate to heating surface, 90 to 4,000 = 44.

Battery Boosters.—No regulator used. Straight shunt field connected from station bus. Differential rheostat in series with field; permits field to be built up in either direction for charging or discharging.

Advantage of Six-Phase Rotaries.—Better distribution of winding, enabling size of rotary to be cut down. Voltage between phases on three-phase rotary, 380. Voltage between phases on six-phase rotary, 430.

Batteries.—Watt-hour efficiency of batteries alone: Battery "A," 69.9 per cent; battery "B," 65.8 per cent.

Watt-hour efficiency of batteries and boosters: Battery "A," 66.4 per cent; battery "B," 62.7 per cent.

Battery discharged about 20 points, running between 1,160 to 1,180 low reading; running between 1,180 to 1,200 high reading.

Power.—Used and generated, 3.66 kilowatt-hours per car-mile.

Total kilowatt-hours used in year.....141,566,170
Total kilowatt-hours bought in year..... 42,552,088

Total kilowatt-hours generated in year..... 99,014,082

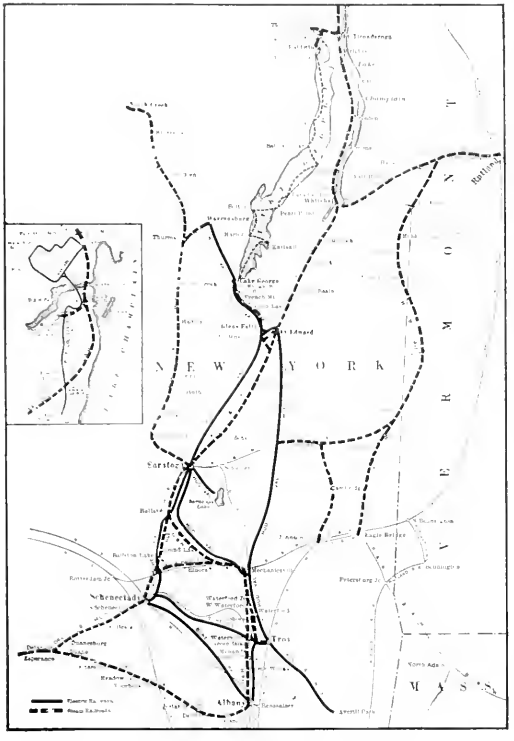
Substation.—Rotary efficiency, full load, 95 per cent; transformer efficiency, full load, 97 per cent; efficiency of substation and battery, exclusive of transmission, 83 per cent.

ELECTRIC RAILWAYS OF THE DELAWARE & HUDSON COMPANY.

In the report for 1907 of the Delaware & Hudson Company maps and charts are published relating to the electric railways owned by the company. The accompanying map shows the electric and steam railways of the company in Albany and vicinity and Plattsburg and vicinity. The following statement is made in the report regarding the electric lines:

The electric lines furnish a complement to the service provided by the steam railroads; and the full benefit of this is derived when the running schedules of the electric roads are made to conform to those of the steam roads so as to afford the best service possible for the patrons of the respective companies.

The construction of trolley lines, even where paralleling the steam railroads, may materially increase the traffic on the



Delaware & Hudson—Railways in Albany and Vicinity.

latter. The steam railroads cannot afford to make the frequent stops which are made by the electric lines, and the traffic is mainly new business created by the increased transportation facilities afforded.

In acquiring electric railways this company has followed the example set by other railroad companies; the advantages accruing through the acquisition of the United Traction Company of Albany, the Hudson Valley Railway (owned by the United Traction Company), the Troy & New England Railway, the Plattsburg Traction Company, and a half interest in the Schenectady Railway [the other interest in which is owned by the Mohawk Valley Company on behalf of the New York Central & Hudson River], can best be understood by a study of the accompanying map, showing the relations between these electric lines and the steam railroads controlled by the Delaware & Hudson.

The net income of all of the electric companies controlled by the Delaware & Hudson is equivalent to a little over 4 per cent on their cost to the Delaware & Hudson. The properties may, therefore, be expected to carry themselves, and pay the interest on the investments.

Although the return to the United Traction Company is equivalent to 3 per cent on the total investment in the securities of the Hudson Valley Railway, it is believed that the results can be materially improved. A considerable amount of betterment work on this line is now under way—additions to the feeder system, additional units at substations, etc.

The Troy & New England Railway owns a valuable franchise in the event that it should, at any time, be deemed desirable to build a connecting line between the Delaware & Hudson tracks and the New York New Haven & Hartford Railroad.

The electric roads operate the following miles of track: United Traction Company, 86; Hudson Valley Railway, 119; Schenectady Railway, 122; Troy & New England Railway, 10; Plattsburg Traction Company, 8.

Other information in relation to individual companies follows:

United Traction Company, Albany, N. Y.—All the franchises are practically perpetual except that of the Capitol Railway, which is for 50 years and expires in 1951. As the tendency of present legislative enactments is to limit the life of franchises, those now owned by the United Traction Company ought to have a constanty increasing value proportionate with the increase in population and the extension of the municipal boundaries.

Hudson Valley Railway, Glens Falls, N. Y.—Each of the constituent companies has practically perpetual franchises, containing the usual clauses and differing only in details, such as paving of streets and local grants. The companies have the right to transport freight, express and mail. While some of the franchises do not state this right, the courts have held such right permissible when not specifically stated to the contrary.

Schenectady (N. Y.) Railway.—A contract was entered into on August 1, 1904, by the Delaware & Hudson Company, the New York Central & Hudson River Railroad and the General Electric Company, whereby the capital stock of the Schenectady Railway was sold and transferred in equal divisions to the two steam railroads, and the General Electric Company guaranteed to the Delaware & Hudson Company, the New York Central Company and the Schenectady Railway the performance of the condition of the agreement by the Schenectady Illuminating Company and the Mohawk Gas Company. The original routes of the Schenectady Railway Company were limited to certain streets in Schenectady. By amendments to its certificate of organization, additional routes were described from Schenectady to Albany, Troy, Saratoga Springs via Ballston Spa, and a route from Green Island bridge through Troy and to other points in Rensselaer county. Certificates of extension were filled by the railway in 1886 and in 1887 to include an extension across the old Mohawk river bridge to Scotia and to Reeseville. Since 1895 a number of certificates of extension have been filed. In 1890 and in 1891 approval was obtained for the use of electricity and all municipal consents obtained subsequent thereto approved and permitted the use of electric power.

Plattsburg (N. Y.) Traction Company.—The village franchise was passed on February 26, 1896, for a period of 50 years from November 20, 1895. The franchise grants rights in the principal streets and has the usual clauses regarding paving between tracks and two feet either side. There is a clause providing that when Plattsburg reaches 20,000 population a percentage of the gross receipts, not to exceed 3 per cent, shall be paid to the trustee of the town.

Comparative Earnings in 1907.

The Commercial and Financial Chronicle of New York gives statistics of earnings for 194 electric railways during 1907. The aggregate gross earnings were $235,718,432, as compared with $212,442,906 for the twelve months of 1906. Aggregate net earnings were $100,526,762, as compared with $94,778,321. The increase in gross earnings was 10.95 per cent and in net earnings 6.06 per cent. The gross earnings of 31 additional roads are also given. The gross earnings of 225 roads were $279,023,468 in 1907, as compared with $254,725,954 in 1906, an increase of 9.54 per cent. There are added to the totals for the calendar year 1907 the results of railways reporting for the fiscal years ended June 30 or September 30, making the total gross earnings of 355 roads $306,266,315, as compared with $280,139,041 in the previous fiscal years, an increase of 9.33 per cent. The net earnings of these roads were $126,002,304, as compared with $121,150,703, an increase of 4.09 per cent.

PAY-AS-YOU-ENTER CARS IN NEWARK—PRELIMINARY EDUCATIONAL CAMPAIGN.

The Public Service Railway Company of New Jersey on April 15 put into operation on its Clinton and Broad lines in Newark 50 pay-as-you-enter cars. Later 100 more similar cars will be put in service. Before installing this type of car a campaign of publicity was carried out with a view to affording the public knowledge of the new operating features. The general co-operation of the passengers in having exact fares ready upon the first day was a result.

A detailed description of these cars appeared in the Electric Railway Review for February 15, 1907. There are, however, some operating features that were not decided upon at that time. One of these is the "fare receiver" shown in the accompanying engraving. It is designed somewhat differently from any now in use. The device is made by The J. G. Brill Company and consists of a rectangular wooden box approximately 3 feet 6 inches in height, in the bottom of which is located a money drawer divided into four separate compartments. On the side of the box nearest to the bulkhead is a semi-circular guide for deflecting the fares into any compartment desired. Before leaving the car at the end of a run the conductor sets the guide for the compartment next to the one he has filled. This arrangement permits of a separate and accurate account of the exact fares accepted by each conductor. The top of the box is of glass, not unlike the fare boxes used on the International Railway at Buffalo. It is designed so that before the coin or ticket is "chopped in" it rests in plain sight of the conductor, allowing an inspection to detect bogus coins or tickets.

Pay-As-You-Enter Car in Newark—View of Rear Platform, Showing Position of Fare Box.

Both cash and ticket fares will be received in the fare box, and to encourage the use of tickets the company has placed them for sale with a number of business houses along the lines of travel at a rate of 20 for $1.00 or 106 for $5.00. Transfers are to be handed unfolded to the conductor.

On the day before the cars were put into service an attractive folder, descriptive of the operation of the cars, was distributed to the passengers on the cars of the Broad and Clinton lines and to each residence along these lines. In addition to the circulars and advertisements in the papers, Newton W. Bolen, superintendent of transportation, accompanied the press representatives on a trip of inspection on Tuesday afternoon, April 15, as a result of which several articles appeared in the morning and afternoon papers.

In connection with the operation of the new cars the motormen and conductors have been very thoroughly instructed. After one week of instruction and demonstration lists of 11 questions for the motormen and 34 for the conductors were asked. By pursuing this method of examination it was found just what details required further demonstration.

The following extracts from the lists of questions for the examination of motomen and conductors should be of considerable interest to officials who contemplate putting this type of equipment into service:

Questions for Conductors.

When it becomes necessary for the conductor to leave car how will he proceed?

What is the rule in regard to leaving car alone at any time?

Would you allow a transfer to be deposited in the fare receiver? How proceed?

In case a counterfeit coin or bogus ticket is deposited in the box how would you proceed?

Will the reporting of transfers be the same as at present?

In the event of a passenger boarding car without the correct change how proceed?

Is it necessary for a conductor to watch the money and tickets deposited closely?

Is it necessary to trip the box for every fare collected?

Are transfers issued the same as at present?

Passengers riding to end of line and wishing to return, how proceed?

Are passengers allowed to remain on the rear platforms?

Is it necessary to examine car, especially push buttons and signal bells, before leaving car house?

How many bells give motorman to come to rear platform case conductor is compelled to leave car?

How proceed in case you run short of change?

How would you proceed relative to witnesses in case of accident?

Would you request passengers to have exact fare ready and transfer unfolded as they enter car?

If passenger should enter car without depositing fare how proceed?

How would you keep a record of 3-cent fares deposited?

If trolley should leave wire would you replace same while passengers were depositing fares?

Where would you deposit transfer envelopes?

Would it be necessary to signal motorman by a signal bell if passengers had already rung electric bell?

Questions for Motormen.

Would you open front exist door before car had come to a full stop?

Would you allow any person to enter car through exit door?

Under what conditions would it be necessary for you to call out "Front way out"?

Between what points are you allowed to use stools?

In case it becomes necessary for conductor to leave car how proceed?

When you receive four bells from conductor what does it mean?

Improved Frequency Converter.

A patent has been issued for a frequency converter consisting of two rotary converters mounted on the same spindle. The current to be converted is sent into the slip rings of one of the machines and the direct current produced is then sent into the commutator of the second machine (having a different number of poles), which finally delivers the alternating current of altered frequency. Both machines can be compounded by the direct current produced. Such a converter requires no separate exciter, as does the more ordinary arrangement consisting of a synchronous motor driving an ordinary alternator. Further, the armature reaction and heating are low in both machines, owing to the partial neutralization of the direct and alternating currents, as in the case of the ordinary rotary converter.—The Electrical Engineer, London.

IMPROVED THIRD-RAIL SLEET BRUSH.

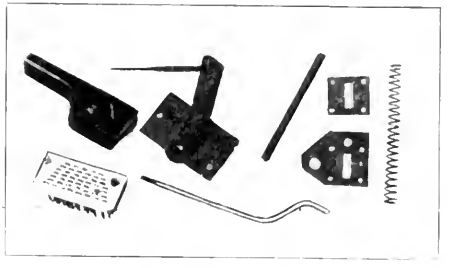
BY F. J. STEVENS, MASTER MECHANIC.

The Lackawanna & Wyoming Valley Railroad Company is using a new sleet equipment which lately has given very satisfactory service. This road operates 20 miles of double track between Scranton and Wilkesbarre, Pa., using an unprotected top contact third rail. During the four years in which the road has been in operation several methods have been tried for keeping the third rail clear during snow and sleet storms. The sleet is the more difficult condition to overcome. It is well known that calcium chloride will overcome the sleet difficulty, but to deliver it at the proper time and place has been a knotty problem.

An essential part of the present device is a stiff steel brush 2¾ by 6 by 3½ inches in size, with a wooden back ⅞ by 3⅝ by 8 inches in size is suspended diagonal to the third rail. This width of brush has been found sufficient to meet the requirements and its position with relation to the third rail allows for the lateral movement of the truck. The brush is bolted to a piece of iron ⅜ by 5 by 8 inches, which is riveted to the support or carrying iron. The iron back is drilled and tapped so that a ¼-inch pipe may carry the chloride solution to the brush. The brush support is made of 2 by ½ inch iron One end extends up through the third rail beam and an adjusting handle; the other outward over the brush. The end extending through the beam is the one which is used to adjust and care for the wear of the brush. A row of holes is bored one inch apart near each edge of this iron, the holes on one edge being started ½ inch above the other edge. This allows for lowering the brush ½ inch at a time, which amount has been found sufficient to compensate for the wear. It is through one of these holes that the adjusting handle is bolted to the brush iron. The handle is arranged so that when the brush is raised the handle is in a perpendicular position, as may be noted in an illustration.

On the top and bottom of the shoe beam are secured two flat pieces of ¼-inch iron, in which holes 1⅝ by 2⅛ inches have been cut to allow the angle iron to pass through and to act as a guide. In the part of the angle iron extending over the brush a hole is drilled and tapped for a ½-inch pipe. This pipe extends through the ¼-inch piece of iron secured to the top of the beam. Against this iron, where it extends past the face of the beam, is a coil spring serving to press the brush against the rail. When the brush is new it has a pressure on the third rail of 38 pounds and when worn down 1½ inches it has a pressure of 28 pounds. Care should be taken that the spring is not so strong that it will bend the brush.

Sixty-quart milk cans are utilized for the storage of the calcium chloride. These tanks are carried in the front vestibule of a car. On one side of the can near the bottom a hole is made to allow for a short nipple, which is securely bossed in place. A tee is put on this nipple with fittings for ⅜-inch gate valves, the outside of the valves being bushed for ¼-inch pipe. Over this pipe is slipped a piece of ½-inch rubber tubing. The tubing is then passed through a hole in the trap door and to a piece of ¼-inch pipe fastened by two hangers under and near the edge of the car. The use of pipe is necessary because a hose long enough to reach from the calcium chloride tank to the brush would be in danger of being torn off by the swinging of the truck. Another piece of tubing is used to carry the choride from this pipe to the pipe leading through the wooden back of the brush. In this way the brush

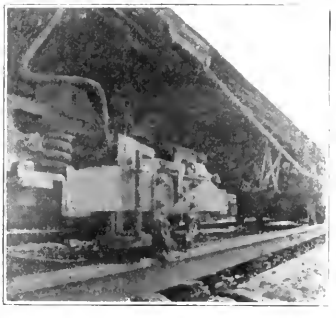


Sleet Brush—Parts.

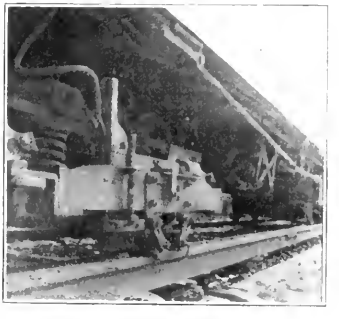
serves two purposes: (1) That of scraping the rail and (2) preventing the chloride from being blown away, as would be likely with a car running at a high rate of speed.

A brush is carried on each beam, but the head ones only are piped for the chloride. All parts are made from templets and are interchangeable. The adjusting handle is made of wood and with proper care can be used without danger of receiving shocks. A worn-out brush can be removed and replaced in less than five minutes. These brushes as now constructed wear remarkably well and seldom have to be replaced.

Sleet Brush—Chloride Cans.



Sleet Brush—Lowered.



Sleet Brush—Raised.

Handling Ashes in Philadelphia.

The Philadelphia Rapid Transit Company has made a contract for hauling ashes and street dirt at night from the central district of the city to the dumping grounds and has constructed eight special ash cars for the purpose. The city ash contractors have erected a large central dumping station, to which the ashes and dirt are brought by wagons. An inclined wagon road leads from the street level to a platform on the inside of the building, from which the wagon loads are emptied into the ash cars. The station is so constructed that four cars of 21 tons capacity each may be loaded in it at one time.

News of the Week

Iowa Street and Interurban Railway Association Programme.

The fifth annual convention of the Iowa Street and Interurban Railway Association will be held at the Savery hotel, Des Moines, Ia., Thursday and Friday, April 23 and 24. The following papers will be read:

"Reinforced Concrete in Electric Railway Construction," N. M. Stark, Des Moines.

"Depreciation," Daniel Royse, Chicago.

"Claims—Handling by Electric Railways," Arthur W. Gross, Omaha.

"Advertising by Electric Railways," general discussion.

"Handling Fares on Interurban Railways," P. P. Crafts, Cliuton.

"Interstate Commerce Commission—Statistics and Accounts," C. L. Wight.

L. D. Mathes, general manager Union Electric Company, Dubuque, Ia., is secretary and treasurer of the association.

Transit Affairs in New York.

The New York public service commission of the first district took action on April 10 which may result in a material change in the plans for the subway loop between the Williamsburg and Brooklyn bridges. The chief engineer was directed to report on the most desirable route for an extension of the Manhattan loop under the East river to Brooklyn, instead of connecting with the Brooklyn bridge at Park Row as at present planned. The chief engineer was also directed to prepare detailed plans for a continuation of the loop through Broadway in Brooklyn in order to connect the bridges on that side. The Manhattan loop connecting the Williamsburg and Brooklyn bridges via Delancey and Centre streets is now under construction, the idea being to run the Brooklyn Rapid Transit Company's elevated trains, which now cross the bridge, through the loop. It is recognized that this route could hardly be successfully operated by any other company, but the Brooklyn Rapid Transit Company has not as yet expressed any desire to bid for the route. By building the Brooklyn portion of the bridge loop it is believed that it could be made independent of the Brooklyn Rapid Transit Company and also divert a portion of the bridge traffic.

On the same day Comptroller Metz sent a communication to the board of estimate advocating the construction of the Brooklyn portion of the bridge loop before beginning work on the Broadway-Lafayette or Fourth avenue lines, in order to have a complete loop which might be operated by an independent bidder in case the Brooklyn Rapid Transit Company failed to snbmit a bid. Mr. Metz snggested that such a line could be successfully operated for short-haul traffic at a 3-cent fare.

Thomas F. Ryan was called as a witness on April 8 and 9 in a suit brought by two stockholders against the directors of the Metropolitan Street Railway to recover damages for losses alleged to have been snstained through misleading reports issued by the company for the years 1905 and 1906. Mr. Ryan occupied the stand for the greater part of the two days and testified in regard to many of the details of the financial history of the New York street railway companies.

The appellate division of the supreme court of New York on April 10 rendered a decision reversing the decision of a lower court and granting a new trial in the suit of the public service commission to restrain the Interborough Rapid Transit Company from selling electricity.

For some time the New York City Interborough Railway Company has obtained its current from the Interborough Rapid Transit Company through the subway ducts. The question came up as to whether the latter company, under its lease of the subway, could use the ducts for transmitting electricity to be sold to others. The old rapid transit commission, of which the public service commission is the successor, brought suit to restrain the Interborough Rapid Transit Company from furnishing and the New York Interborough Railway Company from receiving and using electrical current transmitted through the ducts in question, and asked for an accounting for the reasonable value of such current previously furnished and used. A decision was rendered in favor of the plaintiff in May, 1907. The lower court held that the company's lease gave it the right to operate for traffic purposes only. It is stated that the commission will appeal to the court of appeals.

The Interborough Rapid Transit Company informed the commission on April 11 that a contract had been let to the Rapid Transit Subway Construction Company for the reconstruction of the tracks in the subway between Ninety-sixth and One Hundred and Third streets, which will relieve much of the congestion caused at present by the crossing of the local and the express tracks. It is proposed to construct new tracks on each side of the present tracks and the Lenox avenue tracks will be carried directly under the Broadway tracks at One Hundredth street.

Fail to Reach Agreement in Cleveland.

Negotiations between Mayor Johnson and F. H. Goff in the attempt to agree on the valuation of the Cleveland Electric Railway, which were broken off last Tuesday when Mr. Goff refused to accept the valuation of $50 a share offered by the mayor, were resumed on Saturday, April 11. At the suggestion of Mr. Goff a meeting of the city council was held on Saturday morning, after the Cleveland Electric directors had extended temporarily his power to act for the company.

At the meeting the mayor stated that the only feature of the settlement remaining to be decided was the question of price, all details of the security franchise and the lease to the Municipal Traction Company having been settled. He then repeated his offer of $50 a share for the Cleveland Electric stock. Mr. Goff then submitted a table showing the differences between his estimate and the mayor's, which amounted to $22.12, making a total of $72.12 per share, and offered to compromise at $60 a share. Mayor Johnson declined to increase his offer and suggested that the matter be discussed by the council.

A public meeting was held on Monday and the councilmen and public were given an opportunity to discuss the subject. Many members of the council advocated a provision for seven tickets for 25 cents in the security franchise and opinion seemed about evenly divided as to whether the mayor should compromise on the valuation. Another meeting was held on Tuesday without changing the situation.

At the regular meeting of the city council on Monday night the Forest City Railway applied for franchises covering several of the most important streets now occupied by the Cleveland Electric Railway, whose franchises expired on that day, according to the city's claim. The application included the Woodland, Lorain, West Madison and Detroit avenue lines, with several feeder lines, comprising an important part of the system.

Legislation Affecting Electric Railways.

New York.—The Robinson bill, which authorizes the public service commission to award indeterminate franchises for the construction and operation of rapid transit rontes to private corporations, reserving the right of the city to purchase the property after 50 years, has been reported to the assembly with an amendment.—Senator Travis' constitutional amendment exempting bonds for self-sustaining enterprises from consideration in calculating the debt limit of the city of New York has been passed by the senate. A similar bill has been introduced in the assembly, urged by the Citizens' Union to meet the objection that the bill might allow a franchise to become permanent. This amendment provides that the city may sell the property to another company at the end of 50 years in case it does not desire to acquire the road itself. The bill also increases the term for which a subway built by the city may be leased to an operating company to 35 years.

Ohio.—Governor Harris on April 15 signed the Schmidt bill, which was passed by the house last week. The bill provides that franchises on streets occupied by street railways may be granted to new companies or renewed upon the expiration of the original franchises without the necessity of securing new consents of property owners. As amended by the house the bill provides that the action of city councils on franchises shall be referred to a referendum vote upon application of 15 per cent of the qualified voters, and must be approved by a majority of the voters to become effective. Another amendment requires the consents of property owners for an extension of tracks.—A bill introdnced by Representative Stockwell, giving municipal councils authority to grant 2-year franchises for street railways without requiring competitive bids for the grants or the consents of property owners was tabled by the house on April 14, with the understanding that it will not be reconsidered.

American Institute of Electrical Engineers.—At the next meeting of the Cincinnati section, to be held at the University of Cincinnati, Sebastian Senstius, Triumph Electric Company, will present a lecture on "The Testing of Induction Motors."

Strike in Pensacola.—The street railway service of the Pensacola (Fla.) Electric Company has been tied up since April 6 by a strike of the motormen and conductors, caused by a controversy as to working conditions. The company has refused to deal with the union as a body and has imported strikebreakers to operate its cars. Several riots have occurred and on April 13 the state militia was called upon to

assist the police in enforcing order. On April 11 cars were operated over two of the company's lines with little disturbance from the strikers or their sympathizers. No attempt has been made to operate cars at night.

Engineering Experiences.—At a meeting of the Worcester branch of the American Institute of Electrical Engineers on April 17 K. C. Randall, engineer Westinghouse Electric & Manufacturing Company, presented an address entitled "Notes on Engineering Experiences."

American Institute of Electrical Engineers, Pittsfield Section.—At the tenth meeting of the season, held on April 10, W. S. Moody, chief engineer transformer department General Electric Company, presented a paper on "Feeder Regulations." He reviewed the subject exhaustively, both from the historical and engineering aspects.

Bloomington Franchises Attacked.—The city attorney of Bloomington, Ill., has filed a suit against the Bloomington & Normal Railway & Light Company to test the validity of its franchises. The city claims that practically all of the company's franchises in Bloomington have either expired or were illegally granted to the company's predecessor, the Bloomington & Normal Horse Railway, while the company claims that it has a perpetual franchise covering a large portion of its trackage.

Plans for Chicago Subway to be Considered.—Mayor Busse of Chicago has announced that he will send a special message to the city council on April 27 urging that preliminary work be taken up at once on the plans for a subway loop for the downtown district. It is proposed to make a thorough investigation before the method of construction or the route is decided upon, and the mayor will recommend that the entire subject be referred to the local transportation committee, which may engage the services of engineering experts as they are required. The franchise ordinances of the Chicago City Railway and the Chicago Railways companies require them to contribute an amount not to exceed $5,000,000 toward the cost of a subway. Several members of the council have expressed themselves in favor of devoting the city's share of the companies' net receipts, which now amounts to about $1,500,000 a year, to a subway construction fund. The ordinances provide that the plans for a subway shall be authorized by the city council and approved by the board of supervising engineers.

Superintendent of Public Utilities for Seattle.—The city of Seattle, Wash., has recently created the office of superintendent of public utilities and Alfred V. Bouillon has been appointed to the position. The superintendent of public utilities is appointed by the mayor, with the approval of the city council, and receives a salary of $300 a month. His term of office expires December 31, 1909. He is to have supervision over all franchise public service companies in their relations with the city and is to act as the official adviser of the city in all matters pertaining to franchises. All applications for franchises will be referred to him and his recommendations will be presented to the city council. He is required to see that the provisions of all franchise ordinances are properly enforced and to present to the board of public works, of which he is an ex-officio member, recommendations from time to time as to such changes or betterments in the equipment of public service companies as may be required to insure the safety and comfort of the public. Mr. Bouillon has had an extended experience as a civil and mechanical engineer.

Strike in Chester, Pa.—The motormen and conductors of the Chester (Pa.) Traction Company declared a strike on April 12 because of a reduction of wages and working hours, which took effect on April 1. On that date the Interstate Railways Company of Philadelphia, which controls a large number of electric railways in Pennsylvania, reduced the wages of the carmen employed on its lines from $18\frac{1}{2}$ to $16\frac{2}{3}$ cents per hour. The service has also been reduced. A branch of the union was organized and on April 12 the men voted to strike. At a conference with President John A. Rigg and General Superintendent A. G. Jack on April 13 representatives of the strikers demanded a resumption of the former wage scale and recognition of the union. President Rigg said that the company had suffered greatly by the business depression and that while he hoped the reduction would be only temporary, the company could not afford to restore the old rate. An attempt to operate cars with strikebreakers on Monday led to a serious riot and a detachment of state militia was called. As the presence of the militia served only to increase the violence of the mob they were withdrawn from the city and the situation was left in the hands of the police. On Monday night several switches were torn up. On Tuesday 100 special deputies were sworn in to assist the police in restoring order. On Wednesday two employes of the company were shot in a conflict with the strikers.

Traffic and Transportation

Massachusetts Commission Upholds 6-Cent Fare.

Upon the petition of residents of Stoughton, Mass., protesting against the increase in fare from five to six cents by the Blue Hill Street Railway between Stoughton square and Canton crossing, the Massachusetts railroad commission has investigated the earnings of the company and concludes that the 6-cent fare is reasonable. The commission says:

"An analysis of the company's earnings for the last four years discloses an operating loss of between $6,000 and $7,000 in 1904, 1905 and 1907, respectively, and a gain of $1,000 in 1906. These totals, respectively, added to and substracted from the previous deficit of the company in connection with sundry entries of profit and loss, mainly damage claims covering the periods 1906-1907, show the total deficit for the year ending September 30, 1907, as $55,622.07.

"These figures convince the board that the company is unable to profitably operate for a 5-cent fare over its established fare limits, and must of necessity advance the charge.

"The primary question presented is whether the advance to six cents as a unit of fare is unreasonable. The 6-cent fare went into effect January 5, 1908. The company, at the request of the commission, has furnished a statement of the comparative gross receipts to April 5, 1908, and for a corresponding period in 1907. The comparative statement is as follows: Gross receipts from January 5 to April 5, 1907, $14,797.24; 1908, $15,520.44; increase, 5 per cent.

"These returns have been carefully analyzed, and we find nothing in them that leads us to the opinion that the income of the company under this increased rate for service is unreasonable."

Transfers Discontinued Between New York Systems.

Transfers between most of the connecting lines of the New York City Railway and the Third Avenue Railroad were abolished at midnight on April 11, in accordance with the order of Judge Lacombe of the United States circuit court. The companies had prepared passengers for the change in the system by notices in the cars, but many people did not understand the situation and considerable confusion resulted. Where passengers refused to pay second fares when their transfers were declined the police were frequently called upon for assistance and some arrests were made.

Edward A. Maher, general manager of the Third Avenue Railroad, said: "We have been coaching the conductors and inspectors for the last week, and we instructed the conductors not to eject persons from the cars if they refused to pay the extra fare for the first day or two. It takes some time for the public to get accustomed to the rule, and, of course, many persons failed to read the notices in the cars or in the newspapers."

In discussing the situation the New York Tribune said: "Every one knows what inconvenience and hardship the change will be to many people, but no one knows whether or not it will be any real advantage to stockholders. Only a few years ago it used to be the fashion to say that the transfers promoted traveling in various ways; for instance, by dispersing the people farther from their working places and causing family and social visits, which would be made infrequently at two fares, but frequently at one, and that the companies profited from it; but now all that is changed, and the system is held up as a prime cause of bankruptcy. * * * Both the dishonest conductor and the dishonest passenger may be eliminated by the new pay-as-you-enter cars. But the companies clearly overreached themselves in their determination to give the public less than it could reasonably demand for its money. The high taxes of which they complain reflect, in part at least, the public irritation. Perhaps those taxes ought to be reduced. Perhaps wiser management will do away with some of the present losses through dishonesty and through damage suits. But it will be a matter of general regret if it be shown that to operate street cars profitably in New York transfers have to be abolished."

Schenectady Railway Discontinues Sale of Tickets Through Conductors.—The Schenectady (N. Y.) Railway has discontinued the sale of tickets through conductors.

Smoking and Dogs Not Allowed.—Under a new rule, which became effective on April 10, 1908, the Omaha & Council Bluffs Street Railway of Omaha, Neb., does not permit smoking on the front platforms of cars or allow dogs to be carried on the cars.

It is stated that the line of the Connecticut Company from Rockville to Stafford Springs, Conn., will be opened next week.

Construction News

FRANCHISES.

Bowling Green, O.—The county commissioners have granted a franchise to the Lake Erie Bowling Green & Napoleon Railway Company to lay its tracks from Bowling Green west to the county line at Grand Rapids, O., this being part of its proposed 7-mile extension from Bowling Green to Tontogany, O.

Colfax, Ia.—Col. James P. Donohue of Davenport, Ia., has asked the city council for a franchise to build a street railway from the Rock Island depot to the Colfax sanitarium in Colfax. The council may call a special election to vote on the application.

Hummelstown, Pa.—The Central Pennsylvania Traction Company, Harrisburg, and the Hummelstown & Campbellstown Street Railway Company, Hershey, Pa., have applied to the borough council for permission to connect their tracks at Rosanna street in Hummelstown.

Los Angeles, Cal.—The mayor has vetoed an ordinance recently passed by the city council granting the Los Angeles Railway a franchise for its line on South Park avenue from Thirtieth street to the city limits, a distance of about two miles. The reason given is that the compensation, $500, is not sufficient. The company has been operating the line under a franchise that has been declared illegal.

Mattoon, Ill.—A franchise has been granted to the Mattoon Shelbyville Pana & Hillsboro Railroad of Charleston, Ill., for the operation of its interurban line in Mattoon.

Oshkosh, Wis.—The Winnebago Traction Company will apply to the city council for a franchise to extend its line from West Algoma street south on Sawyer avenue to connect with the Ninth street line.

Oxnard, Cal.—Application for a street railway franchise in Oxnard has been made by the Bakersfield & Ventura Street Railway Company of Oxnard, Cal. Thomas Blackburn, superintendent.

Perry, N. Y.—The Rochester Scottsville & Caledonia Electric Railroad Company, which is building a 52-mile interurban road from Rochester to Portage Falls, N. Y., has been granted a franchise in Perry, N. Y. D. C. Salyerds of Scottsville, N. Y., is president.

Portland, Ore.—The Portland Railway Light & Power Company will soon make application for a franchise to extend its tracks through the East Side district, where the population has recently greatly increased.

Vancouver, Wash.—The city council has declared forfeited the franchise of the Washington Railway & Power Company, which began the construction of a street railway in Vancouver last summer and suspended work in October.

Walla Walla, Wash.—The county commissioners have granted a franchise to the United Railways Company of Portland, Ore., for the operation of its interurban line along the east side of Walla Walla to the Washington cemetery. Work must be started by January 1, 1909, and the entire line in Oregon be completed by the end of that year.

RECENT INCORPORATIONS.

Canadian Valley Railway.—Incorporated in Oklahoma with a capital stock of $2,000,000 to build an electric railway from Mutual to Oklahoma City, Okla.

Cincinnati Wilmington & Xenia Traction Company.—Incorporated in Ohio with a capital stock of $50,000. K. H. Grantham and others are the incorporators.

Essex Valley Land Company, Hot Springs, Ark.—Incorporated in Arkansas to do a general real estate business and to build an electric railway from Hot Springs to Essex Park and Potash Sulphur, Ark. It is stated that one of the surveyed routes of the proposed Little Rock & Hot Springs Interurban Railway will be used by the new line. Incorporators: J. A. Riggs and W. S. Kirkham.

Exeter Railway & Lighting Company, Exeter, N. H.—Incorporated in New Hampshire as one of two companies into which the Exeter Hampton & Amesbury Street Railway Company has been reorganized. Capital stock, $340,000. The Exeter & Hampton Electric Company is the name of the other company. Capital stock, $100,000.

Indianapolis Cloverdale & Terre Haute Traction Company, Indianapolis, Ind.—Incorporated in Indiana to build an electric railway between Indianapolis and Terre Haute, through the counties of Marion, Morgan, Putnam, Clay and Vigo, and serving the following towns and cities: Indianapolis, West Newton, Mooresville, Gasburg, Monrovia, Hall, Eminence, Cloverdale, Polen, Ashville, Brazil and Terre Haute. Capital stock, $10,000. Incorporators: E. M. Bowman, H. T. Butze and Dennis Rutherford; all of Indianapolis, Ind.

Logansport & South Bend Traction Company.—Incorporated in Indiana to build an electric railway 70 miles long from South Bend to Logansport, Ind. Capital stock, $10,000. Alexander Coquillard of South Bend and others are interested.

South San Joaquin Improvement Company.—Incorporated in California to do a general development business and promote the construction of an interurban railway from Stockton to Manteca, Cal. Incorporators: D. O. Castle, J. A. MacAfee, E. J. Baker, French Camp; E. Powers, J. D. Maxey, Manteca; B. A. Goodwin, C. B. Matthews, Ripon, Cal.

Woodstock & Sycamore Traction Company.—Incorporated in Illinois to build an electric railway from Woodstock, McHenry county, to Sycamore, De Kalk county, Illinois, 38 miles. Capital stock, $1,000,000. Incorporators: Clinton G. Lumley, E. C. Spinney, Irving W. Stephens, E. B. Harang, S. H. Rhodes, William L. Abbott, George W. Lyndon, George T. Goodrow, Henry P. Heiser, N. G. Schmitz and Charles A. Spenny.

TRACK AND ROADWAY.

Atlanta & Carolina Railway, Atlanta, Ga.—Matthew Mason, vice-president, general manager and chief engineer, writes that contracts are to be let about May 15 for the construction of this proposed road from Atlanta to Augusta, Ga., 175 miles, via Lithonia, Conyers, Monroe, Athens, Lexington and Washington. Surveys have been completed and grading is to begin about June 1. Power is to be purchased. Construction has been started on a portion of the proposed city lines in Atlanta. The Georgia railroad commission has authorized a bond issue of $6,000,000. J. W. English is president and M. T. Edgerton secretary.

Biddeford Pool Electric Railway, Biddeford, Me.—Charles W. Moses, president, writes that this company proposes to build an electric railway from Biddeford to Biddeford Pool, a summer resort, 14 miles. Surveys have been completed and construction work is to begin as soon as a contract can be arranged with responsible parties. The company's charter has recently been extended for three years. The route lies through a thickly settled territory whose resources require transportation facilities for their proper development. George E. Getchell, chief engineer, Augusta, Me.

Calgary, Alberta.—The city council desires to receive offers for the construction, equipment and operation of a street railway in the city of Calgary for a limited period of franchise. For particulars apply to H. E. Gillis, city clerk.

Cassville & Western Railway, Cassville, Mo.—L. B. Mitchell, assistant secretary, writes that this steam road, extending from Cassville to Exeter, Mo., five miles, is to be electrified and extended in the near future.

Charleston & Summerville Electric Railway, Charleston, S. C.—A meeting of the stockholders has been called for May 29 for the purpose of increasing the capital stock to $400,000 to complete the interurban line from Charleston to Summerville, S. C., 27 miles. It is also proposed to build a city line in Charleston. A committee of Charleston citizens recently made an investigation and reported in favor of completing the road, on which most of the grading was completed last year. New York capitalists are said to have become interested in the road and it is expected that construction will be resumed at an early date. F. S. Wright of Brooklyn, N. Y., is vice-president, and George Tupper of Charleston is secretary and treasurer. (Noted March 14.)

Columbia & Walla Walla Traction Company, Waitsburg, Wash.—It is stated that this company proposes to begin construction this spring on a portion of its proposed line connecting Dayton, Walla Walla, Waitsburg, Milton and Wallula, Wash. The power house is to be located on the Tocannon river. M. C. Moore of Walla Walla is president and J. T. Bartlett of Waitsburg is chief engineer. (Noted August 24, 1907.)

Coos Bay Gas & Electric Company, Marshfield, Ore.—Seymour H. Bell, treasurer and manager, writes that this company proposes to build a short line of street railway this summer.

Davenport & Manchester Interurban Railway, Davenport, Ia.—George T. Baker, president, writes that surveys are being made for the proposed line from Davenport to Manchester, Ia., via Bennett and Monticello, 93 miles. Officers: A. J.

Voorhees, vice-president; J. F. Halligan, treasurer; F. W. Rank, secretary; W. H. Kimball, chief engineer. (Noted April 11.)

Easton (Pa.) Transit Company.—H. R. Fehr, president, writes that this company will build an extension of the Easton and South Bethlehem line through Washington Heights, 1.4 miles. A contract has been awarded for the construction of a bridge across the Philadelphia & Reading tracks.

Fairmont & Clarksburg Traction Company, Fairmont, W. Va.—This company is reported to have completed a survey for its proposed extension from Grasseli to Bridgeport, W. Va. S. B. Miller, chief engineer.

Fairmont & Mannington Electric Railroad, Fairmont, W. Va.—It is reported that work is to be resumed at once on the construction of the line from Fairmont to Mannington, W. Va., 14 miles. About 3½ miles of track were laid last fall. The Blodget Construction Company of Wheeling, W. Va., has the contract. F. H. Bailey, general manager. (Noted December 21.)

Findlay-Marion Railway & Light Company, Columbus, O.—G. W. Meeker, secretary and treasurer, states that it is proposed to begin active construction on the proposed line from Findlay to Marion, O., 46 miles, about May 1. The overhead trolley system will be used. R. P. Hankey, president, Detroit, Mich. (Noted March 7.)

Ft. Wayne & Springfield Railway, Decatur, Ind.—W. H. Fledderjohann, president, writes that grading is now in progress on the extension from Decatur to Berne, Ind., 12 miles. The work is being done by the company. The overhead construction will be of the catenary type. It is not proposed to build the extension to Springfield, O., this year. A. W. Fishbaugh, chief engineer, Celina, O. (Noted March 14.)

Gainesville Whitesboro & Sherman Railway, Gainesville, Tex.—It is reported that a contract has been let for the construction of this proposed road from Gainesville to Sherman, Tex., 39 miles, to the Tenney Construction Company of Silver City, N. M., and that work is to begin in a few days. John King, vice-president. (Noted March 7.)

Grand Junction, Colo.—It is stated that the Fruit Belt Power & Irrigation Company, recently organized, proposes to build an electric railway from Grand Junction to points in the Grand Valley.

Hanover & McSherrystown Street Railway, Hanover, Pa.—R. E. Mauley, general manager, writes that construction has been started on an extension from McSherrystown, Pa., 5½ miles. John Dobbling of York, Pa., has the contract for grading. The overhead construction is being erected by the railway company. R. B. McKinnon, York, Pa., chief engineer. (Noted January 18.)

Iowa Railroad, Eldora, Ia.—George Welsby Scott, consulting engineer, of Chicago, has just completed an especially favorable report on the project of the Iowa Railroad to build an electric railway from Waterloo to Perry, Ia., via Cedar Falls, Normal, Lincoln, Grundy City, Eldora, Hubbard, Story City and Boone, with a branch from Story City to Ames, a total distance of 127 miles. The proposed line would pass through one of the richest sections of Iowa, capable of originating a large traffic in freight, passengers and express and including several county seats besides three state institutions, the agricultural college at Ames, the industrial school at Eldora and the normal school at Cedar Falls. The estimated tributary population is 375 per mile. Mr. Scott estimates the cost of construction and equipment for 127 miles of line at $3,868,600. The power house is to be located at Eldora. At Ames the line connects with the Ft. Dodge Des Moines & Southern Railroad and it is proposed to secure trackage rights over this line into Des Moines. The Iowa Railroad was incorporated on March 31 under the laws of Iowa, with $100,000 capital stock. The charter includes broad powers to extend the line into any part of the state and to operate other public utilities. It is proposed to build at first only the section from Eldora to Ames. The officers of the company are: President, Henry S. Osborne, Chicago; vice-president and general manager, Andrew Stevenson, Chicago; second vice-president and treasurer, James F. Hardin, Eldora; general counsel, Frederic P. Vose, Chicago; secretary, L. W. Harris, Eldora; assistant secretary and assistant treasurer, Louis A. Bowman, Chicago. The company is now seeking to interest the people along the proposed route in its proposition.

Irwin, Pa.—It is reported that a company has been organized to build an electric railway from Manor to Claridge, Pa., and that a survey of the proposed line is now being made. H. A. Lauffer is president.

Joplin & Pittsburg Railway, Joplin, Mo.—R. W. Harris, general manager, writes that grading has been completed on the line from Joplin, Mo., to Pittsburg, Kan., 26 miles, via Asbury, Waco, Carl Junction and Chitwood. All contracts have been let. A. L. Register & Co. of Philadelphia has the general contract. Substations are under construction at Asbury and Turkey Creek, each of which will be equipped with two 300-kilowatt rotary converters. The overhead construction will be of the catenary type. J. J. Heim of Kansas City is president and Henry Rohwer of St. Louis is chief engineer. (Noted April 4.)

Jersey Central Traction Company, Keyport, N. J.—It is reported that this company expects to build about 4 miles of track, including about 1½ miles of trestle work. George I. Brown, general manager.

Kalamazoo Elkhart & South Bend Traction Company, South Bend, Ind.—It is reported that this company intends to begin construction next month on its proposed line from South Bend, Ind., to Kalamazoo, Mich., by way of Mishawaka, Elkhart and Three Rivers, 73 miles. A. D. Harris, president, and G. M. Morrison, chief engineer. (Noted January 25.)

Kentucky & Ohio River Interurban Railway, Paducah, Ky.—John J. Freundlich, general manager, writes that grading is to be started on May 15 on the proposed line from Paducah, Ky., to Cairo, Ill., 40 miles, via Cecil, Grahamsville, Ingleside, Bandana and Oscar. The Royal Investment Company of Minneapolis, Minn., has the general contract. C. F. Crump of Columbus, Ind., is president, and L. B. Whiteside of Franklin, Ind., is secretary. (Noted April 4.)

Little Rock-Pine Bluff Transit Company, Pine Bluff, Ark.—This company has been organized and will soon be incorporated to build an electric railway from Little Rock to Pine Bluff, Ark., 40 miles. Right of way is now being secured and it is stated that construction will be started at an early date. The officers are: President, W. F. Campbell, Redfield, Ark.; vice-president, B. F. Foreman, Texarkana; secretary and treasurer, Mrs. F. A. Gibson, Redfield, Ark.

Mahoning & Shenango Railway & Light Company, New Castle, O.—President E. N. Sanderson has announced that the Elm street line in Youngstown, O., will be double-tracked this year if permission can be secured from the city council.

Marquette County Gas & Electric Company, Ishpeming, Mich.—We are officially advised that surveys are being made for an extension from Negaunee to Marquette, Mich., 13 miles, but it has not yet been decided when contracts will be let. A. L. Drum & Co., Chicago, represent the company as consulting engineers. W. J. McCorkindall, general manager.

Mattoon Shelbyville Pana & Hillsboro Railroad, Charleston, Ill.—W. R. Patton, president, is quoted as saying that construction is to begin within the next few months on the proposed line from Mattoon to Hillsboro, Ill., 68 miles. As surveyed the line closely parallels the Cleveland Cincinnati Chicago & St. Louis Railway. All of the necessary franchises have been secured. (Noted December 21, 1907.)

Michigan United Railways, Lansing, Mich.—It is stated that construction will be resumed on the line between Lansing and Mason, Mich., within a few days. Four miles of grading were completed last fall. The Northern Construction Company, of which J. J. Martindale is chief engineer, is building the line. (Noted November 9, 1907.)

Minneapolis St. Paul Rochester & Dubuque Electric Traction Company, Minneapolis, Minn.—F. A. Martin, general superintendent, writes that specifications and profiles have been completed for the proposed road from Minneapolis and St. Paul, Minn., to Dubuque, Ia., and contracts are to be let shortly. F. G. L. Hunt, chief engineer. (Noted January 18.)

Montgomery Electrical Company, Christiansburg, Va.—A. A. Phlegar, secretary, states that it is hoped to make financial arrangements for building the proposed road from Christiansburg to Cambria, Va., 2¼ miles, this year. (Noted March 11.)

Montreal & Southern Counties Electric Railway, Montreal, Que.—This company, which proposes to build an electric railway from Montreal to Longueuil, St. Lambert, Chambly Basin, Chambly Canton and Merieville, Que., is stated to have awarded a contract for bridge work to the Dominion Bridge Company. Construction is to be started at once.

Murphysboro Railway Light Heat & Power Company, Murphysboro, Ill.—It is reported that this company proposes to build an extension about two miles long.

Murray, Utah.—The city council has appointed a committee to consider the feasibility of building an electric railway to Garfield.

Ohio Electric Railway, Cincinnati, O.—Morris Hacker, principal assistant engineer, Lima, O., writes that 27 miles

of tracklaying have been completed this year, from Lima to Huntsville, O., on the Lima-Bellefontaine line, which will be 34 miles long, via Waynesfield, New Hampshire, Lakeview and Huntsville. Grading has been completed and the overhead work is now being erected. Both bracket and span construction will be used. The transmission line will carry 33,000 volts. Three substations are under construction, the equipment having been ordered from the Westinghouse Electric & Manufacturing Company. J. T. Adams of Columbus, O., has the contract for tracklaying and D. H. Robinson of Indianapolis, Ind., has the contract for the overhead work. Gaylord Thompson of Cincinnati is chief engineer. It is reported that the Lima-Defiance line will not be electrified this summer as expected. (Noted March 14.)

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has just completed an extension on South Tenth street to Riverview park.

Oregon Electric Railway, Portland, Ore.—G. W. Talbot, vice-president and general manager, writes that the Willamette Construction Company will begin about April 20 the construction of the branch line from Garden Home to Hillsboro, Ore., 12 miles. Work on the extension from Salem to Albany, 27 miles, will probably not be started until late summer. W. S. Barstow & Co., Portland, engineers. (Noted April 11.)

Paducah Southern Electric Railroad, Paducah, Ky.—H. H. Loving, secretary, writes that this company proposes to build an electric railway from Paducah to Mayfield, Fulton and Hickman, Ky., 70 miles, although the first section from Paducah to Mayfield, 25 miles, is the only one contemplated at present. The Southern Construction Company of Paducah has been organized to build the line. The line has been located by the American Engineering Company of Indianapolis. Franchises and a private right of way 100 feet wide have been obtained. Mr. Loving states that the company's bonds are now being subscribed for freely and it is expected that construction will be started in a short time. John C. Short & Son, 51 Liberty street, New York City, are making negotiations for the construction and equipment. (Noted January 11.)

Saginaw Owosso & Lansing Railway, Detroit, Mich.—It is reported that construction is to begin in a few months on the proposed line from Saginaw to Lansing, Mich., via Owosso and Laingsburg, 64½ miles. Surveys have been completed and the right of way secured. The officers are: President, C. W. Baird; secretary, Frank West; treasurer, George M. Black; general manager and chief engineer, J. A. Thick. (Noted March 16, 1907.)

San Jacinto, Cal.—It is reported that construction is to be started this summer on the proposed electric railway from Redlands to San Jacinto and Hemet, Cal. Preliminary surveys have been made. W. F. Whittier of San Francisco is interested.

South Richmond Railway, Richmond, Va.—It is reported that plans are being prepared by C. P. E. Burgwyn and others of Richmond, for the construction of an electric railway about five miles long in the vicinity of Richmond, from Fulton to Warwick Park, partly via the Osborne turnpike and partly on private right of way. Those interested in the line hold an old charter under the name of the South Richmond Railway, but it is proposed to secure a new charter. Work is to be started as soon as the right of way can be secured. Power is to be purchased from the Virginia Passenger & Power Company.

Spokane & Inland Empire Railroad, Spokane, Wash.—A. M. Lupfer, chief engineer, writes that eight miles of track have been laid this year on the extension from Palouse, Wash., to Moscow, Idaho, 15.5 miles. The bridge work and 95 per cent of the grading have been completed. Overhead construction will be started about May 1. (Noted March 21.)

Stroudsburg & Water Gap Street Railway, Stroudsburg, Pa.—This company is reported to have let a contract for a new bridge across McMichael's creek at Stroudsburg. A. A. Holbrook, general manager, Wilkesbarre, Pa.

Texas Traction Company, Dallas, Tex.—President J. F. Strickland has announced that regular operation on the line from Dallas to Sherman, Tex., 65 miles, will be in regular operation before July 1. A report made by the chief engineer, Fred A. Jones, states that grading is practically completed, 58 miles of track have been laid, 40 miles of poles have been erected and about 25 miles of overhead construction have been completed. The equipment for the power house at McKinney has been installed and has been operated and the substation installations will be completed within three weeks. (Noted March 28.)

Thermopolis, Wyo.—S. A. Broadwell states that his street railway line from Thermopolis to Thermopolis Hot Springs, 1½ miles, will be completed this spring.

Vincennes West Baden & Louisville Railroad, Vincennes, Ind.—It is reported that this company expects to begin construction during June or July on its proposed line connecting Vincennes, Monroe City, Petersburg, Algiers and Jasper, Ind., 42½ miles. The capital stock is $1,500,000. President, Thomas H. Adams; secretary, Anthony M. Yelton.

Wabash Valley Railroad.—It is reported that construction is to begin at once on this proposed line from Danville, Ill., to Perrysville, Ind. D. C. Johnson of Clinton, Ind., is president. (Noted February 29.)

Washington Westminster & Gettysburg Railroad, Washington, D. C.—James B. Colegrove, president, states that financial arrangements have been made for the construction of the proposed line from Washington, D. C., to Gettysburg, Pa., via Sandy Springs, Laytonsville and Westminster, Md., 80 miles. Right of way is now being secured. Walter Atlee is chief engineer. (Noted January 11.)

Winnebago Traction Company, Oshkosh, Wis.—J. P. Pulliam, superintendent, writes that an extension of the Oshkosh-Omro line to Berlin, Wis., is contemplated, but no definite plan has yet been decided upon. (Noted April 4.)

POWER HOUSES AND SUBSTATIONS.

Black Hills Traction Company, Deadwood, S. D.—We are advised by F. P. Wood, superintendent, that this company has recently acquired additional water rights and will this year increase its generating capacity. The company is engaged in the sale of power to milling, mining and lighting companies.

Cincinnati (O.) Traction Company.—This company is reported to have let contracts for the erection of a substation to be installed in its Brighton car house.

Coquille Valley Power Company.—J. S. N. Smith, Coos Bay, Ore., consulting engineer of this recently organized company, has announced that surveys for a pipe line, flumes and power house to be located midway between Marshport and Roseburg, Ore., have been completed. The immediate capacity of the plant will be 4,000 horsepower, which can be increased later to 12,000 horsepower. The distribution system will include a transmission line 33 miles long.

Crookston, Minn.—It is reported that Elias Steenerson and others have employed engineers to make preliminary surveys and estimates on the cost of a dam across the Red river of the North near Climax, Minn.

Escanaba Electric Street Railway, Escanaba, Mich.—We are advised that hereafter this company will purchase its power from the Escanaba Pulp & Power Company. This arrangement will take effect as soon as the power company's plant on the Escanaba river is completed. The power plant machinery is on the ground awaiting the completion of the dam across the river.

Interurban Railway & Terminal Company, Cincinnati, O.—This company has just purchased from the John A. Stewart Electric Company, Cincinnati, for installation in its main power house near Coney Island, O., two 300-kilowatt 25-cycle rotary converters complete with oil cooled transformers and switchboards.

National Construction Company, Smyrna, Del.—John D. Thompson, architect, Wilmington, Del., is said to be preparing plans and specifications for a power station to be built at St. Georges, Del. J. W. Endean, chief engineer and general manager of the construction company, holds like offices in the Smyrna Kent County & Delaware Bay Traction Company.

Norfolk & Portsmouth Traction Company, Norfolk, Va.—We are advised by E. C. Hathaway, general manager, that this company has under construction in Portsmouth a substation which will receive current from Norfolk by means of submarine cable. (Noted April 11.)

North Coast Water & Power Company, Lewiston, Idaho.—This company has made application for the lease of land near the city pumping station to be used as a site for a temporary power plant.

Portland Railway Light & Power Company.—It has been announced in Portland, Ore., by B. S. Josselyn, president, that plans are being drawn for a new substation to be erected on Northern Hill.

St. Joseph Railway Light Heat & Power Company, St. Joseph, Mo.—This company is reported to be considering the expenditure of $50,000 in increasing the capacity of its power station.

Personal Mention

Mr. George P. Hilton has resigned as director of the United Traction Company, Albany, and the Hudson Valley Railway, Glens Falls, N. Y.

Mr. H. M. Lambert, who recently was appointed chief dispatcher of the Spokane & Inland Railroad, Spokane, Wash., has been appointed trainmaster; effective on April 1. Mr. A. S. Bimrose will succeed Mr. Lambert as chief dispatcher.

Mr. W. O. Woodward, division passenger and freight agent of the Ohio Electric Railway at Dayton, O., and Mr. J. O. Larson, division passenger and freight agent at Springfield, O., have resigned and the positions have been abolished. As previously noted, Mr. F. A. Burkhardt has been appointed assistant general passenger and freight agent, with headquarters at Lima and Dayton.

Mr. R. W. Harris, general superintendent of the Joplin & Pittsburg Railway, Pittsburg, Kan., has been appointed general manager of the road, succeeding Mr. P. P. Crafts, resigned. Mr. Harris formerly was general manager and purchasing agent of the Illinois Light & Traction Company at Streator, Ill., resigning last December to become general superintendent of the Joplin & Pittsburg road.

Mr. Frederick S. Berry, heretofore superintendent of the Orange County Traction Company at Newburgh, N. Y., has been appointed general manager of the company, succeeding Mr. E. C. Boynton, resigned; effective on April 1. Mr. Berry was born at West New Brighton, Staten Island, N. Y., on December 31, 1872. He received a public school education and began railroad work in 1891, at the age of 19 years, starting as a conductor on the Port Richmond & Prohibition Park Electric Railroad. He operated the first electric car on Staten Island and for two years acted as conductor and motorman. He was then appointed assistant to the superintendent of the road and remained with the company through two reorganizations; the first in 1895, when W. B. Rockwell, manager of the Middletown-Goshen Electric Railway, assumed control, and the second in 1900, when the property was taken over by the Rockefeller interests. Mr. Berry remained with the company but a few months after the last change in ownership, resigning to go to Newburgh, N. Y., to reorganize the dispatching system of the Orange County Traction Company. He was chief dispatcher of the company for six years, receiving his appointment as superintendent about two years ago. Mr. E. J. Irwin, heretofore master mechanic, has been appointed superintendent of maintenance.

Frederick S. Berry.

Mr. Martin Ackerman, heretofore superintendent of the Youngstown & Ohio River Railroad, at Salem, O., has been appointed general manager of the Springfield & Xenia Railway, Springfield, O., succeeding Mr. R. R. Strehlau, resigned. Mr. Ackerman formerly was trainmaster of the Lake Shore Electric Railway, resigning the first of the year to become superintendent of the Youngstown & Ohio River line.

Mr. E. C. Boynton, who has been general manager of the Orange County Traction Company, Newburgh, N. Y., since October, 1906, has resigned; effective on April 1. Mr. Boynton formerly was connected with the New York New Haven & Hartford Railroad, the National Brake & Electric and other well-known companies. He is joint author with Mr. Albert Herrick of "American Electric Railway Practice."

Mr. Edgar H. Hyman, who has been appointed general manager of the Electric Package Agency of Cleveland, O., effective on April 1, has been connected with the company since June, 1898, a few months after its formation to operate over the lines of the Lake Shore Electric Railway and other properties of the Everett-Moore syndicate. Since that time Mr. Hyman has been in continuous service with the company, holding successively the positions of assistant auditor, auditor and treasurer and auditor. Since April 1, 1908, he has been general manager of the company, succeeding the late Charles A. Kenworthy, whose death was announced in the Electric Railway Review of April 4. Mr. Hyman still retains his position as treasurer and auditor.

Mr. Howard F. Grant, for the past five years manager of the Seattle (Wash.) Electric Company, one of the Stone & Webster properties, has been appointed district manager of the properties in the northwest. Mr. Grant began his railroad career with the Eastern Railroad at Portsmouth, N. H., where he was employed as watchman, later being placed in charge of the company's kyanizing plant at Portsmouth. A year later he was appointed to a clerkship in the maintenance of way department and was afterward made chief clerk of the department. With the consolidation of the Eastern Railroad and the Boston & Maine he was appointed chief clerk of the maintenance of way department of the combined system, in which capacity he served for 10 years. He then resigned to accept a position with the West End Street Railway of Boston as secretary to the general manager, later being appointed secretary to the vice-president of the Boston Elevated Railway, the successor of the West End company. On January 10, 1903, he resigned to become associated with the Stone & Webster interests at Seattle, where he has since remained. Mr. E. E. Potter has been appointed acting manager of the Seattle Electric Company to succeed Mr. Grant.

Howard F. Grant.

Mr. Melville Dozier, Jr., whose portrait is presented herewith, has been appointed assistant general manager of the Northern Electric Railway at Chico, Cal., as announced in the Electric Railway Review of April 11, 1908. Mr. Dozier was born in California and is a graduate of the Los Angeles high school and the engineering department of the University of California. He finished his engineering course in 1899 and shortly afterward was appointed assistant engineer of the Southern Pacific Railway, where he remained until 1901, resigning to become assistant engineer of construction of the Pacific Electric Railway at Los Angeles. In 1904 he was appointed engineer of maintenance of way for this company and the Los Angeles Interurban Railway. He resigned in 1906 to become president and chief engineer of the Vallejo & Northern Railway Company, which was organized to build an electric railway 52 miles long from Sacramento to Vallejo, Cal. From 1906 until March, 1908, he was engaged in locating the main and branch lines of this proposed interurban road, as well as having in charge the acquiring of right of way and terminal sites, the negotiations for which were concluded before he accepted his present position. The Northern Electric Railway, of which he is now assistant general manager, comprises 116 miles of interurban and street railways, including the Chico Electric Railway, the Marysville & Yuba City Street Railroad and the Shasta & Southern Railway.

Melville Dozier, Jr.

Financial News

Brooklyn Rapid Transit Company.—The following statement has been issued for the six months ended December 31, 1907: Gross earnings—Passenger, $9,919,366; freight, mail and express, $191,251; advertising, $77,553; American Railway Traffic Company, $211,401; total earnings from operation, $10,399,571. Operating expenses—Maintenance of way and structures, $527,807; maintenance of equipment, $945,104; operation of power plant, $843,703; operation of cars, trainmen's wages, $1,734,082; operation of cars, other expenses, $786,047; damages and legal expenses, $503,219; general expenses, $318,131; freight, mail and express expenses, $115,353; American Railway Traffic Company expenses, $167,280; total operating expenses, $5,940,726; earnings from operation, $4,458,845. Income from other sources—Rent of land and buildings, $40,809; rent of track and structures, $48,794; miscellaneous, $268,961; total income, $4,817,409. Deductions—Taxes, $464,902; interest and rentals, net, $2,788,597; total deductions, $3,253,499; net income, $1,563,910; special appropriations, $211,705; surplus, $1,352,205.—The New York stock exchange has listed $1,595,000 of first refunding mortgage convertible 4 per cent bonds, making the total amount listed $30,652,000.

Chicago City Railway.—The following report for the fiscal year ended January 31, 1908, has been made to the city of Chicago:

Gross earnings		$ 8,215,196
Operating expenses (70 per cent)		5,750,637
Net (30 per cent)		$ 2,464,559
Interest at 5 per cent on capital investment		1,236,009
Net earnings		$ 1,228,550
Net earnings divisible as follows:		
City of Chicago	$675,703	
Chicago City Railway	552,550	
		$ 1,228,550
Total valuation of property as of January 31		$29,052,145

The balance sheet as of January 31, 1908, follows:

Assets.

Value of property June 30, 1906		$21,000,000
Additions to property value since June 30, 1906		8,052,145
Total value of property		$29,052,145
Divisible profits	$1,228,550	
Less trolleyization taxes paid the city of Chicago	3,333	
		1,225,217
Total assets		$30,277,362

Liabilities.

Investment		$29,052,145
Profits	$676,703	
Less trolleyization taxes	3,333	
		672,369
Company profits		552,848
		$30,277,362

Chicago Railways Company.—Stockholders of the North Chicago Street Railroad and the West Chicago Street Railroad met on April 6 to protest against the assessment levied on account of claims aggregating $245,000. These claims have been presented since the Chicago Railways Company acquired the properties of the Chicago Union Traction Company. The assessments on the stock of the North Chicago road and the West Chicago road, $1.98 and $1.28 per share, respectively, were voted by a majority of the directors of those companies. The minority directors held that the assessments should not have been voted. The claimants are: Henry A. Blair, as receiver, $150,000; Henry S. Robbins, counsel fees, $30,000; W. J. Calhoun, counsel fees, $40,000; Frederick H. Rawson, bank expenses, $25,000; total, $245,000. The principal protest was concerning the fee asked by Mr. Blair. It was stated that he was allowed $81,000 by the United States court for his work as receiver and that this amount was ample compensation.

Little Rock (Ark.) Railway & Electric Company.—An issue of $5,000,000 of refunding and extension mortgage bonds has been authorized. The Bank of Commerce & Trust Company of Memphis, Tenn., is trustee. The bonds are dated April 1, 1908, and are due on April 1, 1938. The interest is to be such rate, not exceeding 6 per cent, as may be fixed by the directors from time to time prior to issue, and designated in the bonds. The purpose of the issue is as follows: (1) $2,000,000 bonds will be reserved to retire $2,000,000 underlying first mortgage 5 per cent bonds. (2) $500,000 bonds may be issued by the company from time to time. (3) The remaining $2,500,000 bonds may be issued for subsequent additions, after proceeds of five instalments of $500,000 each have been spent for improvements, on the following basis: (a) $1,000 in bonds for each $1,250 so expended; (b) provided that net earnings are at least twice the interest charges; and that (c) maintenance expenditures charged to operation are at least 10 per cent of gross earnings. The first $500,000 bonds will be issued as 6 per cent bonds. There is a sinking fund provision under which annually, beginning with 1913, one-half of 1 per cent of the bonds outstanding will be taken up. The bonds are not subject to call, but may be purchased at prices not above a 4½ per cent interest basis.

New Orleans (La.) Railway & Light Company.—Gross earnings from all sources in 1907 were $6,041,301, as compared with $5,773,190 in 1706. Expenses were $3,270,397, as compared with $3,074,015. Net earnings were $2,770,904, as compared with $2,699,175. The net divisible income was $745,267, as compared with $798,274. The annual report will be reviewed at length in a later issue.

New York City Railway.—Judge Lacombe of the United States circuit court, New York, has filed a memorandum concerning the issue of $3,500,000 certificates by the receivers of the New York City Railway and the Metropolitan Street Railway. Judge Lacombe says: "As has been noted many times the property was in a deplorable condition when receivers took possession and it became at once manifest that in order to secure a proper and efficient service it would be necessary to expend a large amount of money on improvements and equipment. It was foreseen then, as the event has shown, that the cost of such work would have to be borne by the property; its income is wholly insufficient." Judge Lacombe said that "it would seem that the lessor company (Metropolitan) might have a good cause of action against the lessee (New York City Railway) for waste in allowing the leased property to go to wreck."

Underground Electric Railways, London.—Sir George Gibb was appointed receiver on April 15 on application of Speyer & Co. of New York, acting on behalf of themselves and other holders of the profit-sharing notes of the company.

United Railways & Electric Company, Baltimore.—Gross earnings in 1907 were $7,018,082, an increase of $434,979, or 6.61 per cent, over the previous year. Operating expenses were $3,470,087, an increase of $249,145, or 7.74 per cent, over the previous year. The surplus after the payment of fixed charges and taxes was $1,066,557, of which $1,028,899 was used for extraordinary expenditures. The annual report will be reviewed at length in a later issue.

Manufactures and Supplies

ROLLING STOCK.

Murphysboro Electric Railway Light Heat & Power Company, Murphysboro, Ill., will buy a number of cars.

Dayton Street Railway, Dayton, O., is considering the purchase of a number of cars. C. H. Bosler, 816 Reibold building, is general manager and purchasing agent.

Centralia & Central City Street Railway, Centralia, Ill. is in the market for one 15-bench open motor car and one 15-bench trailer. The company is also ready to buy its year's supply of brakeshoes.

Grand Central Traction Company, Indianapolis, Ind., under construction, is reported to be in the market for a number of interurban cars. W. D. Whitney, Muncie, Ind., is president.

Lehigh Valley Transit Company, Allentown, Pa., which was reported in the Electric Railway Review for April 11 to be in the market for four interurban cars, has placed the order with The J. G. Brill Company.

Choctaw Railway & Lighting Company, McAlester, Okla., is in the market for two trail cars. A description of two new interurban motor cars built for this company appeared in the Electric Railway Review for April 4.

Chicago Railways has placed an order with the Pressed Steel Car Company for 50 all-steel pay-as-you-enter type cars. This is in addition to the 300 cars ordered from the Pullman Company, as reported in the Electric Railway Review for March 21. The all-steel cars will have the same controlling dimensions as the wooden cars. The railway company will equip all the new cars with International fare registers, National standard roofing and Schroyer friction curtain rollers.

SHOPS AND BUILDINGS.

Boston Elevated Railway, Boston, Mass.—This company lost a car house, one car and seven snowplows in the recent fire at Chelsea, Mass.

Louisville & Northern Railway & Lighting Company, New Albany, Ind.—A contract for a new station building at Louisville, Ky., has been awarded by this company.

TRADE NOTES.

Railroad Supply Company, Chicago, on May 1 will remove its New York offices to 540 Hudson Terminals, Cortlandt building.

Grand Rapids Electrical Show Association, Grand Rapids, Mich., will hold an electrical show in that city from May 11 to May 16.

Pay-As-You-Enter Car Company, New York, has removed its offices from 26 Cortlandt street to the Hudson terminals, Fulton building.

Paul B. Patten, Salem, Mass., manufacturer of the Patten ticket destroyer, died on April 6. The estate of Mr. Patten will continue the business.

J. G. White & Co., Inc., New York, has declared the regular quarterly dividend of 1½ per cent on the preferred stock, payable April 2 to stock of record April 1.

Chester Railway Supply Company, Chester, Pa., has recently secured an order from the Philadelphia Rapid Transit Company for a large number of Dyer improved trolley ears for use on one of its lines.

Northern Engineering Works, Detroit, Mich., has shipped one 12-ton traveling crane to the Sodeman Light Heat & Power Company, Johnstown, Pa., and one 5-ton traveling crane to the Mineral Wells Electric Company.

United Indurated Fibre Company, Lockport, N. Y., has received a contract from the Philadelphia Rapid Transit Company for special insulating rail covering to be used in protecting the third rail on the Market Street Elevated Railroad.

Robert C. Pruyn, president of the Consolidated Car-Heating Company, New York and Chicago, and Francis C. Green, general manager, have declined re-election to their offices in the company. Their successors will be elected at the annual meeting in June.

Bristol Company, Bridgeport, Conn., has come under the control of William H. Bristol, whose inventions the company has been manufacturing since its organization. The business which Mr. Bristol has conducted in New York under the name of William H. Bristol will be consolidated with the Bristol Company, and, as a result, it is said the company will handle the most complete line of recording instruments available.

Dressel Railway Lamp Works, 3866 Park avenue, New York, on account of greatly increased business throughout the west, has appointed Edward W. Hodgkins as western sales manager, effective May 1. Mr. Hodgkins, who is well known in railway circles, will have offices in the Western Union building, Chicago.

Crocker-Wheeler Company, New York, on April 21 will move to its new quarters in the Hudson Terminals, Cortlandt building. The company believes the new location will prove of special convenience to its customers and itself, as it will bring the New York office into closer touch with the works and main offices at Ampere, N. J.

E. E. Keller, for over 20 years connected with the Westinghouse interests and for 14 years vice-president of the Westinghouse Machine Company, having completed his duties as receiver and general manager, severed his connection with the management of that company on April 1. Mr. Keller will take a much needed rest and will then devote most of his time to several personal interests.

Quincy, Manchester, Sargent Company announces that in order to devote more attention to its metal sawing machines, cranes and hoists and car steps, it has decided to discontinue the manufacture of the line of pneumatic compression riveters acquired when the business of Pedrick & Ayer Company was purchased. The Quincy, Manchester, Sargent Company has disposed of the entire line to the Hanna Engineering Company, Chicago, and states that the latter company will make improvements on it and will be able to furnish repair parts for such riveters as have been sold in the past.

Wheeler Condenser & Engineering Company, Carteret, N. J., announces that Charles S. Lewis & Co., Granite building, St. Louis, Mo., will handle Wheeler apparatus in the state of Missouri. This includes the well-known Wheeler surface, jet and barometric condensers, feed water heaters, reheaters and receivers, vertical engines, centrifugal pumps, rotating dry vacuum pumps and vacuum pans and multiple effects. It also covers the Voltz combined condenser and feed water heater, Barnard-Wheeler water cooling towers and the Edwards air pump, which has the unique distinction of replacing wet vacuum pump, dry vacuum pump and precooler in condenser equipment. As the Edwards pump contains no suction valves, the pump is as effective in removing air as a dry vacuum pump having mechanically operated admission valves. This pump is widely applied for other vacuum work, as well as with condensers. It is built in various combinations, single, duplex and triplex, for steam and electric drive, etc.

Westinghouse Electric & Manufacturing Company's stockholders' committee, consisting of Charles F. Adams, Charles J. Canda, George W. Guthrie, Alvin W. Krech and George T. Oliver, has issued a circular approving the merchandise creditors' plan for the readjustment of the company's debt. This plan was described at length in last week's issue. The circular from the stockholders' committee says in part: "We are informed by the officers of the company that the company's outstanding capital stock of $27,938,100 represents an actual cash investment considerably in excess of $30,000,000 above the debt. For six years the company has been regularly paying dividends upon both its preferred and 'assenting' stock, the dividend rate for the three years prior to the receivership having been 10 per cent per annum. The statement (prepared by Haskins & Sells, the company's accountants) of gross sales and net income for the period of seven years and seven months ended on October 31, 1907, indicates that the receivership came at the height of the company's prosperity, so far as earnings are concerned. The chief difficulty with the company and the principal cause of the receivership are found in the fact that, as the result of the rapid expansion of its business, too large a proportion of its investment is represented by debt. If a substantial reduction can be made in the debt by the sale of additional stock, it is believed that the receivership can be promptly terminated, with every prospect of the company entering upon a career of renewed prosperity. The merchandise creditors' plan cannot be carried into effect unless the stockholders protect themselves by subscribing pro rata for their shares of this new stock. If these subscriptions are not forthcoming the inevitable result will be that the readjustment committee, which was organized for the protection of creditors, will be forced to reduce the debt of the company to judgment, bring about a forced sale of the property and its acquisition by a new corporation organized in the interest of creditors. Such a course would result in enormous loss, which would fall chiefly

upon the stockholders of the company. That loss can be avoided only by the co-operation of stockholders in promptly subscribing for a sufficient amount of new stock to insure an early termination of the receivership."

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

Rodger Ballast Car Company, Chicago, Ill.—A series of neat blotters illustrating the Hart convertible car is being distributed.

Refined Iron & Steel Company, Pittsburg, Pa.—A leaflet entitled "Confirmation of Quality" contains copies of correspondence and reports which indicate the superior quality of the refined iron produced by this company.

American Conduit Company, 140 Nassau Street, New York, N. Y.—Bulletin No. 242 presents data regarding materials required for concrete and brick manholes in connection with the use of bituminized fiber conduit for underground construction.

General Storage Battery Company, Boonton, N. J.—Bulletin No. 9 sets forth the advantages of "Permanized" negative plates for high duty storage batteries. Charts are employed to show their superiority over various Planté type plates.

National Brake & Electric Company, Milwaukee, Wis.—Bulletin No. 38 describes the National type "3VS" air compressor, which is built for electrical operation, in capacities of 50, 100, 150 and 225 cubic feet of free air per minute. They are furnished for operation on direct-current or alternating-current circuits, either by direct connection, belt drive or water wheel drive.

General Fireproofing Company, Youngstown, O.—Recent publications include illustrated leaflets showing the application of plain and cold twisted lug bars and pin-connected girder frames in reinforced concrete construction. One is devoted to the filtration plant at McKeesport, Pa.; another to the Studebaker Brothers Manufacturing Company office building at South Bend, Ind.; and the third to the Central Pennsylvania Lumber Company plant.

General Railway Supply Company, Marquette Building, Chicago, Ill.—An attractive catalogue illustrates and describes the merits of a number of patented railway specialties, including metallic (steel) sheathing for passenger cars, the National steel trap door and lifting device, the Schroyer friction curtain roller, the Garland ventilator for both passenger and refrigerator cars, Flexolith composition flooring for passenger, express and baggage cars, National vestibule curtain catches, National standard roofing for all passenger equipment and the Ideal roller center plates.

Crocker-Wheeler Company, Ampere, N. J.—Recent publications include Bulletin No. 95, devoted to belt type alternating-current generators, especially designed to be used in adding electric units to plants which have spare engine capacity, and where quick installation is an important consideration.—Bulletin No. 97 illustrates and describes various types of direct-current switchboard panels.—Bulletin No. 98 (superseding No. 78) shows form L direct-current motors and generators, which are built to meet any condition requiring small power for either belt or gear drive or for direct connection.—Bulletin No. 99 is a reprint of a technical article describing Crocker-Wheeler motors in the rail and structural mills of the Bethlehem Steel Company.—Bulletin No. 100 has for its subject form I direct-current machines, which are built in motors from 5 to 45 horsepower and in generators from 4½ to 40 kilowatts. They are adapted for either belt, gear or direct drive and are especially applicable to machine tools.

General Electric Company, Schenectady, N. Y.—Bulletin No. 4573 describes the complete line of graded shunt resistance multigap lightning arresters designed by the General Electric engineers for 1908. It also contains detailed descriptions of low-voltage arresters, static dischargers, constant-current horn arresters, disconnecting switches, choke coils and the well-known type M D-2 direct-current arrester for voltages up to 6,000. Tables of general data regarding the apparatus, connection and dimension diagrams, etc., are included. The bulletin discusses briefly the theory upon which the arresters operate and their details of construction. It is bound in an artistic cover.—Bulletin No. 4570 describes and illustrates the General Electric tungsten lamp for 100 to 125 volt circuits. The lamp is made in 40, 60 and 100 watts, and has a life of approximately 800 hours when used on either alternating or direct current. Some of the illustrations show the tungsten incandescent units combined with standard holophanes, which can be used to excellent advantage in this manner.

VENTILATING NEW YORK CENTRAL POWER STATIONS.

The electrification of the New York Central and terminal at New York brought up an interesting problem in the heating and ventilation of the storage battery stations at Lexington, Yonkers, Kingsbridge and Bronx Park. The company which installed the storage batteries was willing to guarantee them for 10 years, provided the temperature was maintained at 70 degrees F., and this necessitated a heating plant for cold weather and a means of cooling in warm weather, as well as proper ventilation at all times.

The acid fumes from the batteries precluded heating by direct radiation, as the fumes would destroy the radiation and pipe lines, and hence the blower system was adopted. By

Ventilating New York Central Power Stations—Battery Room, Yonkers.

using this system the entire heating plant is centralized in a detached building, the air being delivered to the various portions of the building by ducts, protected in such a manner as to resist corrosive action.

So far five of these stations have been equipped. In the power house at Yonkers the battery rooms, busbar chambers,

Ventilating New York Central Power Stations—Heating and Ventilating Room in Switchhouse.

corridors, stair halls, controller chambers, etc., are the portions heated and ventilated by the blower system.

The air is circulated through a sectional pipe heater by a steel plate fan, which is driven by a belted motor. Steam is supplied by a small low-pressure boiler, which is located in an adjacent room. The air discharged by the fan is distributed at the proper temperature, by suitable ducts, to the various apartments. Two methods of distribution have been used.

In the Yonkers power station carefully protected galvanized iron ducts are used as shown in one of the illustrations. In the other substation battery rooms there is no piping, the air being admitted at one end of these rooms

through tile conduits terminating at registers made of 95 per cent lead and 5 per cent antimony.

The results, blowing air in at one end of the battery rooms, have been as satisfactory as when the air is distributed throughout the room by ducts with branches therefrom at frequent intervals; the advantages of having no ducts are apparent. Ducts do not add to the appearance of the room and are costly to install and require frequent attention to keep them in a condition to resist the acid fumes.

This system is very compact, easily accessible and under perfect control at all times, while moderate in cost, easily installed and economical in operation and maintenance. Another feature of exceptional value is the absolute flexibility, it being possible to deliver the air at any temperature without diminishing the volume, so that thorough ventilation is provided for the battery rooms while the batteries are being charged.

These heating and ventilating systems were designed by the American Blower Company of Detroit, Mich., and its apparatus was installed by John Hankin & Bro., heating contractors, New York City.

ROOKE REGISTERS GIVE SATISFACTION.

In an interview relative to the use of the Rooke automatic fare collector, A. E. Potter, general manager of the Rhode Island Company, Providence, R. I., stated that the collectors were first used on his lines in April, 1907, when they were adopted as an experiment on a line running to one of the smaller car houses of the company. The results of this trial, Mr. Potter stated, were so gratifying that the use of these collectors has gradually been extended until at present, with the exception of three lines, they are used on the company's entire system.

The public in general took kindly to the new method of fare collection, the only real trouble having been experienced with those having imaginary grievances or from relatives of discharged employes. While at first a disposition was shown on the part of some of the younger conductors who did not intend to remain in the business, to attempt to make the new system a failure, the older conductors were quick to recognize its value and their co-operation is now assured. Mr. Potter said that from the first time his attention was directed to this method of fare collection he was impressed with its superiority as a means for the proper registration of all cash fares, and he believes that the successful results of the year's test fully bear out this impression and justify the adoption of the registers on the lines of his company.

ELECTRIC LOCOMOTIVES FOR CHICAGO SUBWAYS.

The accompanying illustrations represent one of 25 electric locomotives recently built by the Baldwin Locomotive Works, and equipped with electrical apparatus supplied by the Westinghouse Electric & Manufacturing Company.

The locomotives are for the Illinois Tunnel Company and are built for underground haulage in the city of Chicago. The mine type is conveniently used for such service, and the example shown is arranged for single-end operation. It is built for a track gauge of two feet. The frames are placed outside the wheels and the bumpers are of channel iron filled with oak buffers. A radial drawbar with automatic coupler is provided at each end of the locomotive. The wheels are 28 inches in diameter, spaced 2 feet 7 inches between centers. The journals are $3\frac{3}{4}$ by 7 inches. The approximate weight of the locomotive is 11,000 pounds.

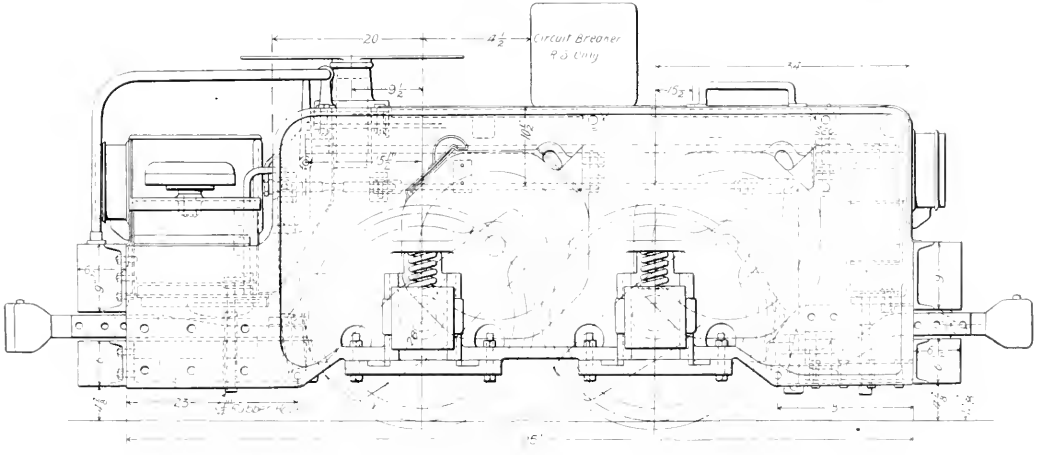
The electrical equipment includes two No. 155 motors, suitable for 250 volts pressure. They are tandem hung, that is, away from the controller end on their respective axles. As

Illinois Tunnel Locomotive—Side View.

they are suspended in an angular position, a short wheel base can be used, enabling the locomotive to traverse sharp curves without difficulty.

The brakes are of the screw type, operated by hand. Four sand boxes are provided with spouts to all wheels. The trolley pole is placed on the center line, near the operating end.

The flexibility of any electric power system is one of its chief advantages, and in the case of the locomotive this is a feature of great importance. The example shown represents but one of many types of Baldwin-Westinghouse locomotives recently built for industrial haulage. These motors can be designed to fulfill practically any conditions existing in work of this character.



Illinois Tunnel Locomotive—Elevation Showing Arrangement of Motors and General Dimensions.

SOME IMPORTANT PAINT TESTS.

BY G. B. HECKEL, SECRETARY PAINT MANUFACTURERS' ASSOCIATION OF AMERICA.

Paint tests which promise to furnish valuable data have been undertaken in several parts of the country by the Paint Manufacturers' Association of the United States.

The first of these tests was begun nearly two years ago by the North Dakota Agricultural College at Fargo, at the request of the association, which contributed a sum of money for the purpose. The formulas representing the paint manufacturers' products were selected by Professor Ladd, in conference with the writer, and Professor Ladd invited white lead manufacturers and others to participate, which they did. The formulas furnished for the paint manufacturers numbered 16, representing all the popular and successful types of prepared paints on the market, ranging from a base of straight lead and zinc in varying proportions to a combination of zinc and barium sulphate. In these formulas all the reinforcing or inert pigments were represented, including silica, calcium carbonate, calcium sulphate, magnesium silicate, etc., the object being to provide formulas which, without duplicating existing paints, would each stand as typical of its class.

The paints were applied under Professor Ladd's supervision, the North Dakota Agricultural College being represented by Dr. C. D. Holley as official inspector and the Paint Manufacturers' association by its official inspector, J. B. Campbell.

The North Dakota tests have been so frequently described in the technical press that it will be more interesting to describe the methods pursued in two more recent tests of a similar character. The North Dakota test, being the first undertaken, was somewhat crude in its details, though much valuable information is expected to be obtained from it. But in the course of the work several facts impressed themselves on those interested, the first being the exceptionally favorable character of the North Dakota climate. The air is normally dry, the summers are not hot and the winters, even if cold, are equable and not subject to hydroscopic extremes. It was therefore decided that a series of similar tests should be undertaken on an enlarged scale at other points in the country, where climatic conditions are different.

To initiate this new series Atlantic City, N. J., and Pittsburg, Pa., were selected as typical of severe painting conditions. Committee E (the committee on "Protective Coatings") of the American Society for Testing Materials was requested to supervise the work at Atlantic City and the Carnegie Institute that at Pittsburg. Both accepted. From committee E a subcommittee consisting of Robert Job, chairman; A. H. Sabin, Percy H. Walker of the department of agriculture, W. A. Akin, Joseph F. Walker, S. S. Voorhees and G. B. Heckel was selected to supervise and inspect the work; while the Carnegie Institute selected for the purpose five heads of its technical departments, with Prof. J. H. James as chairman.

A board fence 178 feet long by 5½ feet high, running north and south, was erected in each case and primed with Prince's mineral paint. Panels of Dutch weatherboarding, 3 feet by 15½ inches, were prepared from yellow pine, poplar and cypress, each piece of lumber used in these panels being inspected by a professional lumber inspector, those accepted by him being branded and the rest rejected. It throws an interesting sidelight on modern painting conditions to know that about 50 per cent of the lumber received from the mills was rejected as unfit.

The paint formulas tested include those used in the original North Dakota tests, with the addition of a number of formulas representing the various pigments and combinations of pigments in common use for the painting of wood structures, including a dozen or more brands of white lead purchased in the open market, zinc oxides, sublimed white lead, zinc lead white, lithopone, etc. A series of greens is also being tested at Atlantic City by request of the Philadelphia Master Painters' Association, which finds great difficulty in obtaining a green that will not mildew in this locality.

Committee E selected for its official inspector James P. Parthree from the Wilmington shops of the Pennsylvania Railroad, who was kindly given leave of absence for the purpose. The Pennsylvania Railroad also lent the ground at Ventnor for the erection of the fence, which faces the ocean on the one hand and Little Egg Harbor bay on the other.

The painting of the panels was done under cover in each case, so as to obtain, in so far as possible, initial uniformity of conditions. This precaution was not observed in the Fargo tests; indeed, in view of the equable climatic conditions, was not so essential. It is obvious, however, that comparison between two paints is impossible if one be applied in the open on a damp, foggy day and the other on a clear, dry day.

The formulas are prepared in three colors—white, light yellow and light gray. Each of these colors in each formula is applied in duplicate to each class of wood. There are thus, for example, two panels each of cypress, yellow pine and poplar painted in white with the formula composed of equal parts each of hydrocarbonate white lead, zinc oxide and barium sulphate (the familiar old "one-third each" formula) and these are duplicated in yellow and gray prepared on the same white paint base.

The formulas were ground by various manufacturers, the preparation of each being confided to the manufacturer presumably most familiar with the technical procedure of that particular type of paint. To each formula an identifying number was given, and as completed they were shipped in gallon cans to the chairman of the supervising committee, bearing only the formula number and the name of the Paint Manufacturers' association. Analyses of the vehicles, including the dryers used, were also furnished, together with a sample of the dryer, for further analysis in case of necessity.

When the work was ready the paints were turned over, in the unbroken packages, to the two inspectors.

The Master Painters' associations of Pittsburg and Philadelphia named the official painters for the two tests, the gentleman selected by the former being A. P. Rapp and by the latter George Butler. These gentlemen in turn deputed each an expert painter to do the actual work under the inspectors.

The inspectors themselves have entire charge of the work and keep complete duplicate records thereof as it proceeds. They also remove and retain sealed samples from each package as it is opened, one of which goes to the supervising technical body and the other to the Paint Manufacturers' association.

Each panel is branded with the number of the paint formula applied to it and a letter designating the wood of which it is composed.

The paints as furnished are about suitable in consistency for a finishing coat. The required thinning in each case is done by the inspectors, accurate records of kind and quantity being kept. Weighing before and after application preserves a record of the paint consumed for each coat and also gives the necessary data for ascertaining the spreading rate.

After the priming coat has been applied and allowed to dry a black cross is stenciled on the center of each panel. The degree to which this cross is obscured by the second and the third coat, respectively, indicates the relative opacity of the paint.

About one week was allowed for drying between coats, the inspectors alternating between Atlantic City and Pittsburg, and thus keeping the two tests in progress at the same time.

After complete drying of the third or finishing coats the panels were fastened to the fence by means of brass screws. This will permit their removal for laboratory inspection at any time. At one corner of each panel a small plate of clear glass and a duplicate plate of orange glass in a wood frame have been securely attached and sealed so as to exclude atmospheric agencies while allowing the light to reach the painted surface below. By this means it is expected to ascertain what effect, if any, the actinic rays of the sun have upon the durability of a paint film. The duplicate panels bearing the same paint formulas are placed one on each side of the fence, so that each undergoes an eastern and a western exposure.

Before the application of the paint each panel was carefully photographed on a fixed scale, with the lens stopped at 1-64, so as to secure detail, and these photographs have been filed for future reference.

The fence will be inspected by the subcommittee at intervals of about six months and each member will be provided with blanks upon which to record his individual judgment, the entire set of blanks being filed with the chairman of committee E for his guidance in making his annual reports to the association.

Of course, it is not expected that the results of these tests will settle finally and conclusively the relative merits of competing pigments and types of paint, but it is expected that they will furnish much valuable information, and as they are extended to other sections of the country, may furnish cumulative evidence that will be at least valuable and suggestive. At any rate, public paint tests on so large a scale and under conditions so nearly approximating scientific accuracy have never before been attempted in this country, and the paint-consuming public cannot but be benefited by the information which they will eventually furnish.

The New York New Haven & Hartford Railroad is installing a fourth generating unit at its Cos Cob power station. Electric operation from Stamford, Conn., to New York has been extended to include some of the through express trains; in all 83 trains on week days and 33 on Sundays are now hauled over this section by electric locomotives.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Wanted—A young man experienced in street railway and electric light accounting desires position as auditor. Best of references as to character and ability. Address "No. 573," care of Electric Railway Review, Chicago.

Expert street car electrician, city or interurban lines, desires a change. Fifteen years' experience; capable handling men; also railway park manager. Now with a large railway. Address "No. 578," care of Electric Railway Review, Chicago.

Wanted — Middle-aged man with 26 years' experience in railway operation and supplies and equipment wants to represent good firms in the southwest, with headquarters at Oklahoma City. (By permission refers to Electric Railway Review.) Address "No. 581," care of Electric Railway Review, Chicago.

Wanted—Position as superintendent of rolling stock or master mechanic on city or interurban railway. Have satisfactorily handled similar work on large metropolitan properties since horse car days. At liberty now; references exceptional. Address "No. 580," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Position wanted as superintendent and electrician of electric light and power station by man of 30, having 12 years' practical experience in construction and operation; thoroughly familiar with all systems adopted by modern plants for reducing expenses and adding to income; salary, $125. Address W. N. Alexander, Sidney, Neb.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Transportation man of seventeen years' experience, young, reliable and thoroughly familiar with organization, dispatching and timetable work, desires a position as superintendent or one of equal responsibility. Highest references regarding character, ability and past service. Address replies to "No. 577," care Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Technical men. Positions open in all departments. Write today if you will consider better position, change of location. Twelve offices. Service confidential. HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

Best general manager obtainable to construct and operate a new interurban system. Initial line only the beginning of a system. Give experience and reference. Address "No. 579," care of Electric Railway Review, Chicago.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

Wanted—Copies of Street Railway Review, January to June, 1906, inclusive, and one copy each January and February, 1906. Also Electric Railway Review for January 5, 1907. State condition and price. Address "No. 582," care of Electric Railway Review, Chicago.

Foreign $3
Canada . . . $3.50

After a careful investigation of 6-cent fares charged by the Blue Hill Street Railway, the Massachusetts railroad commission has found that the fare is reasonable for the distance included, considering the present financial condition of the company. The road runs from Mattapan, where it connects with the Boston Elevated Railway to Stoughton, Norwood and Hyde Park. The specific question involved was whether a 6-cent fare between Stoughton square and Canton crossing, a distance of 4.22 miles, was unreasonable, but the commission investigated the conditions on the road as a whole. In regard to the issuance of workingmen's tickets at a reduced rate the commission states that it at present sees no reason for a reduction, but if subsequent returns indicate that the company may with justice be called upon to issue some form of ticket for less than the present rates, an appropriate order will be given. This decision is probably the first of a number in connection with the allowance of "living returns" for street railways in Massachusetts operating outside the populous centers.

Six-Cent Fare Upheld in Massachusetts.

Down in New York the public service commission has been endeavoring to adjust differences existing between the New York Edison Company and its customers and possible customers, who are anxious to have breakdown electric service connections. Heretofore the power supply company has had its rates for breakdown service connections so high that operators of isolated plants have considered the costs for such service prohibitive unless their distribution circuits must give positive assurance against interruption from lack of current. The commission, however, has taken a hand and as a result the supply company has modified its rates for this service so that the charge shall be based upon the maximum demand of the consumer and not, as heretofore, on the capacity of his installation. This agreement operates for one year, during which time the company will place recording meters on all its breakdown connections and take records under the supervision of the commission for the purpose of determining how frequently such service is required. Therefore at the end of the year it should be possible for the customer, commission and generating company to determine a fair charge for the service.

Breakdown Service Charges.

There are many lessons yet to be learned in ticket handling and accounting methods. Well-written articles on this subject are always read with interest and therefore we are pleased to present in this issue a very complete discussion of the subject as written by P. P. Crafts, general manager of the Iowa & Illinois Railway, for presentation before the Iowa Street & Interurban Railway Association at Des Moines. The author tersely expresses the problem at hand when he says: "Too many of us look upon the money obtained from traffic as so much cash received and do not give sufficient thought to analyzing and preventing the small leaks which, taken individually, may be very small, but taken collectively amount to a good round sum each year. Such money is earned, yet neither collected nor accounted for." Mr. Crafts discusses the methods found most satisfactory for handling fares on roads having two distinct classes of traffic. One of the roads handles through traffic largely; the other gains its earnings almost wholly from short haul. A study of the requirements of the two systems showed that fare handling methods for one were entirely unsuited for the other, and from Mr. Crafts' discussion and comments on the situation much can be learned.

Tickets and Their Accounting.

We have had considerable to say in the past regarding the looping of tracks through yards, shops and car houses. Transfer tables, we believe, are a nuisance except in those special instances where real estate conditions will not permit a generous layout of special track work. Last week we presented an article by Thomas Pumfrey, engineer of the International Traction Company, describing the new Broadway car house in Buffalo. The ground plan of the structures and storage yards shows that there is a complete double-track loop around the buildings and that a car entering on any track at one end may run through the buildings or yards and pass out at the other end. This is an ideal arrangement and presents many valuable features. In a car house where at certain times during the day cars must be received on short headway for inspecton and cleaning, the through tracks permit of the maintenance work being carried out progressively and, as is done on the Chicago City Railway, the cars being moved ahead from one class of work to another until when they reach the farther end of the car houses they are ready for service. Through tracks also double the number of cars that can quickly be run out of the buildings in time of fire. These desirable factors, when combined wth the uncontroverted advantage on the score of flexibility, argue strongly for as complete consideration of the track layout at a railroad structure as usually is given the design of the building.

More Loop Tracks.

Many of the larger electric railways serving interurban and suburban districts have found the portable substation to be an important part of the power distribution system. With one exception we do not know of any road, however, which has fed these substations through any medium except the regular alternating-current high-tension feeders. It is a common practice to install such substations on stub-end sidings near the distribution center to be served and there to erect a pole so that temporary connections may be made with the high-tension wires already serving the permanent substations. This, of course, is the only method that can be pursued by an interurban railway, but where large city systems which operate suburban divisions find it advisable to use portable substations, another method of feeding current is possible. This method, which comprises the exception earlier referred to, is that of using the direct-current feeders as conductors to carry alternating current to the portable equipment. In last week's issue of the Electric Railway Review E. D. Smith, superintendent, described the portable substations of the United Railways Company of St. Louis in

Feeding Portable Substations.

an article which considers the entire power generating and distributing systems of that company. As implied, the use of direct-current feeders for carrying alternating current to a portable substation is, of course, made possible only by special conditions. The trolley taps must be taken off from a part of the direct-current feeders and these feeder cables must also be mounted on high-tension insulators. A special change-over switching and busbar arrangement is also required in the generating station. The principal advantage gained, other than those usually obtained from the use of portable substations, is that excessive localized loads may be handled on suburban divisions which are not paralleled with transmission lines.

Testing Samples of Paint.

Especial interest attaches to the paint tests which are now being carried out by the Paint Manufacturers' Association of the United States. These tests comprise exhibiting to weather conditions a large number of sample boards located at Atlantic City and Pittsburg. Either of these locations will give the various paint samples a severe service test. Atlantic City weather conditions include those of salt air and fogs, while the paints on the sample boards at Pittsburg will be subjected to air usually contaminated with smoke. Suffice it to say, the sample boards at Atlantic City will get the more sunshine. Especial care has been taken in preparing the boards so that like conditions of application will exist in both cities and the personal equation will be balanced by having the same corps of men do the work on both sets of samples. It is not expected that the results of these tests will settle conclusively the relative merits of competing pigments and kinds of paints, but it is expected that they will furnish much valuable information. Later a series of tests may be extended to other parts of the country and then cumulative evidence will be had which must be both valuable and suggestive.

SEGREGATION OF THE THIRD AVENUE RAILROAD.

Disintegration of the surface system of railways in New York City began with the appointment of an individual receiver for the Third Avenue Railroad and the subsequent order of the United States circuit court permitting the abolition of transfers at the points of connection between most of the lines of that company and the lines of the New York City Railway. Under the authority conferred by that order the transfers between these lines were discontinued at midnight, April 11. The course which these events indicate is evidently at wide variance with the programme which the public service corporation regulating body of New York City had anticipated. William M. Ivins, special counsel for the commission, said in an address before the City Club of New York on "The Metropolitan Street Railway System" on March 9: "I do not discuss the problems of disintegration and abandonment which are proposed to reduce transfers and save losses on the poorer routes—first, because the community will not have it so, and second, because in view of the facts and the law I don't see how it is to be done."

That the first steps have been taken notwithstanding the attitude of the community or the interpretation placed upon the facts and the law, is due to the anomalous situation respecting transfers, which required treatment just as much as the excessive overcapitalization, the insufficient maintenance charges and the failure to provide for depreciation of the property, to which Mr. Ivins called attention.

That the community had received more from the surface lines in the way of transfers than was its just due is plain from the statement of the man who showed that under the old system it was possible to ride all day for a 5-cent fare. Other facts that should be calculated are: The rapid increase in transfer passengers on the surface lines until they reached 55.13 per cent of the revenue traffic during a period of six months, when the revenue traffic was declining; the correspondingly rapid decrease in the rate of fare until it averaged 3.16 cents per passenger carried; and the development of the system of connecting lines until a ride could be secured from the Battery to Kingsbridge, a distance of 37½ miles, for a 5-cent fare. In his decision, which enabled the receivers of the respective companies to withdraw most of the transfers, Judge Lacombe stated: "It is obvious that a curtailment of transfer privileges * * * will increase the cash receipts of the properties affected, and since receivers are trustees for the creditors and owners their duty to operate the roads so as to increase earnings is equally obvious." With exceptions affecting several transfer points Judge Lacombe found no legal reason why transfers should not be discontinued.

If the companies had been solvent, going corporations they presumably would have had to secure the approval of the public service commission for any scheme for limiting the transfer privileges, but as bankrupt properties in the hands of the court, a truthful recital of the need of expenditures for neglected maintenance and of the state of earnings and obligations secured the desired end. The receivers of the New York City Railway stated to the court: "The condition of the entire operating property, except the power houses, when we took charge was deplorable. For a long time the operating company had confined its repairs to such temporary and makeshift work as would merely patch up worn-out parts, without any comprehensive and thorough reconstruction."

If the earnings are now conserved by curtailment of the transfer privileges and other sums which may be applied to reconstruction of the plants are obtained by default on interest and dividend obligations the properties will be rehabilitated in time and established, after financial readjustment, on a paying basis. The Third Avenue Railroad, as an independent company, will be more valuable to its owners and creditors than as an integral part of a great system. The expenditure of money upon improvements to track and new equipment will invite the return to all of the surface lines of some of the traffic which has been lost to competing subway and elevated lines. When it is possible to measure the extent of the increases in earnings from better service and changes in the transfer system, already made or planned, one of two steps will result—further segregation of individual properties or action looking toward final reorganization and restoration to security-holders.

Without considering the effect of partial disintegration and the consequent development of separate systems, Mr. Ivins, in the address referred to in the foregoing, estimated the replacement value of the surface system at $106,500,000, divided between $44,066,479 for 542 miles of track and $15,000,000 for rolling stock. He recast the statement of earnings for 1907 to show what the earnings would be on this estimated replacement cost if proper provision were made for maintenance and depreciation. With gross earnings and income from all sources of $21,919,692, of which $21,355,013 was derived from operation, Mr. Ivins allowed $13,172,571 for operating expenses, or 60.1 per cent. This he divided as follows: Transportation, $9,453,657; maintenance and repairs, $2,948,504; general and other expenses, $770,410. From the balance Mr. Ivins would deduct, say, 2½ per cent of gross income, for "adequate annual current maintenance" and $550,784 for an increase of, say, 10 per cent in wages. This deduction would leave a balance of $7,649,345. Allowing $3,000,000 for a depreciation reserve would leave a final balance for taxes, interest and dividends of $4,649,345. Computing taxes, exclusive of the special franchise tax, at $1,043,602 would leave for interest and dividends $3,605,743.

Mr. Ivins, however, is of the opinion that if the plant were placed in first-rate condition $1,500,000 would be ample for depreciation. With a saving in the cost of injuries and damages as a result of rehabilitated equipment, and possible increased earnings, Mr. Ivins figured an annual net divisible income of

$6,923,243, without any allowance for special franchise taxes.

These figures are of importance because of the broad powers conferred upon the commission with respect to capital issues. It is evident, however, that the figures of earnings, with normal conditions in business and traffic, would be enlarged considerably, both in gross and net, by even partial abolition of a too liberal transfer system.

ANNUAL REPORTS.

New Orleans Railway & Light Company.

While the operating expenses of all the properties operated by the New Orleans Railway & Light Company amounted to 54.1 per cent of gross revenue in 1907, the proportion of total revenue required for the expense of operation of the railway was 60.5 per cent. The report does not give any statistics which permit of analysis of the extent of the use of operating expenses for maintenance. The form of the report, however, is an improvement over that of the previous year, as it contains a balance sheet, a statement of securities owned and additional information concerning equipment. Earnings for three years compare as follows:

Revenue—	1907.	1906.	1905.
Railroad earnings	$3,987,733	$3,724,272	$3,291,961
Electric and gas earnings	1,893,686	1,875,400	1,705,807
Miscellaneous earnings	159,882	173,518	95,942
Total earnings	$6,041,301	$5,773,190	$5,093,710
Expenses—			
Railroad operating	$2,411,759	$2,225,580	$1,901,085
Electric and gas, operating	858,638	848,435	770,376
Total operating expenses	$3,270,397	$3,074,015	$2,671,460
Net earnings from operation	2,770,904	2,699,175	2,422,249
Interest on funded debt, taxes and miscellaneous	2,025,637	1,900,901	1,784,226
Net income	$ 745,267	$ 798,274	$ 638,023
Dividends on preferred stock	312,500	500,000	125,000
Surplus	$ 432,767	$ 298,274	$ 513,023
Operating expenses—percentage of gross revenue	54.1	53.2	52.2

The increase in gross earnings amounted to 4.6 per cent, and in operating expenses to 6.4 per cent. E. C. Foster, the president, states that most of the additional operating expense is due to the increased volume of business in the railway and gas departments and to an increase of 0.5 cent per hour in wages of employes from July 1.

Expenditures for construction, improvements, betterments and the acquisition of new property during the year amounted to $1,009,833, of which $598,498 was paid on account of power houses, which are now completed. The other expenditures, aggregating $411,335, were divided between the different subsidiary properties.

On account of the installation of sewerage and water mains by the city of New Orleans, about 25 miles of track have been undermined and thrown out of position by the building of parallel trenches close to the tracks, very much to their detriment. Mr. Foster states that it is the intention to expend, due partly to the installation of these sewerage and water pipes, about $500,000 for resurfacing and rehabilitation of track, as soon as it can consistently be done with due consideration for the company's interest.

The balance sheet as of December 31, 1907, shows "plant, property, franchise and securities" as $84,701,679. Gross revenue amounted to 7.1 per cent on this sum. The balance sheet also shows $85,686 stock and bond investment and $2,478,000 securities owned. Of the latter amount $2,390,000 of 4½ per cent general mortgage bonds and $5,000 of 6 per cent debenture notes are pledged as collateral for bills payable, which amounted to $1,777,588. Reserves for litigation, bad debts, etc., amounted to $73,243. The securities issued are as follows: Preferred stock, $10,000,000; common, $20,000,000; preferred stock affiliated companies, $7,100,000, of which $7,051,300 is owned by the parent company; common stock affiliated companies, $11,297,800, of which $11,028,000 is owned by the parent company; general mortgage bonds, $17,397,000; 6 per cent debenture notes, $1,300,000; funded debt of underlying companies, $12,902,000.

Traffic statistics compare as follows:

	1907.	1906.	1905.
Revenue passengers carried	78,879,204	73,606,068	65,021,214
Transfers redeemed	7,590,597	7,220,152	6,641,193
Revenue mileage	18,432,963	17,718,107	16,753,874
18-hour cars	113,648	108,637	102,156

The number of miles of single track is 194.68 and the total number of cars 578.

BOOK TABLE.

Development and Electrical Distribution of Water Power. By Lamar Lyndon. Published by John Wiley & Sons, New York, 1908. Book, 317 pp., 6 by 9 in., 158 figures. Price, $3.00, net.

While there are many well-written books on hydro-electric work and on high-tension electrical distribution methods, we do not know that the essential facts of interest to one engaged in the engineering work, which includes both fields, have before been jointly purchased. The present book is authoritative. It considers thoroughly without deep mathematical calculations the essential facts with which the engineer must be conversant if he has in charge the construction of a hydraulic plant whose product is electricity, which in turn is to be transmitted over a considerable distance. The first section of the book is devoted to hydraulics. Then follow discussions of electrical generators, transformers and transmission details. The third part of the book includes more than 150 well-illustrated pages exhibiting illustrated descriptions of recently built hydro-electric stations.

Telephone Construction, Installation, Wiring, Operation and Maintenance. By W. H. Radcliffe, E. E., and H. C. Cushing, Jr., E. E. Published by the Norman W. Henley Company, New York, 1908. Book, 4 by 6¾ in., 171 pp., 125 illustrations. Price, $1.00, net.

The authors in their preface to this book announce that it is intended for the amateur, the wireman or the engineer who desires to install a telephone for his own use, or for the contractor who desires to do this work for others. The reader need have no previous knowledge of the subject because all the steps are progressively described and no intricate mathematics are used in any computations. The book first describes the parts of a complete telephone equipment and then shows methods for installing the equipment so that it may best perform any particular service. Inspection and maintenance of instruments and lines, together with testing methods, are considered quite thoroughly for a book of this size.

Through Service Between Indianapolis and Louisville.

Through service between Indianapolis, Ind., and Louisville, Ky., will be started on May 1. The cars will operate over the lines of the Indianapolis Columbus & Southern Traction Company, the Indianapolis & Louisville Traction Company and the Louisville & Northern Railway & Lighting Company. Two trains will be run daily in each direction, leaving Louisville at 8:30 a. m. and 1:30 p. m., and reaching Indianapolis at 12:27 and 5:27 p. m., respectively, and leaving Indianapolis at 9 a. m. and 2 p. m., reaching Louisville at 1:04 and 6:04 p. m., respectively. Stops will be made at Jeffersonville, Watson Junction, Sellersburg, Scottsburg, Crothersville, Seymour, Columbus, Edinburg, Franklin and Greenwood, Ind. The distance between Indianapolis and Louisville is 117 miles and the fare will be $2.00 for a single trip or $3.65 for the round trip.

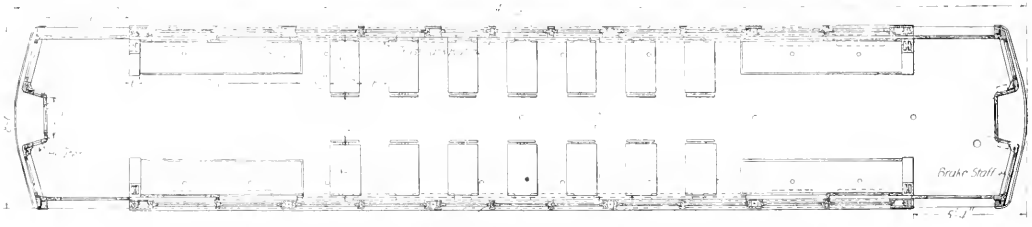
NORTHWESTERN ELEVATED RAILROAD—NEW TRAILER CARS, WITH STEEL UNDERFRAMES AND SLIDING SIDE DOORS.

To meet the rapidly increasing demands of its traffic the Northwestern Elevated Railroad, Chicago, has recently had built by the American Car & Foundry Company 10 trail cars. The design of the new cars is such that they can readily be converted into motor cars. The structural steel underframes have been designed with that end in view. Accompanying illustrations reproduced from working drawings and photographs serve to show the general appearance and some of the detail features of the new equipments.

Northwestern Elevated Cars—Side View, Showing Large Air Operated Doors.

The general dimensions of the new cars follow:

Distance between center of trucks	33 ft. 5 in.
Distance between centers of axles of trucks	6 ft.
Diameter of truck wheels	31 in.
Length of car body on center line over end plates	47 ft. 1⅜ in.
Extreme width over eaves	8 ft. 8½ in.



Northwestern Elevated Cars—Floor Plan, Showing Location of Walkover Seats.

Extreme width out to out sheathing at side sills	8 ft. 6 in.
Extreme width of dome over eaves	5 ft. 6½ in.
Radius of dome, outside	12 ft.
Width of portal opening	6 ft. 2 in.
Height of car floor over top of rail (light)	3 ft. 10⅜ in.
Height of center of drawbar over top of rail (light)	2 ft. 6 in.
Height of portal opening over inside floor	6 ft. 8 in.
Height of window sills over inside floor	2 ft. 7 in.
Width of sliding door opening	3 ft. 10 in.
Height of sliding door opening	6 ft. 5⅞ in.
Width of end door opening	1 ft. 11½ in.
Height of end door opening	6 ft. 5 in.

Framing.

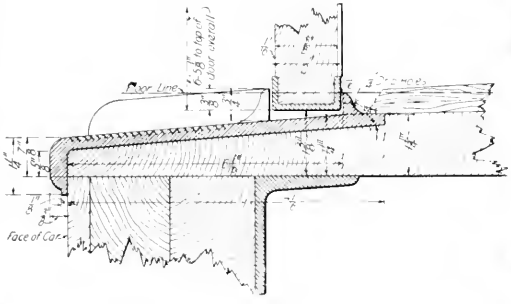
The underframing includes two longitudinal side sills and four intermediate longitudinal sills of 8-inch 11.25-pound channels, wood filled, extending the full length of the car and being continuous through the body bolsters with riveted connections to the end sill channels and plates. The cross members are 3-inch 4-pound channels secured by riveted connections. These cross channels are spaced about 48 inches apart. The end sills are formed of a bent 8-inch 11.25-pound channel iron with its edges turned in and mitered with the ends of the side sill channels. The sills are filled with yellow pine, except the end sills, which are filled with white oak.

The body bolsters are made of two 9 by ¾ inch soft steel plates. The top plate is secured to the intermediate sills by means of lugs and braces to avoid weakening the top flange of the longitudinal sills on which it rests. The ends of the top plate are turned down over side sills and riveted thereto. The bottom plate passes under the intermediate sills, which here perform the office of separators or posts and the ends of the plate are turned down on the inside face of the side sills, where they are secured to it by the same rivets that fasten the top plate. A cast-steel filler or separator is used at the center between the two central longitudinal sills. There are two needle beams of construction similar to that of the body bolsters.

Two thicknesses of 1 by 4 inch tongued and grooved long-leaf yellow pine are used for flooring. The bottom floor is laid at an angle of 45 degrees to the longitudinal axis of the car. The second yellow pine finish is laid in two ways, longitudinally with car under the seats and at right angles in the aisles. Between the under floor and finish floor there is a layer of hair felt uniformly ¼ inch thick squeezed down to ⅛ inch.

The end and portal posts are reinforced with angles bolted

to the underframing. On each side of the car between the corner posts there are four compound or panel posts and six single posts, the latter forming the mullions of the triple and double windows. The panel posts are made of two pieces of yellow pine finished 1¾ by 3⅝ inches and tenoned to the lower sills. The bracing is of the usual form with ⅝-inch tie rods. The outer sheathing is 2 by ½ inch white wood, tongued,

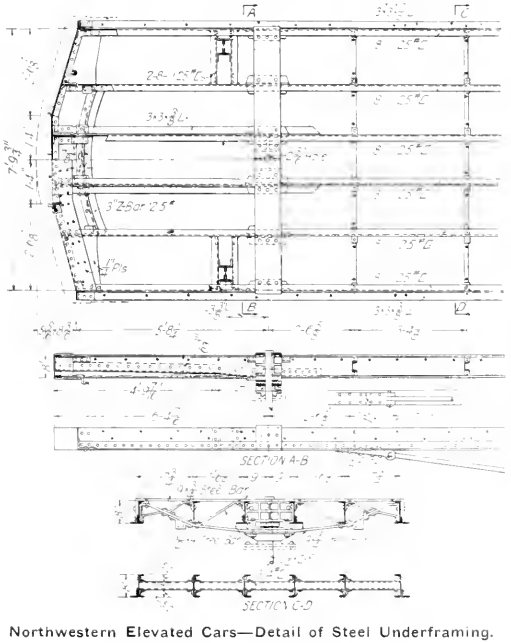


Northwestern Elevated Cars—Detail of Door Tread and Guide.

grooved and chamfered. The main carlines are built of 1¼ by ¼ inch wrought-iron bar, forged to the shape of the roof White ash is used for the intermediate carlines. Cotton duck and copper flashings cover the roof boards.

Detail Arrangements.

Each car has six doors, one at each end, to permit passage from car to car in a train, and two on each side. The end



Northwestern Elevated Cars—Detail of Steel Underframing.

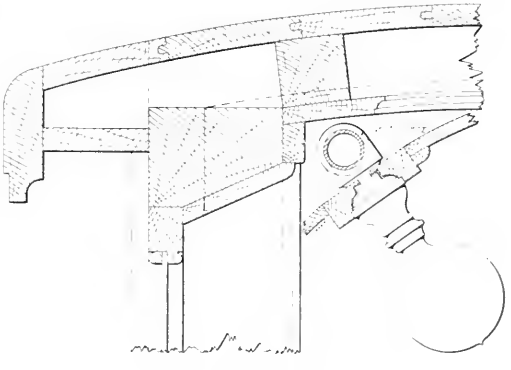
doors are so placed back of the end framing that ample space is afforded for a trainman to stand between cars and operate simultaneously the controlling handles of the air operated side doors. The end doors have sliding top sashes.

The side doors are especially wide (3 feet 10 inches) so that two persons may pass in or out at one time. They recede into pockets provided in the ends of the cars on either side. Illustrations are presented showing the door operating mechanism which is used to operate these large doors. J. E. Osmer,

Northwestern Elevated Cars—M. C. B. Truck with Cast-Steel Wheel Piece.

master mechanic, is the inventor of this mechanism. Briefly, the device comprises two opposing cylinders with piston heads on either end of a single piston rod. This rod moves back and forth along its line of travel according to the air pressure in the cylinders, which pressure is governed by a slide valve controlled from a handle at the end of the car. On the piston rod are teeth engaging a pinion carrying a long arm. As the piston is moved by air being thrown into one of the cylinders it turns the pinion, which, with its extension arm, in turn moves a connecting rod fastened to the sliding door. The door operating mechanism is fitted with dashpots so that the last four inches of its travel in either direction are covered at a slow speed. Accompanying engravings illustrate the general appearance of the pneumatic door operating device as it is installed behind the seat cushions in the car. An important feature of this device is that it executes two movements of the door, that is, an opening and later a closing movement, with but one charge of air.

As shown in the illustration there are 11 windows along



Northwestern Elevated Cars—Section Through Deck, Showing Lamp Fastenings.

each side of the car. The upper sashes raise into pockets and the bottom sashes lower and are covered. The deck sashes are glazed with wire glass and alternately are hinged to swing open. An operating arm and rod on the inside of the car is so connected that one set of deck sashes can be

opened and the other closed by one movement of the operating handle. The inside finish, where exposed to view, except the head linings, is selected mahogany. Below the windows the sheathing is mahogany, ½ inch thick, fastened with brass screws. The head linings are of 3-ply maple. The ceiling in the vestibule is covered with 2 by 2½ inch white maple.

The seating arrangement is novel for elevated service. At the ends of the cars are longitudinal seats supported on malleable iron brackets and in the center of the car body on each side are seven Hale & Kilburn walkover cross seats without arm rests. The steel frame of each cross seat is supported on a single pedestal. All seats are covered with rattan. Hunter destination signs in neat compartments are fitted to each car.

The new cars have drawbars and draft rigging conforming to the standards of the Northwestern Elevated Company. The coupling heads are of the S. & W. type. An accompanying illustration shows the type of truck which has been developed in the company's shops and is being used for mounting the 40 new bodies. These trucks were built by the American Car & Foundry Company. The cars are equipped with Westinghouse automatic quick-action air brakes, schedule A M R, with type R-1 triple valves, 10 by 12 inch cylinders, 10 by 24 inch auxiliary reservoirs and American Brake Company's automatic slack adjusters. The air piping, together with the electrical train lines which are carried in loricated conduit, is brought out at the ends of the cars and by means of swivel joints is arranged to swing with the coupling heads, so that very short coupling hose and jumpers are required.

Each car is wired with five circuits of five lights each, four of these circuits being 16-candlepower 110-volt lamps with round frosted bulbs located in the molding over the advertising card space. One circuit has three 32-candlepower "Meridian" lamps without reflectors located along the ceiling of the car and two unfrosted 32-candlepower lamps in the vestibules. The wiring for the lighting has been installed with especial care. An accompanying sketch shows in detail how the lamp sockets along the molding are connected with the conduit inside the lining. Each car is equipped with 28 Consolidated Car-Heating Company's heaters, 12 located on each side along the base board and two in each vestibule located on each side of the end door. All the heaters have double coils for three regulations of heat. The main switches for the lighting and heating circuits are inclosed in a neat fireproof panel box recessed in the side of the portal at the end of the car.

These new cars will be put into service on the new Evanston extension of the Northwestern Elevated, which is fast nearing completion.

ANNUAL MEETING IOWA STREET AND INTERURBAN RAILWAY ASSOCIATION.

The fifth annual convention of the Iowa Street and Interurban Railway Association was held on Thursday and Friday of this week, April 23 and 24, at Des Moines, Ia. F. J. Hanlon, Mason City, president of the association, presided.

At the opening session the association was welcomed by the mayor of Des Moines, A. J. Mathes. C. E. Walters, Toledo, Ia., responded, complimenting the city of Des Moines on its being served by so excellent a system of street and interurban railways and paying a kindly tribute to the late J. S. Polk, through whose insight, ability and energy the railway systems at Des Moines were brought to their present state of excellence.

L. D. Mathes, general manager Union Electric Company, Dubuque, presented his annual reports as secretary and treasurer of the association.

A paper entitled "Reinforced Concrete in Electric Railway Construction" was read by N. M. Stark, constructing engineer, Des Moines. This paper will be found elsewhere in this issue.

In the discussion which followed the reading of the paper, Mr. Stark stated that the difference in cost between that for a steel bridge with concrete substructures and that for a structure of reinforced concrete alone was about 12 per cent. He highly favored the horse-shoe-shaped arch for small waterways through track embankments. These arches, as described in the paper, are built without wing walls. This feature of construction frequently makes it possible to erect such a culvert at a cost 15 per cent below that for the ordinary type of concrete culvert having wing walls.

W. A. Williamson demonstrated the merits and methods of using the Rooke automatic fare collector, which, as recently announced in the Electric Railway Review, is now being used on the lines of the Des Moines City Railway.

P. P. Crafts, President-Elect.

Resolutions were passed by the association favoring the choice of Denver by the American Street and Interurban Railway Association as the convention city for its next annual meeting.

Thursday Afternoon Session.

Daniel Royse, assistant editor-in-chief The Railway Age, Chicago, presented in abstract a paper entitled "Depreciation in Electric Railway Accounting," which will be found elsewhere in this issue.

The paper was discussed at considerable length, the sentiments expressed being in harmony with the conclusions of the author. Especial emphasis was laid on the desirability of providing for depreciation in order to protect the manager from the importunities of his stockholders, who too often think that any money remaining after the payment of operating expenses and fixed charges should be distributed in dividends.

Messrs. Crafts, Polk and Mathes were appointed as a committee to draft a resolution expressing the sense of the association in regard to accounting for depreciation.

Arthur W. Gross, claim agent Omaha & Council Bluffs Street Railway Company, presented a paper on claims, which is published elsewhere in this issue.

In the discussion which followed the reading of his paper Mr. Gross told of the highly satisfactory results which are obtained at Omaha by the use of mirrors on cars. These enable the motormen to see what is going on along the sides of their cars without turning their heads. The use of the mirrors has assisted materially in the prevention of accidents. They are installed on all closed cars and also soon will be placed on the open cars so that the motormen can easily watch the running board. The best methods of utilizing the services of local and company physicians and surgeons were discussed. Mr. Gross also suggested that it would undoubtedly be a very satisfactory accident report detail if a witness were requested to write in his own handwriting over his signature a statement somewhat as follows: "I have carefully read the foregoing statement and have found it to be true and complete."

At the close of the afternoon session the supply men's exhibits were inspected. There were present at the convention 125 representatives of manufacturers whose products are sold to electric railways. About 25 supply houses exhibited apparatus and material. The exhibits were very numerous for a state association meeting.

Through the courtesy of the local railway and lighting companies the railway and supply men attending the convention were entertained at a theater party Thursday evening.

Friday Morning Session.

At the meeting on Friday morning a general discussion was held on the subject of "Advertising by Electric Railways," in which many members participated.

P. P. Crafts, general manager of the Iowa & Illinois Railway, Clinton, then read a paper on "Handling Fares on Interurban Railways," which appears elsewhere. This paper was discussed at considerable length.

C. L. Wight, auditor Inter-Urban Railway, Des Moines, read a paper on "Interstate Commerce Commission—Statistics and Accounts," which appears elsewhere.

The following officers were elected for the ensuing year:

President—P. P. Crafts, general manager Iowa & Illinois Railway, Clinton, Ia.

Vice-President—R. A. Leussler, secretary and assistant manager Omaha & Council Bluffs Street Railway, Omaha, Neb.

Secretary-Treasurer—L. D. Mathes, manager Union Electric Company, Dubuque, Ia.

P. P. Crafts, the new president of the association, is

general manager of the Iowa & Illinois Railway at Clinton, Ia., and for the past year has been vice-president of the Iowa Street and Interurban Railway Association. Mr. Crafts has been connected with the street and interurban railways in the middle west for the past seven years, having spent a part of that time with the Saginaw, Mich., properties and the remainder with the Iowa & Illinois Railway operating between Clinton and Davenport, Ia. Last September he was appointed general manager of the Joplin & Pittsburg Railway under construction from Pittsburg, Kan., to Joplin, Mo., retaining at the same time the management of the Iowa & Illinois lines. As announced in the Electric Railway Review of last week, however, he has relinquished these duties in favor of R. W. Harris and henceforth will confine his attention to the management of the Iowa & Illinois road alone. Before coming west Mr. Crafts was associated with Stone & Webster of Boston, Mass., in various positions connected with the engineering and management of their properties.

The next annual meeting will be held the third Thursday in April, 1909, at Cedar Rapids, Ia.

IOWA ELECTRICAL ASSOCIATION.

The eighth annual meeting of the Iowa Electrical Association was held at the Savery hotel, Des Moines, Ia., on April 22 and 23, President George S. Carson of Iowa City presiding.

The programme included the following:

"Popularizing the Use of Electricity," E. L. Callahan, Chicago.

"Fraternalism," Gus Lundgren, Cherokee, Ia.

"Tact and System," J. W. Ferguson, Commonwealth Edison Company, Chicago.

"Economical Operation of a 200-Kilowatt Station (Features of Indicating Devices)," Austin Burt, Waterloo, Ia.

"Grounded Secondaries," Thomas Sloss, Cedar Rapids, Ia.

Short talks on "Best Ways to Meet Gas and Gasoline Competition," Gus Lundgren, Cherokee, Ia., and M. A. Harrison, Nevada, Ia.

"Incandescent Lamp Development," F. W. Wilcox, Harrison, N. J.

"Electric Motor Characteristics," Prof. A. H. Ford, State University of Iowa.

"The Freight Question," E. G. Wylie, Des Moines, Ia.

Short talks on "New Business Methods" by L. D. Mathes, Dubuque; J. F. Porter, Davenport; E. L. Kirk, Sioux City; A. L. Dodd, Charles City; J. P. Walters, Toledo; C. O. Ingersoll, Marion.

Fitchburg & Leominster Street Railway Relief Association.

The Fitchburg & Leominster Street Railway Relief Association was organized on September 1, 1895, by the employes of the Fitchburg & Leominster Street Railway, Fitchburg, Mass. The idea originated with Robert N. Wallis, who was then and is now the treasurer of the railway, and Martin F. Farrell, one of the oldest employes of the company. F. P. Greene was the first president of the society and Mr. Wallis has been the treasurer since the office was created. The organization is governed by employes and the company never has had to assist it financially, although individual members of the board of directors make annual contributions to the treasury. The dues were fixed in the beginning at 50 cents per month and have remained at that figure, with the option that a second monthly assessment could be levied at any time the funds on hand amounted to $100 or less. It has been necessary to make a second assessment in but one month. Ten dollars per week benefit is paid for a period not exceeding five weeks for the same sickness or injury, with the exception that only $5.00 is paid for a single week's disability. At the present time the membership comprises two-thirds of the employes and there is a surplus of about $1,300. About $6,000 has been disbursed since the association was organized.

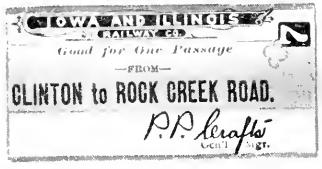
Edward N. Bassett of the New York public service commission recently stated that more tunnels were needed under the East river between New York and Brooklyn and that more rapid transit lines should lead to the suburbs.

HANDLING FARES ON INTERURBAN RAILWAYS.*

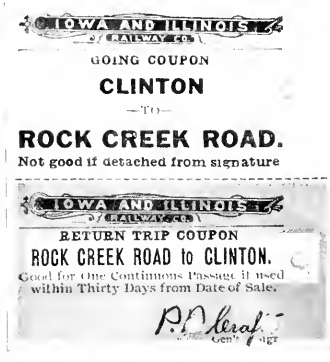
BY P. P. CRAFTS, GENERAL MANAGER IOWA & ILLINOIS RAILWAY COMPANY.

Probably the question of proper collection, registration and auditing of interurban fares has received more attention from interurban managers than any other individual item in connection with their work.

It is fully as important to safeguard the receipts against loss through careless and inefficient methods of handling and accounting and the peculations of the dishonest employe and passenger as to properly account for the operating expenses, if not more so.



Iowa & Illinois Railway—Single-Trip Regular Rate Office Ticket (Full Size).



Iowa & Illinois Railway—Round-Trip Regular Rate Office Ticket (Full Size).

Too many of us look upon the money obtained from traffic as so much cash received, and do not give sufficient thought to analyzing and preventing the small leaks, which, taken individually, may be very small, but taken collectively amount to a good round sum each year. Such money is earned, yet neither collected nor accounted for.

For instance, a 3-car road, operating 12 trips per car per day of 18 hours, and losing only 10 cents per trip, will in one year be short $1,314. One-half this amount expended in clerk hire or in proper ticket forms might be the means of saving such a loss. On the other hand, some managers surround the handling and accounting of fares with so many safeguards that their expenses are enormous in proportion to the benefits derived.

The Important Question.

The question, therefore, resolves itself down to "What is the simplest system of accounting and tickets which, with the least expense, will transfer the greatest percentage of money due from traffic to the treasury of the company?"

The answer is not nearly so simple as perhaps it may seem, because local conditions of traffic, number of stops, terminal arrangements, etc., must govern the system finally adopted.

A road whose stops are far apart and which carries mostly through traffic, i. e., from one terminal to the other, may successfully adopt a system of collection and registration which would utterly fail of its purpose on a road whose stops were frequent and the local or short riding heavy. In other words, the fares lost from not being collected, on the latter line, because of a very accurate but cumbersome system of fare collection and registration, would be greater than the losses which might be sustained by the use of a somewhat less accurate system permitting quicker work on the part of the conductor.

This assertion, it must be admitted, is a very strong one, but the writer has, for several months past, operated two interurban lines, one of which presents the former condition, and one the latter. The opportunity to study both conditions has therefore been an excellent one and the experience gained of sufficient value to make the above statement.

*A paper presented at the meeting of the Iowa Street and Interurban Railway Association, Des Moines, Ia., April 23 and 24, 1908.

A number of so-called standard systems have been devised from time to time, some of which have been guaranteed by the originators to cure all evils in the line of fare collection, etc., but local conditions were not given sufficient consideration, with the result that some of these systems have been adopted by some roads and some by others, but none of them has been sufficiently universal to be applied to all conditions.

Systems of Fare Collection.

The most universally used systems at present are as follows:

1. The duplex check used in various forms and in various manners.

2. A combination of the duplex check, sold only on cars, and tickets sold only in stations.

3. The use of registers upon which can be recorded the various classes of fares collected.

4. The zone system of fare collection by which fares are collected every few miles and recorded on ordinary registers.

Various other systems are in use, but the above described will be found on the greater majority of the electric lines in this country.

Probably all the different forms of the duplex check, under that and other names, have been called to the attention of all interurban managers, therefore I will not take the time to describe them in this paper, but the variety of combinations of their use are worthy of description and discussion. The general combinations are:

A. One form of duplex check for 1-way fares, with and without registers.

B. One form of duplex check for both single and round trip fares, with and without registers.

C. Two forms of duplex check, one for single and one for round trip fares, in either direction, with and without registers.

D. Four forms of duplex check, one for single and one for round trip fares in one direction; one for single and one for round trip fares in the opposite direction.

E. In addition to any of the above combinations forms

Iowa & Illinois Railway—Northbound Round-Trip Regular Rate Duplex Check Sold on Southbound Cars (Original 4⅞ by 4½ Inches, Unfolded).

for special reduced rates, generally used on certain days only.

With any form of the duplex check a very careful record must be maintained of the checks issued to the conductors, and the number reported daily by them as used, and the checks turned in by all conductors, whether issued by the man turning in or by some other man.

One of the most valuable assistants in checking the issuing and collecting of checks is a comprehensive trip sheet which will not require that the conductor be a bookkeeper, but upon which he can properly classify the fares collected in an intelligent manner. In this connection some roads allow each conductor to use one trip sheet for the entire day, while others require a trip sheet to be turned in at the end of each swing or at the end of each trip. The necessity of either of the latter arrangements varies with conditions, but in general, and for reasons only too obvious to all managers, it is desirable to have trip sheets made up and handed in at the end of each round trip. Tickets collected should also be handed in with the trip sheets upon which they have been recorded.

Descriptions of Methods Used.

To illustrate the point brought out earlier in this paper, the writer will describe the system of fare collection and accounting in use upon each of the roads which he has managed for some time past, namely the Iowa & Illinois Railway and the Joplin & Pittsburg Railway, the former illustrating the first and the latter the second class mentioned.

On the Iowa & Illinois Railway a combination system is used consisting of duplex checks sold only on cars, card tickets and mileage books sold at the terminal offices, together with special rate duplex checks sold on cars and special rate tickets sold in offices mentioned, the latter only for special rate days and for special car parties.

Of the regular rate tickets issued there are four forms of duplex checks, sold only on cars, one single-trip and one round-trip form for each direction. Four forms of terminal office tickets are also sold, one single-trip and one round-trip form for each terminal.

In addition a color scheme is also carried out, all tickets having colored panels printed upon them. Tickets which can be collected on southbound cars bear blue panels and those collected on northbound bear red panels.

It is therefore necessary for conductors to change their pads of tickets at the end of each half trip, and in order that they may have a sufficient supply on hand for all emergencies each conductor is provided with a small tin box having a proper lock, in which he can keep all tickets not actually in use.

Round-trip tickets are so arranged that the return coupon bears the proper color of panel for the return trip. The conductor of a southbound car sells a round-trip ticket having a red panel on the return coupon, retaining the plain going coupon. The same color scheme applies to office tickets sold at terminals.

Regular rate tickets are never sold at a reduced rate, a special form being provided for that purpose. These special rate tickets are easily distinguished from the regular rate tickets both by form and color. Therefore, if conductors receive orders to sell at reduced rate between any two points they must use the special rate form of check. Inasmuch as the terminal offices only sell reduced rate tickets between terminals, or between either terminal and the Iowa & Illinois park, only two forms of special rate tickets are sold at each of the offices mentioned. Special rates are never made for a ride in one direction only.

In addition to a fairly comprehensive system of tickets conductors must close trip sheets and turn them in, together with all tickets collected, at the end of each round trip. This, of course, materially increases the work of auditing tickets, but it decreases the possibility of the double use of ticket stubs, against which the company is again partially protected by the consecutive numbering of each form of ticket, which also includes a letter designating whether the ticket is southbound or northbound.

We also make use of a register, but its purpose is not to register the amounts of fare paid by passengers nor to check the number of passengers on the car at any one time, except when going into or going out of the city of Davenport. This is done to comply with the terms of a terminal contract with the Tri-City Railway Company.

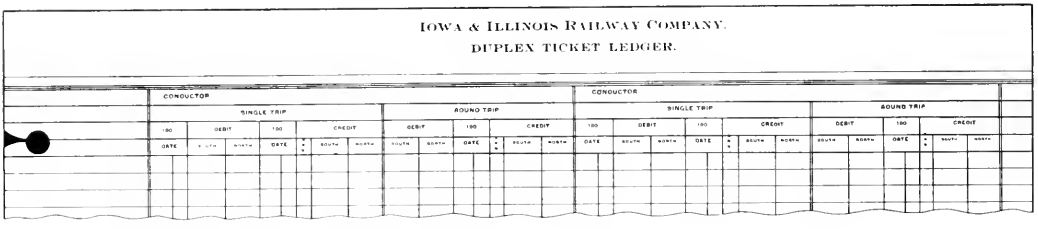
A daily check is kept of all tickets of different classes sold by each conductor and by each terminal office. When a conductor receives a pad of tickets he is charged with it by the beginning number. After checking through his trip sheets from the beginning to the end of his run, to ascertain whether or not the numbers of all tickets sold check with the closing number as reported at the end of the day, the closing number is entered on the ticket ledger and this number is, of course, the opening number for the following day. This same method is carried out in accounting for tickets sold by the terminal offices. When transferring tickets from the stock room to the distribution drawer care is taken that consecutive numbers are transferred and in no case are pads of tickets bearing anything but the proper numbers allowed to be issued to the conductors or to the offices.

We find it is a very easy matter to check irregularities or losses on the part of conductors or agents and to trace out any tickets presented for redemption. It is very surprising to some person demanding a return of his fare on some excuse, when, after asking a few questions, we ascertain that perhaps the party had picked up a receipt in a car leaving Clinton at 5:30 p. m., which receipt was left in the same car by some party riding on its 2:30 p. m. trip.

When the road was first started we had a large number

of these demands, but it is now a rare thing to have a demand for a return of fare except in cases where people buying round-trip tickets have been unable to use them, in which case we immediately return the difference between the regular trip fare and the round-trip fare paid.

The system of using colored panels so materially reduces the chance of the double use of receipt stubs that we have never been able so far to find any evidence of such double use. This can be very readily seen when it is explained that after once selling a duplex check from one station it is impossible for the receipt stub to be again used from the same station, because the conductor's stub is recorded and turned in before he again passes that station in the same direction. Furthermore, each conductor, knowing that the serial numbers of all tickets issued to him are recorded, is extremely careful about selling any which do not bear the proper number.

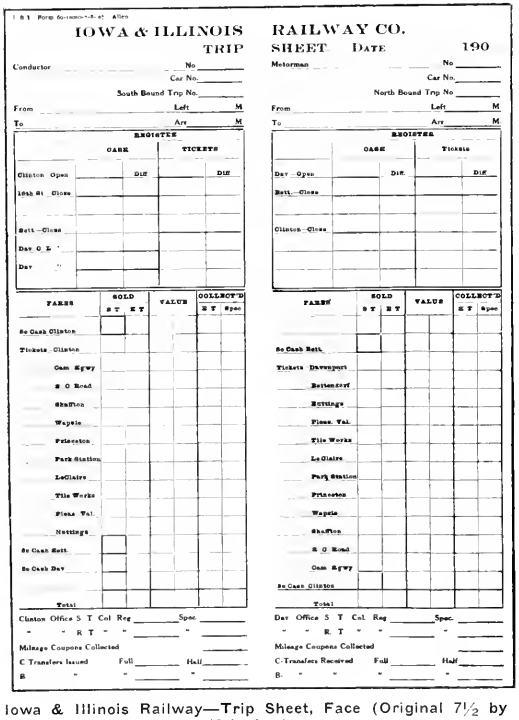


Iowa & Illinois Railway—Page Heading from Duplex Ticket Ledger (Original 16 by 11¼ Inches).

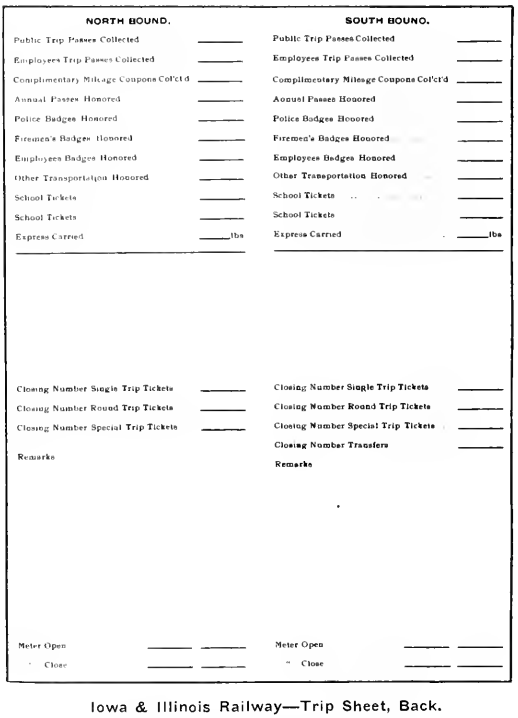
business derived at the various flag stations along the line, preferring to divide it between through and local business. From these records it is very easy to ascertain whether or not the traffic from any one particular point is falling off or increasing materially. We are very careful, however, to separate northbound from southbound traffic, in order that we may ascertain whether or not the line is being used as a connecting link by traveling men in one general direction.

Under the contract with the Tri-City Railway Company it is necessary for us to report the number of passengers going in and coming out of the city and the number of transfers issued and received. Proper spaces are provided on trip sheets for filling out these reports, the figures being carefully transferred to a record sheet and reported monthly to the terminal company.

Having described the system in use on a road with stops averaging one about every three miles, I shall now illustrate that such a system is not at all practicable for a road whose stops average about one for each half mile, by describing the system in use on the Joplin & Pittsburg Railway.



Iowa & Illinois Railway—Trip Sheet, Face (Original 7½ by 10 Inches).



Iowa & Illinois Railway—Trip Sheet, Back.

Joplin & Pittsburg System.

This road operates through a number of small mining towns radiating out from Pittsburg, Kan. The local traffic

between the various towns and the morning and night traffic between the homes of the miners and their work is extremely heavy. To better illustrate the amount of local riding, I will state that the average fare per revenue passenger on this road is approximately 7½ cents in a maximum fare of 35 cents, without round trips or special rates, whereas on the Iowa & Illinois Railway the average fare per revenue passenger is 32 cents in a maximum fare of 70 cents, besides round trips, mileages and special rates, the latter being frequently given.

The situation on the Joplin & Pittsburg Railway was studied very carefully and it was soon ascertained that the use of a very comprehensive ticket system would defeat its purpose, because so many fares would be missed owing to the extremely large number of local passengers handled.

A system of registration by which all classes of fares could be rung up and recorded was finally adopted, hat checks being issued to designate passengers traveling between the principal stations. This system, however, has its disadvantages, because the conductor is comparatively free to ring up any amount of fare, regardless of what he collects.

This may seem like a very bold statement, but the writer has made a special study to ascertain whether or not passengers pay any particular attention to the registration of fares, and he is satisfied that a great majority pay no attention to it whatever. Even should they notice the ringing of the bell, it is very unlikely that they would pay any attention to the actual amount indicated on the face of the register. The average conductor also realizes this inattention on the part of the passengers, and it is, therefore, an easy matter for one so inclined to pick up enough daily, as I have heard it whispered around street corners, for lunches, cigars and drinks.

It is also very hard, when using this system, to check conductors who are inclined to be dishonest, for unless the checker can actually see the amount paid it is difficult for him to state positively that the conductor had "rung short."

The peculation of the dishonest conductor is, of course, limited to a certain extent, because he must keep a very accurate account of the number and amount of fares rung short, or his check with the register will be incorrect to such an extent that he lays himself open to suspicion at the office. He can determine in advance just how much he will take up on each trip and unless he becomes greedy enough to take a large amount or is caught by an inspector, he can make some pocket money.

The system of hat checks recently designed by Mr. Pierce of the East St. Louis & Suburban obviates this trouble to a certain extent, but it again introduces a considerable loss of time in the collection of fares.

One method which would partially overcome the difficulty referred to would be to use an ordinary fare register, registering by 5-cent fares. If a passenger paid 25 cents the register would be rung five times. This method, however, destroys the means of keeping account of passengers carried.

Another partial cure is the zone system, but the writer's experience with that system has been very unsatisfactory. The zone system as a general proposition causes the passengers too much annoyance and the earnings of the road must suffer in consequence. Some managers claim to have overcome the objection to it by collecting full fare and requiring the conductor to ring up for each passenger carried in each zone. Assuming a car carrying over 200 people in a trip of 22 miles, the passengers would not be able to carry on much conversation and would hear very little else than the ringing of the fare register. This system, unless used in combination with duplex checks, also prevents an accurate accounting of passengers carried. The accounting for fares collected on the Joplin & Pittsburg Railway is naturally a simple matter, as, there being no round-trip or special rates, fares between any two points on the road remain the same. It is only necessary to check trip sheets with the registers and with cash turned in by the conductors. From the trip sheets also is obtained the number of passengers carried and the car mileage.

Conclusions.

In conclusion I believe it is conceded that the use of the duplex checks on roads whose short riding traffic is normal is practically a success, but a satisfactory system has not been discovered for roads carrying a large proportion of local traffic. There is great room for improvement in the latter instance.

One of the most important features in connection with any system of fare collection and accounting is to keep a careful record of tickets issued to conductors and offices, to have the conductors turn in frequently enough to prevent the double use of duplex checks and to carefully audit the returns of conductors and offices. It is extremely important, of course, that the latter item shall be followed up efficiently, otherwise mis-

takes will occur in the auditing department in connection with the correcting of conductors' mistakes, which will not only be embarrassing, but will destroy the efficiency of the auditing system. Under no condition should the handling of fares and tickets be allowed to drag in any department, because upon the efficiency of the system of accounting for receipts depends the efficiency of other departments, whose standard is set by the former.

The new line of the Connecticut Company, New Haven, Conn., between Rockville and Stafford Springs, Conn., was opened for traffic on Monday of this week. The line is 12.9 miles long and affords through service from Hartford to Stafford Springs. The running time from Rockville to Stafford Springs will be 45 minutes and from Hartford to Stafford Springs 1 hour and 45 minutes. Cars will run every hour. Power for the operation of the extension is secured from the Hartford Electric Light Company through a transformer substation in Rockville.

A 4-car elevated train of the Brooklyn Rapid Transit Company collided with a surface car at Eighteenth avenue and Eighty-sixth street, Bath Beach, on April 20, at a point where the elevated cars run on the surface and cross the tracks of the Coney Island and Thirty-ninth street line. Thirteen passengers were injured and traffic was delayed for several hours. Both cars were running slowly. It is stated that the cause of the accident was a misunderstanding of signals by a new motorman on the surface car.

DEPRECIATION IN ELECTRIC RAILWAY ACCOUNTING.*

BY DANIEL ROYSE, ASSISTANT EDITOR IN CHIEF, THE RAILWAY AGE.

Electric railways comprise an important part of the transportation industry of the country and are founded upon an enduring need. Therefore their securities should be among the most desirable of investments, considering both safety and income, but even in the largest centers of population, where the need of transportation is greatest and large earnings most certain, electric railway securities have in the past proved to be most precarious—not only as to earnings, but as to safety of capital—to illustrate which it is only necessary to refer to recent history in Chicago and New York.

This anomalous condition exists because for years the electric railway was on a promotion basis and was made to yield big returns to a few—it being made to appear that these returns came out of the earnings, when really they were in large part improper diversions of the capital of many innocent investors in both stocks and bonds. The practice of dissipating capital in the guise of dividends was possible because the matter of providing for the renewal of the physical property was ignored until the need of renewal was imminent, and then the simple device of a reorganization or a sale or lease to a new company afforded opportunity for charging the cost of rebuilding to capital account. In some cases corporation was thus piled upon corporation until the outstanding capital obligations amounted to ten or more times the annual gross earnings—in practice, apparently, the only limit was the capacity of the bond market to assimilate securities.

The fact that "Depreciation" is one of the subjects on the programme for this meeting of the Iowa Street and Interurban Railway Association is an indication not only that the members of the association recognize that depreciation of the physical property of electric railways does occur, but also that they wish to consider the extent to which it is desirable to make present provision for the demand which the future will bring.

Neglecting Depreciation.

Heretofore recognition of depreciation and of the accrued liability resulting from it seldom has been given except when trying to convince the tax assessor that the property was not nearly as valuable as the reports of net earnings seemed to indicate, or when endeavoring to demonstrate that the books of some plant owned or operated by a municipality were not properly kept. Now, however, principally because of the activity of the interstate commerce commission and of the state railway commissions, which promise to co-operate with the national body, conditions are changed, and it is the part of wisdom, and of expediency as well, to meet the new conditions squarely and work in harmony with these regulating bodies.

The most serious effect of the mistaken theory heretofore so generally followed by electric railways is not the deceiving of investors, though in some cases the result to them has been sufficiently disastrous, but the misinforming of the public. Taught to believe that electric railways are cheap to operate and yield large returns to the owners, the public naturally has demanded that fares be reduced, that compensation for franchise grants be paid, that more extended transfer privileges be given, that the streets be paved, cleaned and lighted by the railways operating in them, etc. Moreover, it is believed that the growth of the idea that franchise grants should be strictly limited to a short term is for the most part due to this same misapprehension on the part of the public for which the railways are directly responsible.

In considering what present provision for future demands it is desirable or necessary to make railways should be classified according to the length of time their franchise grants run. Depreciation applies to all railways, but plans for the amortization or retirement of the capital need be made only by those companies having short-term franchises.

Extent of Deterioration.

Depreciation is that deterioration of the physical property which is not made good by current repairs. For example, a car, though kept in the best of repair, eventually will have to be taken out of service and replaced. If the term of service be 20 years it is evident that the car each year has depreciated in value to the extent of 5 per cent of the difference between its original cost and its value as scrap. Assuming a scrap value of 20 per cent of the original cost, there will be a depreciation of 4 per cent per annum on the car. If no provision has been made for this current depreciation, when the time comes for replacing the car it will be necessary to charge the 80 per cent of the cost of the old car to operating expenses if the capital is to remain unimpaired.

This in general has for many years been the practice of the steam railways, and is that prescribed in the "Standard Classification of Operating Expenses" adopted in 1898 by the Street Railway Accountants' Association. There is, however, much reason to believe that electric railways have too often charged renewals to "Construction" or "Reconstruction," instead of to operating expenses under the head of "Maintenance," as the standard requires.

But even if the injunction to include in maintenance "all expenditures for repairs and renewals" be strictly observed, there will be a gradual reduction in the value of the physical property subject to depreciation that will finally amount to between 40 and 50 per cent of the original cost of that property. To illustrate: Railways develop gradually and their equipment is acquired from time to time as the need arises. Now, take 20 cars, purchased one each year, the oldest having been in service 19½ years, another 18½ years, and so on down to the newest, which is ½ year old. The life of cars being taken at 20 years, the total car-years of service yet before these 20 cars is 200, or an average of 10 years per car. With salvage at 20 per cent of the cost the average depreciation of the cars is $\frac{1}{2}(100-20)=40$ per cent of the cost.

The same reasoning applied to other classes of equipment will give similar results, varying a little according as the scrap value is greater or less than 20 per cent. When a group of units, such as the cars in the example cited, varying in age by equal increments is considered the life assumed does not affect the average depreciation, it being always one-half of the total life if the computation be made midway between the regular renewal dates. Hence the conclusion that when proper renewals are made the normal value for service of the physical property of a railway after a sufficient period of operation is only from 50 to 60 per cent of its original cost.

Tentative Plan of Interstate Commerce Commission.

In Accounting Series Circular No. 20, dated January 10, 1908, Prof. Henry C. Adams, in charge of statistics and accounts for the interstate commerce commission, submitted tentative classifications for the operating expense accounts of electric railways engaged in interstate commerce, which classifications contain provisions for depreciation accounts as follows:

A. Under the head of "Depreciation Estimate—Revenue Equipment," in "Maintenance of Equipment," there are provided eight accounts for cars and locomotives, and under "Depreciation Estimate—Service Equipment," in "Maintenance of Way and Structures," three accounts. Each of these 11 accounts is designated "Depreciation Estimate" and is subdivided into two subaccounts designated as "Estimate" and "Renewals," respectively. The instructions as to what are included in the subaccounts, taking "Passenger Cars" as an example, read as follows:

"a-1. Passenger Cars—Estimate.

"This account includes a monthly charge of one-twelfth ($\frac{1}{12}$) of .... per cent per annum of the original cost (estimated, if not known) of passenger cars, to provide a fund for replacement when retired.

"Note.—Where, in the opinion of the carrier company, depreciation can be more accurately estimated by basing the estimate upon the service rendered by the property, such method of estimate may be permitted, in case the carrier company first files with the ..... commission a statement of the rule or principle upon which it will base its estimates of depreciation, subject to disapproval by the commission.

"a-2. Passenger Cars—Renewals.

"This account includes the original cost (estimated, if not known) of all passenger cars condemned, destroyed or sold, less:

"Amount previously charged for depreciation up to date of retirement; plus

"Scrap value of salvage or the amount received from sale of passenger cars retired.

"Note A.—Passenger cars permanently retired from service, but held, pending disposition, should be written out of service through this account, and carried in an appropriate material account at a nominal valuation or at actual scrap value, if determinable.

"Note B.—The appropriate charge to this account, in respect to equipment in service on (a fixed date, as, July 1, 1908), will be determined by deducting from its depreciated value on that date the amount charged for depreciation accruing subsequently to (June 30, 1908), up to the date of retirement, and the scrap value of salvage or the amount received from sale of such equipment retired. The depreciation accruing before (a fixed date, as, July 1, 1908) must not be

*A paper presented at the meeting of the Iowa Street and Interurban Railway Association, Des Moines, Ia., April 23 and 24, 1908.

charged to the operating expenses of any part of the period subsequent to (June 30, 1908). The purpose of the instructions in this note is to prevent any charge against Renewals Account for depreciation accruing previously to the setting up of regular depreciation charges under this classification, and, inasmuch as such previously accrued depreciation is not an item of current operating expenses, it should be adjusted by appropriate entries in the general books."

B. Under the head of "Depreciation Estimate—Maintenance of Shop and Power Apparatus," in "Maintenance of Equipment," there are provided three accounts, each subdivided into two, with designations and instructions, taking "Shop Machinery and Tools" as an example, as follows:

"(a) Depreciation Estimate.—'Shop Machinery and Tools.'

"a-1. Shop Machinery and Tools—Estimate.

"This account includes a monthly charge of one-twelfth of .... per cent per annum of the original cost (estimated, if not known) of shop machinery and tools in service to provide a fund for replacement when retired.

"a-2. Shop Machinery and Tools—Adjustment.

"This account includes the original cost (estimated, if not known) of all shop machinery and tools prematurely condemned, destroyed, sold or otherwise removed from service, less the amount previously charged for depreciation up to date of retirement and salvage recovered from final disposition."

C. Under the heads of "Depreciation Estimate, ...," in "Maintenance of Way and Structures," there are provided 25 accounts, each subdivided into two, with designations and instructions, taking "Rails" as an example, as follows:

"b-1. Rails—Estimate.

"This account includes a monthly charge of one-twelfth of .... per cent per annum of the original cost (estimated, if not known) of rails in service to provide a fund for replacement when retired.

"b-2. Rails—Adjustment.

"This account includes the original cost (estimated, if not known) of all rails prematurely condemned, destroyed, sold or otherwise removed from service, less the amount previously charged for depreciation up to date of retirement and salvage recovered from final disposition."

Of these three groups two, B and C, it is stated, have been included only for the convenience of those desiring to use them and are not at this time required, the explanatory note reading as follows:

"Note.—Depreciation charges on maintenance of way property are not required at this time by the interstate commerce commission. It is arranged, however, in this classification to introduce this account to provide rules for computing depreciation charges on maintenance of way property for the guidance of those carriers that desire to make such depreciation charges, and for the use of such commissions of the various states as may prescribe them."

In discussing depreciation Professor Adams further says:

"5. The monthly charges to operating expenses for 'depreciation' on the several classes of equipment will, of necessity, create or require corresponding liability accounts to which such depreciation may be credited. To that end carriers will be required, beginning ....., to set up an appropriate liability depreciation account for each of the several classes of equipment upon which depreciation is charged. These accounts should be designated as follows:

"(a) Electric Locomotives—Replacement.

"(b) Passenger Train Cars—Replacement.

"(c) Freight Train Cars—Replacement.

"(d) Electric Equipment of Cars—Replacement.

"(e) Work Equipment—Replacement.

"To these replacement accounts should be credited monthly the amount of accrued depreciation on each class of equipment, respectively. Such credits should invariably equal the gross charges to maintenance for depreciation."

On analyzing these instructions it is seen that two objects are sought through the establishment of depreciation of equipment accounts:

(1) The charging to operating expenses monthly of a sum sufficient to cover the depreciation of equipment that is accruing currently over and above that loss in value which is made good through current repairs and maintenance.

(2) A means whereby there will be charged to surplus or profit and loss, in the course of a number of years, representing the average life of the property subject to depreciation, a sum equivalent to the total depreciation of equipment that had already accrued prior to some fixed date, as, for instance, July 1, 1908.

Two Objects Sought by Commission.

The fact that these two objects are coupled does not mean that both are equally desirable or undesirable—each proposition should be considered on its merits. Concerning the first object, accounting for current depreciation month by month, the writer believes that since depreciation exists it should be accounted for as it accrues.

The depreciation of equipment which ultimately results in the need for renewals is an accrued liability and should have a place in the balance sheet. This being true, the corresponding debit should appear somewhere in the accounts.

Charging accrued depreciation to operating expenses or to income and crediting a reserve account cannot affect the liability of a company to its bondholders, nor will such entries in the books, since they involve the payment of no real money, curtail the ability of the company to pay fixed charges. Further, such entries need not curtail the payment of dividends, but if the dividends are paid these entries will perform the important function of showing the stockholder that his dividend has come out of capital and not out of profits, and of showing the bondholder that his security is being impaired, facts which the investors and, in the case of a permanent institution like a railroad, the public should fully appreciate.

Whether these charges should be made to operating expenses or to income is perhaps open to argument, but it is the opinion of the writer that they should be made to income, first for the reason that depreciation is not an "expense" because it may not involve the payment of money (per contra, appreciation if shown would not be credited to earnings) and, second, because depreciation goes on independent of operation; especially is this latter true of that class of depreciation caused by the advancement of the art, sometimes designated as that due to obsolescence or supersession.

In considering the second object of the commission—the charging of depreciation already accrued to surplus—it is necessary to distinguish between companies having short-term franchises and those not so limited. As regards the former the accrued depreciation must be made good before the franchise expires or the investors—stockholders or bondholders or both—will surely suffer. With railway companies owning their rights of way, terminals, etc., in fee, the case is different and they perhaps can claim credit for the appreciation of the portion of their assets that is not subject to depreciation. This phase of depreciation accounting is discussed by Frederic A. Delano, president of the Wabash Railroad, in a paper published in The Railway Age of March 27, 1908, page 471. In this connection Mr. Delano says:

III. Depreciation of the Railroad Plant as a Whole.

"(a) Steam railroads do not have to provide for any depreciation as against the expiration of a franchise, which, of course, is a serious item with public service corporations having limited franchises. Nor is there, in the case of steam railroads, a large share of the total investment in a central power plant which is becoming obsolete. In most cases the depreciation due to the diminished value of equipment, track, bridges, structures of all kinds, shops and shop tools already referred to, is limited, as has been explained, and is, furthermore, a good deal more than counterbalanced by the appreciation due to the fact that the age of the railroad has given it an established business. This amounts to a good deal more in the case of a railroad than what is called 'good will' in the case of a mercantile corporation. As a railroad is developed industries, mines, factories, etc., are established along its tracks, with switches and sidetrack facilities, towns grow up along it and a certain amount of business becomes assured to it—business which it takes years and a large expenditure of money and energy to develop—all of which is charged into current operating expenses and should be considered as an offset to any depreciation of the property.

"(b) Besides the appreciation due to this cause there is, of course, an actual physical enhancement of value due to the condition of the roadbed and embankments becoming better solidified, the water courses established and the original structures gradually replaced with others of a more permanent character, even without any addition to capital account; thus wooden trestles, bridges, culverts, etc., have been filled with earth or replaced by steel or iron, stone or concrete.

"(c) No account is taken and no estimate can be made of the enhanced value of the railroad property (right of way and terminals) due to the enhanced value of the land, even though the existence of the railroad may have contributed largely to the development of the country through which it runs. The railroad corporation suffers by reason of this enhanced valne which it has so largely contributed to create if it is compelled to purchase any additional property, as well as in the increased amount of the taxes it is called upon to pay each year as its contribution to the needs of the growing communities; but it has not been usual to make any allowance for this. Those who have had the greatest experience with railways generally believe that the enhancement in value or appreciation of the property in the direction already referred to far more than balances the depreciation, especially when it is remembered that the total physical depreciation under

proper maintenance rules is, without doubt, limited to about half the first cost of the property subject to depreciation."

Strictly urban properties with limited franchises and those having tracks laid in the public highways cannot avail themselves of these arguments to the same extent.

Charges for Maintenance and Depreciation.

It may be desirable to cite some statistics to show how much those railways which undertake to care for current depreciation find it necessary to provide for this purpose. Here it is proper to say that expenditures for repairs, renewals and depreciation charges should all be grouped together, since any one of the three items taken separately means but little, because human nature is too apt to shift the dividing line between repairs and renewals according to the showing it is desired to make. Thus grouped it is found that the gross receipts per mile, the total of repairs, renewals and depreciation per mile, and the latter expressed as a percentage of the former are as follows for the properties which are making the largest provision for current depreciation:

Depreciation in Electric Railway Accounting—Gross Receipts and Charges for Maintenance and Depreciation per Mile of Single Track.

	Fiscal year of	Total gross receipts per mile of single track.	Total maintenance and depreciation per mile of single track.	Maintenance and depreciation in per cent of gross receipts.
Steam railways of the United States as reported to the interstate commerce commission...	1899	$ 5,308	$1,313	24.74
Steam railways of the United States as reported to the interstate commerce commission...	1902	6,453	1,684	26.10
Steam railways of the United States as reported to the interstate commerce commission...	1904	6,815	1,779	26.10
Steam railways of the United States as reported to the interstate commerce commission...	1905	6,956	1,837	26.41
Steam railways of the United States as reported to the interstate commerce commission...	1906	7,526	2,019	26.83
Steam railways reporting to New York railroad commission	1905	10,548	2,674	25.35
West Chicago Street Railroad	*1904	26,857	6,445	*24.00
North Chicago Street Railroad	*1904	33,607	7,394	*22.00
Milwaukee Electric Railway & Light Company (railway department)	1906	†25,632	4,606	17.97

*Percentage is the same in 1905 and 1906. †Gross earnings.

In addition to the electric railways given in the table roads making charges for depreciation include the following:

The United Railways Company of St. Louis began in January, 1905, to charge off 5 per cent of gross earnings, crediting it to a depreciation reserve. In 1906 the total charges for maintenance and depreciation amounted to 15.09 per cent of gross earnings. In 1907 the charge for depreciation was 5.08 per cent and the total of maintenance and depreciation was 18.69 per cent of gross earnings.

The Milwaukee Light Heat & Traction Company began in 1903 by charging 5 per cent of gross earnings for depreciation, increasing the proportion 1 per cent each year, so that the charge was 9 per cent of gross earnings in 1907, and presumably is 10 per cent for the current year. In 1907 the railway departments of the Milwaukee Electric Railway & Light Company and the Milwaukee Light Heat & Traction Company showed gross earnings of $14,330 per mile of single track; maintenance was 10.28 per cent and depreciation 6.84 per cent of gross earnings.

The Wisconsin Traction Light Heat & Power Company of Appleton, Wis., in 1907 began to charge 5 per cent of gross earnings for depreciation, the intention being to increase the proportion gradually to 10 per cent. The rate this year is 6 per cent. In 1907 the total of maintenance and depreciation for the railway department was 19.21 per cent of gross earnings.

The foregoing three companies are all under the management of John I. Beggs, who, it is believed, was the pioneer in this country in the matter of accounting for depreciation, having begun with the Milwaukee Electric Railway & Light Company in 1897.

The International Traction System of Buffalo, in its report for 1907, shows a depreciation charge of 5 per cent of gross earnings. In the 1906 report no such charge was shown, but in the 1907 report the figures for 1906 were differently stated to permit of comparison and the depreciation charge for 1906 is shown at about 4¾ per cent of gross earnings, this being subtracted from the operating expenses as shown the year before. Figures published in American Street Railway Investments show the total of maintenance and depreciation charges (no depreciation shown prior to 1906) in per cent of gross receipts for this system to have been as follows:

1903.	1904.	1905.	1906.	1907.
7.52	10.00	9.48	14.17	15.03

This indicates that the proper interpretation was not placed upon maintenance until 1906. The maintenance for 1907 was assumed to bear the same ratio to depreciation as in 1906, in order to get the 15.03 per cent given.

The Twin City Rapid Transit Company (Electric Railway Review, September 14, 1907, page 301) began to establish renewal reserves in 1905, setting aside 7.14 per cent of gross earnings in 1905, 8.54 per cent in 1906 and 8.35 per cent in 1907. The totals of maintenance and renewal reserves in per cent of gross earnings have been:

1899.	1902.	1905.	1906.	1907.
7.89	8.09	14.44	16.25	15.98

The new ordinances of the Chicago City Railway Company and the Chicago Railways Company specify that after the 3-year period of rehabilitation at least 6 per cent of gross receipts shall be spent or reserved for repairs and that 8 per cent of gross receipts shall be spent or reserved for renewals. The reserves are to be carried in cash with approved depositaries. In the case of the Chicago City Railway the total maintenance reported for the first half of 1907 was 13.05 per cent of earnings.

The Union Electric Company of Dubuque, Ia., began January 1, 1906, to set aside 20 per cent of gross receipts for the purpose of maintenance and depreciation reserves. For the railway department in 1906 maintenance amounted to 11 per cent, leaving 9 per cent of the gross receipts to apply on account of depreciation; in 1907 maintenance required 7½ per cent, leaving 12½ per cent of the gross receipts for the depreciation reserve.

The British Columbia Electric Railway Company, Vancouver and Victoria, B. C., has for some years charged depreciation at the rate of 5 per cent on steam, electrical and water machinery, 3.5 per cent on rolling stock, 10 per cent on poles, 3 per cent on lines, 2 per cent on track and 1 per cent on buildings.

The Kansas City Western Railway, operating between Kansas City and Leavenworth, and in Leavenworth, Kan., has adopted 7.5 per cent on steam and electrical machinery and rolling stock, 5 per cent on poles, 55 cents per ton on rails, 12.5 per cent on ties, 10 per cent on paving and 2.5 per cent on buildings, as the annual depreciation charges.

Referring to this table the following points should be noted:

1. The steam railways have long included renewals in operating expenses and it is fair to presume that the maintenance expenditures shown include ample provision for current depreciation.

2. The percentages of 22 and 24, respectively, for the North Chicago and the West Chicago lines were fixed after a careful survey of the property and examination of the books by the company's engineers and by Stone & Webster. An account of this work was published in the Electric Railway Review of February 23, 1907.

3. The allowance for depreciation of the Milwaukee Electric Railway & Light Company, which is 10 per cent of gross earnings, is not considered by the management to be as large as it should be. In replying to the inquiries in Accounting Series Circular No. 20 of the interstate commerce commission, C. N. Duffy, comptroller of the company, said (Electric Railway Review, April 4, 1908): "This company believes in the principle of depreciation and the practical application of the principle in providing for depreciation in its accounts; it has recognized and applied this principle in its accounts since January 1, 1897. The provision for depreciation has not been to the extent the company considered necessary, but to the extent it was consistently able to provide and give to capital some measure of fair return on its investment."

Conclusion.

From the foregoing arguments the conclusions are that current depreciation ought to be provided for and that when this is done the total charges for up-keep and replacement of the property of an electric railway will approximate one-quarter of the gross earnings. That is, one-fourth of the gross earnings should be sufficient if the road has a fair amount of traffic and a proper basis for fares.

An estimate of the amount of the charges for depreciation may be made in another way. The reports of the Chicago Union Traction Company and the Glasgow Tramways committee show that where charges for repairs and for depreciation are carefully divided the latter is about one-third greater than the former. Analysis of the reports of electric railways to the railroad commissioners of New York, Massachusetts and Connecticut indicate that these companies are expending for

"maintenance" about one-third more in proportion than the Chicago and Glasgow lines cited are expending for "repairs." From this it may be inferred that to provide for current depreciation would require an additional charge equal to 75 per cent of the usual charges for maintenance.

It is now in order to inquire what benefit may be expected from the assumption of a burden that must in many cases, for a time at least, prove to be very onerous, and the answer is that the policy must result in bringing about better relations between the public and the railways. With the facts honestly placed before the public it is not too much to hope that short-term franchises, unreasonable exactions as to compensation and inadequate fares will become things of the past. A beginning has already been made in Massachusetts, where within a few months fares on several roads have been increased from 5 cents to 6 cents, or the 5-cent zones correspondingly narrowed, and as this has the approval of the state railway commissioners the other improvements mentioned are not entirely utopian.

REINFORCED CONCRETE IN ELECTRIC RAILWAY CONSTRUCTION.*

BY N. M. STARK, CONSTRUCTING ENGINEER.

Bridges for street and interurban railways in the state of Iowa have, in the past, consisted mainly of wooden trestles or steel girders or trusses. Both steel and wooden bridges, however, are lacking in two important requisites—permanence and a continuous solid roadbed. Wood decays quickly and when used unprotected in open trestles can hardly be expected to endure for more than six or eight years. The wooden trestle may play an important part, however, in the construction of new lines desired to be put in operation quickly at low first cost, with the intention later of replacing the trestles with more permanent structures. But such a method of construction must be dictated by great necessities, as the waste due to the building with wood and later replacing with masonry far exceeds the usual return on investments in such properties.

When spans of greater length are required steel bridges have been used, but the life of a new steel bridge on masonry, even with careful inspection, can hardly be considered to be more than 20 to 25 years; and even then with continual outlay for repairs and painting in addition to the inspection. The erection of such a bridge requires first the building of the masonry substructure, then the purchasing of the metal from the mill, to be fabricated at a bridge shop and subsequently erected at the bridge site on the masonry substructure—all of which requires a considerable amount of time that may in some cases prove to be of the greatest value.

Value of Concrete Bridges.

Reinforced concrete bridges avoid the objections named above and, in fact, possess nearly all the qualities that are desirable in a bridge for railway traffic. Reinforced concrete bridges are absolutely permanent. Concrete is more durable than stone itself and concrete is the best preservative that has ever been discovered for steel. A reinforced concrete bridge, therefore, built of concrete with all of its steel reinforcement thoroughly embedded, comes as near to being a permanent structure as it is possible to devise with materials at present known and used.

But in addition to this feature of lack of deterioration this type of structure has a still more important advantage over the other kinds of bridges. Steel and wooden bridges grow weaker from rust and decay from the very first day of erection. Traffic on our steam railways has increased in weight so rapidly and steadily that many bridges built not more than 10 years ago are now too light for the traffic. Electric railways are proving no exception to this rule and the prospects are that loadings for street and interurban railways will increase even more rapidly. The day must come very quickly, then, when the bridge of decreasing strength will be overloaded by the rapidly increasing traffic and will either collapse or require strengthening or replacing. The reinforced concrete bridge, on the other hand, grows stronger with age and in a more rapidly increasing ratio than the increase of traffic; so that a bridge of this type is not only free from deterioration, but actually provides for future contingencies of travel and is therefore permanent in the highest sense.

Concrete bridges are erected with great rapidity and subject to a minimum of delays. Cement and reinforcing bars are purchasable from stock; construction can be begun, therefore, as quickly as the tools and men can be shipped to the location. As an illustration, we erected a 40-foot span reinforced concrete arch in the fall of 1907 in 12 working days and opened it for travel immediately.

Questions of Design.

If reinforced concrete bridges were built with open floor systems, similar to those of steel and wooden bridges, and which are quite as feasible in the concrete bridge, the cost of such a structure would be less than that of steel of the same carrying capacity. But to build such a permanent structure as a concrete bridge with an open floor system seems hardly consistent. The concrete bridge is so readily adapted to continuous solid roadbeds, and the advantage of such a roadbed is so great, that a concrete bridge is rarely built in any other way. Steel and wooden bridges are readily designed with solid continuous roadways, but their use so increases the cost of inspection and repairs, in addition to the increased weight of the bridge, that their adoption with such structures is impracticable. With concrete bridges, however, the continuous roadbed is the natural and preferable solution.

A bridge of this type, therefore, ought not to be compared with the more temporary structures as to first cost, because it is a much more satisfactory structure in every way and requires nothing for repairs or maintenance. In order to give some idea of cost it may be said that such concrete bridges do not ordinarily run more than 10 to 20 per cent higher than steel in first cost; a difference which is far more than offset by saving in maintenance, by the advantage of solid roadbed and by speed of erection.

Wooden trestles and steel bridges are rapidly being replaced on steam railways and on the older electric lines by concrete bridges. Such reconstruction is readily accomplished without interfering with train service, as the concrete bridge can be built around the old trestle, to be cut out later when the concrete bridge is filled and ballasted.

Building Methods.

Concrete bridges have become so popular that their construction has been undertaken by almost every contractor that ever attempted to build a masonry substructure, although their experience in this line of work may have been extremely limited. Satisfactory bridges cannot be erected in concrete by such methods. There is, perhaps, no material that is more susceptible than concrete to the hand of a master workman, nor any that is more easily disfigured and defaced by the unskilled amateur. To become a skilled foreman in this line of work it is not alone sufficient that a man should learn by costly experience at the expense of bridge after bridge; he should learn by apprenticeship under a skilled foreman of wide experience. It is as much business for experts as any other type of bridge erection. To assume that an engineer who has never had experience in the design of such structures will be able to design a satisfactory structure by referring to text books written by men who have never had experience in such lines is to expect the impossible. And, even granting that a satisfactory design is secured, then to entrust the erection to a contractor who has no interest in the design save to execute it at the lowest cost, is to invite disaster. The design and erection should be entrusted to men experienced in such lines, who will do their work with the intention of backing it up and making right anything that may prove unsatisfactory.

In seven years past we have constructed some 75 to 100 reinforced concrete arches and culverts of various sizes, employing various forms of reinforcement to suit the purchaser; and after extended experience we have come to the conclusion that what is known as the "Luten" system of reinforced arches offers the greatest advantage to the purchaser in economy, rapidity of construction and rational design, with consequent safety. This system of construction consists of reinforcement of plain rods placed in the tensional regions of the arch. Coupled with this are numerous improvements in bridge construction, as, for example, the flood-proof pavement laid across the bed of the stream.

Another feature particularly adapted to small arches and culverts for railways, especially under heavy fills, is the horseshoe arch, so called from the form of its end. This type of arch, instead of being provided with wings and spandrel walls, as has been the usual design of arches, has the barrel of the arch extended until it meets the plane of the side slope of earth filling. The barrel of the arch is cut to fit this slope and the sharp edge that would result is avoided by squaring the end of the arch ring, normal to the intrades or soffit of the arch. A shoulder is provided over the top of the ring to hold the toe of the earth slope. An arch of this type can be built for about 25 per cent less in first cost than the usual spandrel and wing type because of the saving in forms and materials. The centering for the arch is extended to the

*A paper presented at the meeting of the Iowa Street and Interurban Railway Association, Des Moines, Ia., April 23 and 24, 1908.

ends of the excavation and the horseshoe end troweled to the desired surface without the expense of placing any more forms than those for the centering only. An arch of this kind represents the maximum of efficiency for locations where a cheap and very effective structure is desired and where considerations of appearance do not require a more attractive type.

From this type of culvert to the immense bridge built across the Maumee river near Toledo, O., last year, is a big step; yet it represents a structure which is quite as readily adapted to the Luten system. This Maumee bridge has 12 spans of 75 to 90 feet each, making a structure 1,200 feet long. The grade of roadbed is 45 feet above low water. The bridge is a single-track structure with 16 feet of roadbed between copings, and was built for the Lima & Toledo Traction Company of Cincinnati, O. It will be thrown open to traffic in May of this year.

These various bridges are typical of hundreds that have been erected the past seven years under this system and are now being used by electric railroads in Indiana and Ohio, where, by the way, electric railroads have had their greatest development. The Indianapolis & Northwestern Railway has over 50 arches of the horseshoe type in as many miles of track. This type of bridge has been adopted by these lines because it represents the most efficient bridge that can be procured for a permanent type of construction. Compared with the ordinary forms of plain concrete culverts or masonry arches, these bridges represent a saving of 25 to 50 per cent. Add to this the fact that they are flood-proof and practically indestructible, and little more can be asked in the way of the ideal railroad bridge.

CLAIMS—METHODS OF HANDLING BY ELECTRIC RAILWAYS.*

BY ARTHUR W. GROSS, GENERAL CLAIM AGENT OMAHA & COUNCIL BLUFFS STREET RAILWAY.

Claim departments of electric railway companies are conducted along similar lines, each company, of course, having some peculiarity of its own. It is hard to say which shows the best results. At the close of the year the footings are observed to ascertain what has been accomplished—not alone to learn the amount of money expended and the number of claims disposed of, but how much, in the way of pending claims and suits, is left on our hands to contend with.

System at Omaha.

While I am not prepared to state that the method of handling claims by the Omaha & Council Bluffs Street Railway Company is better than others, I must, with your kind forbearance, necessarily confine myself to the workings of our claim department. I shall begin with the happening of an accident.

When the accident is of ordinary character reports are made by the trainmen during that day, upon blanks kept at the car house office and turned in to the foreman, who forwards them to the claim department. Vertical files are made for each set of reports, entered numerically in a record book and filed away to correspond in a cabinet holding the reports of four years' business, this being the period of our statute of limitations in Nebraska, so that complete records are before us at all times. Our superintendent of transportation immediately follows the accident from an operating standpoint, for the purpose of determining if it was caused through the carelessness of the conductor or motorman. If this is found to be the case the delinquent one is given a heart-to-heart talk, and it is explained to him just where he was negligent, what the result of his negligence was or might have been. Unless the accident is one of liability, or partially so, no investigation is carried on until a claim or demand is made. Then an investigator will interview the witnesses, obtain written signed statements from them and procure a detailed signed statement from the claimant whenever possible.

In cases of liability, such as collisions, derailments, etc., resulting in serious injury, the trainmen are required to report to the claim department. Our policy is to get in touch with the injured person or members of the family. If his condition is such as to permit of making a settlement we attempt to do so at once; always guarding against the fact, however, of taking a release which could be attacked and invalidated on the ground of incompetency. Where it is deemed inadvisable, or a settlement cannot be effected, our efforts are directed toward keeping the lawyers out and bringing about an adjustment at the first opportune time.

One of the most successful pieces of work accomplished by us, although the most unfortunate accident the company has ever had, occurred when two cars came together in a head-on collision, the southbound car getting beyond control of the motorman while running down a steep grade, leaving the track and plowing through the northbound car on the parallel track. Three persons were killed and 48 others more or less seriously injured. It required considerable time and labor to effect settlements in all of these cases, yet only one got away into the hands of a lawyer, and that because the amount claimed was unreasonable and we were willing to risk a lawsuit.

We do not employ a regular company surgeon, but call upon various doctors when desiring examinations, thereby eliminating, to some extent, the feeling that the report or testimony is given with a view of unduly aiding or assisting the railway company. There is very little oppositon to our obtaining written medical reports, upon blanks furnished by us, from attending physicians. We pay a fee of $2.00 for such service.

The claims considered by all as most difficult to handle are those where reports have not been made by the trainmen and the claim department has no record nor knowledge of the accident except as received through the claimant or his attorney. This class of cases requires an endless amount of work before results (if any) are obtained.

We attempt to locate the crew, using for this purpose the time schedule of cars and such other facts as have come into our possession. In some instances we send a tracer to the car houses, setting forth the details of the accident and the crews working on certain lines. The men are required to answer "Yes" or "No" opposite their respective names. Occasionally we draft separate affidavits to be signed and sworn to individually. Every avenue of information is penetrated, commencing at the scene of the accident, following it to the injured person's home and throughout the neighborhood in which he lives, and the places frequented by him. Where the claim appears to have the ear marks of fraud we will fight it to the end.

Preventing Accidents.

Let me say a few words regarding the efforts we are making toward the prevention of accidents. It means so much, and the mutual benefit derived is so great, that I am firmly inclined to the belief of its being the only method through which the red ink entries, now so glaring upon the records of a claim department, can be made a nightmare of the past.

In explanation of that part of our anti-accident campaign which consists of talks made by the general manager or assistant general manager, superintendent of transportation, assistant superintendent of transportation and the claim agent to the conductors and motormen of the various divisions of our system, some of the matters touched upon follow:

That trainmen see and know but one side of an accident.

That they do not realize that accidents carry with them a world of sorrow, grief and hardship.

That the saving of life, limb and property should be uppermost in their minds.

That they would be staggered by the enormous outlay and expense made necessary in the settlement and handling of claims.

That it is the duty of a conductor or motorman to prevent, if possible, every accident, including those resulting from the carelessness of passengers and pedestrians.

In addition to the talks to our conductors and motormen we are also taking other steps looking toward the prevention of accidents. For instance, we have had published in the newspapers a series of talks to the public cautioning them to be careful on and about street cars; we also have placed in all of our cars a picture illustrating the right and wrong way of getting off a car, which we had made from photographs taken from life and on which we designated the right way as "safe and graceful" and the wrong way as "dangerous and awkward."

We have also enlisted the support of the principals and teachers of schools, and the probation officer and his staff, in keeping boys from jumping on cars and children from playing in the streets on which there are car tracks. The aid of the physical director of the Young Women's Christian Association also has been enlisted in educating the young women as to the proper way to get on and off cars.

Our men exhibit a very fine spirit in this educational campaign and have shown themselves just as eager to prevent accidents, when the matter is put before them in the proper light, as we are ourselves.

*Abstract of paper read before the Iowa Street and Interurban Railway Association at Des Moines, Ia., April 24, 1908.

INTERSTATE COMMERCE COMMISSION STATISTICS AND ACCOUNTS.*

BY C. L. WIGHT, AUDITOR INTER-URBAN RAILWAY, DES MOINES, IA.

The present system of classification of accounts of electric railways is the result of over 11 years' study by the responsible heads of the accounting departments connected with the various street and interurban railways of this country. At each annual meeting of the Accountants' association revisions of the classification have been made after much debate, and, as the result of extended correspondence, the classification became the standard method of accounting and has been adopted by nearly all of the electric railways throughout this country and Canada. So thoroughly and comprehensively has this work been done that the various state railroad commissions have adopted our system of accounting for their annual reports.

At the last annual meeting of the American Street and Interurban Railway Accountants' Association, held at Atlantic City, N. J., in October, 1907, representatives of the interstate commerce commission were in attendance and participated in the discussion of each item of our classification, and a tentative classification was agreed upon, which was believed to be applicable to all city street railways and the passenger and freight departments of all interurban railways, and which it was confidently thought would be adopted by the interstate commission.

On February 26, 1908, we were treated to a surprise in a new tentative classification from the interstate commission, which raised the number of main accounts from the original 59 to 116, together with subaccounts and sundry clearing and adjusting accounts. This classification differs materially from what has been considered the standard, thus making comparative reports difficult, if not of doubtful value. As this new classification was doubtless intended to cover the accounts of steam railroads, as well as of city and interurban railways, express companies, etc., it follows that only such of the items as are applicable to each enterprise can be used.

The commission also makes a division between large and small companies, fixing gross receipts for the small roads at $50,000.

The subject of "depreciation" is also under discussion—a subject of such importance that no reference is made to it in the tentative classification, although in the circular dated January 10, 1908, considerable attention is given to the matter. In this circular, Accounting Series No. 20, the commission makes it plain that its system of accounting is to be the only standard. The circular states: "In the first instance, it should be distinctly understood that the interstate commerce commission represents the interest of the states as well as its own interests. * * * There are at the present time 30 states whose laws give to state railway commissions, or other legally constituted bodies, jurisdiction over electric railways, and this circular is issued after correspondence with and approval of the representatives of the state governments." In view of such a statement, what recourse can we have from any decision the commission may officially make regarding the classification of accounts?

The conditions attending the operation of electric railways are so varied that it has been found impossible to make a classification entirely suitable or satisfactory to every road, and in the attempt to arrive at even a fair degree of uniformity in accounting, many concessions were made, which resulted in our present classification.

The same conditions do not obtain among interurban railways: some do a purely passenger business; others add a package express; others carry large quantities of local freight; and very few, except the Inter-Urban Railway of Des Moines, enter into interline passenger and freight connections with steam railroads, which necessitate largely increased expenditures in all departments. This road is therefore obliged to conform to the established rules, methods and blanks of the steam roads, and must conduct the accounting department exactly as they do, inasmuch as we are doing the same kind of business. We sell passenger tickets to all parts of the country and ship carloads of merchandise or live stock to any point, making joint rates with connecting lines. We use their cars and they use ours, therefore items of "demurrage," "car service," "tariffs," "absorption of charges," and a multitude of other terms and accounts are added to the ordinary interurban system. While these are familiar to steam road accountants, let no one imagine that to the usual city or interurban accounting force it is an easy matter to absorb this sort of education.

In following the instructions of the interstate and state commissions the accounting department must rely largely on the superintendents and foremen for accurate reports of the labor and material used under their supervision. It therefore follows that men of experience, good judgment and fair education must be employed for such positions, with salaries to correspond.

The text allotted the writer is one which may be productive of extended discussion. Some will believe that the proposed change in accounting methods will be sure to cause confusion and increased expenditures without corresponding benefit; others will consider that the impossibility of comparative statements with former years is a vital defect.

It appears to the writer that objections made by any road or association of roads will be overruled by the commission, and that we shall be compelled to follow its ideas and system of accounting.

*Abstract of paper read before the Iowa Street and Interurban Railway Association at Des Moines, Ia., April 24, 1908.

CENTRAL ELECTRIC ACCOUNTING CONFERENCE MEETING.

A special meeting of the Central Electric Accounting Conference, called to discuss the tentative interstate commerce commission classification of accounts, was called to order by the chairman, M. W. Glover, auditor Ohio Electric Railway, at the Lima House, Lima, O., on Thursday of this week at 12:45 p. m. Mr. Glover asked F. D. Carpenter, president of the Central Electric Railway Association, to act as chairman of the meeting. The object of the meeting was then explained by Mr. Glover, who discussed the importance of uniform and prompt action by the electric railways of Ohio and other states in the Central Electric territory in relation to Accounting Series Circular No. 20 of the interstate commission.

W. H. Forse, Jr., treasurer Indiana Union Traction Company, spoke of a meeting of representatives of Indiana companies at which replies to the circular of the commission were considered. The question had arisen whether the commission, in its request for data, desired information concerning the operating or the underlying companies, but it was decided that the intent was to secure facts relating to the operating companies. It was believed by the representatives of these companies that gross earnings of $500,000 should be the limit of demarkation between a large and a small company. It was decided that the inquiry as to the present surplus or deficit meant the figures of the operating company, starting from the date of commencement of operation. It was thought that the entire surplus was meant, without relation to whether it resulted from railway or other operations, such as gas or electric lighting, but that in case the company operated more than one class of public utility it would be well to state that some part of the result was derived from operations other than railway.

Mr. Forse stated that he had made an effort to divide the 1907 operating expenses of the company with which he is connected into the 116 primary accounts provided in the classification of the interstate commission but that out of the total number of accounts he was able to use only 72. Of the total amount distributed between the 72 accounts, 89.2 per cent was charged to 26 accounts, 5.5 per cent to 9 accounts and 5.3 per cent to 37 accounts. Stating the result in another way, 94.7 per cent of the total was confined to 35 accounts. Charges to some accounts were as small as one ten-thousandth of 1 per cent. Explaining further the importance of the interstate circular, Mr. Glover said:

Statement by M. W. Glover.

Circular No. 20 states that it should be distinctly understood that the interstate commerce commission represents the interests of the states as well as its own interests in the effort to develop a uniform system of accounts for electric lines, and goes on to say that, at the present time, 30 states give jurisdiction over electric railways to their state railway commissions and intimates that the classification adopted by the interstate commission for electric railways will be adopted by the state commissions throughout the country. While a number of electric railways in this territory may not now be subject to the supervision of the interstate commission, if the

classification under discussion is adopted by the state railroad commissions of the central states, every line will become vitally interested in and will be required to use the classification.

The American Street and Interurban Railway Association, recognizing the importance of a full discussion of Circular No. 20, has issued several circulars urging electric railways to comply with the request of the commission to consider carefully the tentative classification submitted, making criticisms and suggestions which in their opinion might bring the classification into a more satisfactory form. It is, therefore, appropriate for the electric railways of the central states to criticize the proposed classification in the hope that by united action of the lines in this territory, which are more fully developed than the lines in any other portion of the United States, we may succeed in obtaining certain modifications which are most desirable, if not absolutely necessary, to secure a classification which can be used and which will be of service to the interstate commission, the state railway commissions and the owners of the properties.

With reference to the claim of certain lines lying wholly within a single state, concerning the jurisdiction of the interstate commission, I quote as follows from a communication of James S. Harlan, commissioner of the interstate commission:

"Regardless of the physical location of either electric or steam railroads and whether their lines begin and end in the same state or not, if either is engaged in the transportation of property from a point in one state to a point in another, wholly by rail or in connection with a water carrier under some arrangement for a continuous movement, the act (interstate commerce act) applies in all its phases."

Therefore, whether or not this classification is adopted by the various state commissions, a large number of electric railways will be subject to the supervision of the interstate commission and we should endeavor to have this supervision exercised in such a manner as to produce the best results for the owners of our properties, as well as for the interstate commission.

The Electric Railway Review of April 11 contains a communication from the Michigan railroad commission, declining to adopt the proposed classification, and the Electric Railway Review of April 18 contains a communication from the New Hampshire railroad commission stating that the assistance of the interstate commission is not needed in handling the accounts of electric railways in New Hampshire. Both of these commissions previously intimated to the interstate commission, in reply to a communication on the subject dated November 13, 1907, that they would co-operate with the interstate commission; the New Hampshire commission then stated that it would adopt the system of accounts used by adjoining states and the interstate commission; but evidently after examining the proposed classification both of these commissions have realized that the classification is entirely unsuited to the needs of electric railways and are not willing to adopt it in its present form. It therefore appears that if the proper objections are presented to the interstate commission it will be willing to modify the classification and it may be possible for us to obtain a classification which will be satisfactory to all electric railway lines.

In connection with the task undertaken by the interstate commission to supervise the accounts of railway properties, both steam and electric, Prof. H. C. Adams, discussing certain principles in formulating the system of accounts and indicating the results which are to be obtained and which are expected to show in sufficient detail the actual financial standing of the properties and furnish a true statement of their value, says:

"Such a general statement will show the significance and importance of this part of the accounting scheme, and will, I am sure, emphasize * * * that control over accounting does in fact permit the government to exercise a certain degree of supervision over the management of railway property. Of course the accounts themselves would be of little use were it not for the fact that the law also provides for examiners whose duty it shall be to examine the accounts of the carriers and determine whether or not the prescribed rules of accounting are followed."

From this you will understand that the accounts of electric railways will be examined from time to time by representatives of the interstate commission and every requirement of the commission will have to be carried out regardless of the expense involved.

No criticism can be made of the general principles laid down by the interstate commission regarding the desirability of a uniform system of accounts for electric railway lines. The fact that the electric lines of the country have no classification of operating expenses now in use by all lines shows the desirability of obtaining such a classification as will meet the requirements of lines both large and small. While the classification proposed by the American Street and Interurban Railway Accountants' Association has been adopted in part by a number of lines, my experience has proved that this classification is not adapted entirely to the needs of interurban lines and certain modifications have been made in the past to enable interurban lines to use, so far as possible, the classification proposed by the association and to bring into the classification certain other items which were not contained in it originally. The revised classification adopted by the Atlantic City convention in October, 1907, is more satisfactory than the original classification which has been in use since 1903 and, while there are certain objections to the classification adopted at Atlantic City, it must be admitted that it is far better and more satisfactory to the majority of electric railway lines than the classification proposed by the interstate commission; in fact, there are certain features of the proposed classification covered by Circular No. 20 which, in my opinion, are impossible to carry out, and I feel satisfied that the commission will listen to any criticisms of the classification which may be presented and will be found willing to meet the views of electric railway lines whenever possible to do so.

It is hoped that all present realize the importance of this matter and that some action will be taken by the lines represented to present objections to the interstate commission which will result in a simpler and more satisfactory classification of accounts than that proposed by Circular No. 20.

GRAND JURY REPORT AND STATEMENT OF THOMAS F. RYAN ON METROPOLITAN FINANCING.

The special grand jury at New York which has been engaged since January 6 in investigating the affairs of the Metropolitan Street Railway Company in relation to charges brought against the financiers who have been connected with the company by William M. Ivins, William N. Amory, William F. King and others, on April 20 submitted to Justice Dowling of the criminal branch of the supreme court a presentment in which it declared that it had not been able to find, in its investigation of the New York traction situation, evidence showing a commission of crime on which it could act. The jury also filed, as a part of the public record, the complete minutes of its investigation, containing the testimony of Thomas F. Ryan, H. H. Vreeland, Anthony N. Brady and others. The grand jury investigated each charge separately and the verdict on each was that it was unfounded or outlawed or that there was no evidence of criminality, although several cases of contributions for political purposes were declared worthy of condemnation. The minutes, which amount to over 1,000 pages, give a very complete review of the financial history of the Metropolitan company.

Coincident with the grand jury's presentment Thomas F. Ryan made public a statement which he had previously presented to the grand jury when he appeared before it to testify as to his connection with New York traction matters. In this statement Mr. Ryan reviews the process of evolution of the Metropolitan system from 1885, when the Metropolitan Traction Company of New Jersey was formed, down to the years 1897, 1898 and 1899, when the Metropolitan Traction Company was dissolved and succeeded by the Metropolitan Street Railway. Mr. Ryan defends every step taken by the organizers, declaring that every purchase of subsidiary lines was legitimate, that there was no watered stock, that none of the so-called "insiders" ever had a dollar's interest in any of the system's contracts, and that all the stories of "millions in profits to insiders" are absolutely false, because such profits never existed.

In conclusion he says: "The failure of the surface lines was not due to any of the causes alleged, but to conditions which were mainly the results of state interference. Among these are:

"1. The extension of the free transfer obligation by legislative enactment and court decisions, so that the fare per passenger has been reduced from five cents to only a little more than three cents.

"2. Enormous increases in taxes, the special franchise tax alone having almost doubled the system's burden of taxation.

"3. The extraordinary congestion of street traffic, resulting in greatly increased cost of operation and maintenance, and also in an abnormal burden of accident claims, this item alone amounting to $2,000,000 a year, or about 10 per cent of the gross receipts.

"4. The competition of subway lines, built with the aid of the city's credit.

"These causes have reduced the net earnings of the system fully $6,000,000 a year, or more than 10 per cent upon the company's capital stock. The company was not 'looted'; it was throttled."

News of the Week

Strike in Chester, Pa.

The strike of the motormen and conductors of the Chester (Pa.) Traction Company, which was declared on April 13, because the company reduced the wage scale from $18\frac{1}{2}$ to $16\frac{2}{3}$ cents an hour, has developed into a very serious situation. The city has been under martial law since last Thursday, and, although several companies of the state militia have been stationed in the city, scenes of violence have been numerous and several persons have been shot. The first car was operated since the strike was declared on Wednesday of last week and since Sunday cars have been operated on all the lines during the daytime. There has been little traffic, however, because of the frequent disturbances and because of a boycott which has been declared against the company. Several unsuccessful attempts have been made to secure arbitration, but President Rigg has stated that the company's earnings have fallen off so much that it was forced to reduce wages and that he has no intention of yielding to the strikers. A large number of strikebreakers have been imported from New York to operate the cars and some of the strikers returned to work on Tuesday of this week, when an attempt was made to run cars on a regular schedule.

The city police have rendered little assistance to the company and the city council has favored the strikers. On Monday the council passed resolutions censuring the company and ordering it to make certain improvements at once.

Report on Chicago Elevated Loop.

George Weston, who was recently engaged by the Chicago city council's committee on local transportation to investigate the subject of increasing the capacity of the union elevated loop, submitted a report on Thursday of this week. After a thorough investigation Mr. Weston makes the following recommendations: Through routing of the cars of the South Side Elevated Railroad and the Northwestern Elevated Railroad, extension of station platforms so that two 6-car trains can load and unload at the same time; universal transfers, with five transfer stations on the loop; and development of stub terminals. In connection with the through routing plan Mr. Weston recommends an alternating system by which half of the north and south trains would use the east side of the loop and the other half the west side of the loop. To offset the opposition which has been made by property owners on the loop streets to the proposed extension of station platforms Mr. Weston suggests that by the use of prismatic glass in the floors of the station platforms light may be deflected into the store windows.

By adopting these changes Mr. Weston says that the capacity of the loop may be increased 43 per cent. or from 680 cars an hour to 1,068, with 55,536 seats in place of 35,360 as at present. He points out, however, that the remedies suggested are but a temporary arrangement, which the constantly increasing traffic will ultimately render inadequate, and that "a complete and comprehensive plan must be devised to ultimately provide in a full and satisfactory manner for the traffic through the congested business district, and which shall tend to stretch out and enlarge this district."

Employment of Trainmen in Baltimore.

Bulletin No. 8 in the series of newspaper advertisements published by the United Railways & Electric Company of Baltimore discusses the system of employment of motormen and conductors, and says in part:

"The company conducts a regular school for prospective motormen at the Pennsylvania avenue car house. They are kept at school until able to pass the required examination. Failure to pass this examination within a reasonable time results in rejection.

"Those who are successful are assigned to a particular line and placed in charge of an experienced motorman, who instructs the student on the car and gradually turns over the operation of it to him. While this training is in progress the superintendent of motormen frequently rides upon the cars, in many instances without knowledge of the students, and it is not until he, too, is satisfied that a certificate of competency is issued. The training, however, is not yet complete, as the students must go before the superintendent of transportation and receive final instructions, in addition to those contained in the book of rules.

"One of the most important requirements from the street railway point of view is that all employes shall be courteous to passengers and patient at all times. At times it becomes necessary to dismiss men. While men may otherwise be competent, their manner may be discourteous to passengers or they may not possess the requisite patience. Discourtesy, laziness, complaints of passengers, lack of interest and the many things which render men incompetent in other lines, make them undesirable for employment by the railway.

"After employment we endeavor to hold the best men in the company's service. Wages are adjusted according to term of service, and honor stripes are placed upon the sleeves of the men—a silver stripe for service of not less than three years and a gold stripe for every five years' service."

Legislation Affecting Electric Railways.

District of Columbia.—The street railway bill, which provides for an extension of the Washington street railway lines to the new union station, was considered in the house on April 20 and was returned to the senate for further conference, after the house had insisted on its amendments providing for universal transfers and supervision of the street railway companies by the district commissioners. The senate conference committee proposed some changes in the route and has held out for a provision for a charge of two cents for transfers, with no amendment providing for supervision.

New York.—The senate on April 22 passed by a vote of 36 to 9 the 5-cent fare bill, which provides that no street railway company shall charge more than five cents fare for a continuous ride over lines leased or owned by it without first securing the consent of the public service commission. The bill is intended to prevent the Brooklyn Rapid Transit Company from charging a 10-cent fare from New York to Coney Island.—On April 21 the assembly passed the bill introduced by B. R. Robinson, which has had the support of the public service commission, amending the Elsberg rapid transit law so as to permit the construction of subways in New York City by private capital. The bill provides that franchises may be granted to private corporations for the construction and operation of new routes or extensions for a prescribed period not to exceed 50 years, at the expiration of which time the city may purchase the property at the cost of construction and resell it to another company. The bill also increases the term for which a municipally constructed road may be leased from 20 years, with a renewal of 20 years, to 35 years, with a renewal of 20 years.—The senate has concurred in the changes made by the assembly in the constitutional amendment exempting from consideration in the debt limit of New York City bonds for the construction of rapid transit lines or docks which will be self-supporting.

Ohio.—The McCord bill, now pending before the legislature, gives interurban roads the same right of condemnation of property for right of way as is now possessed by steam railroads.

Near Settlement of Cleveland Controversy.

On Tuesday of this week F. H. Goff, representing the Cleveland Electric Railway Company, offered to lease the property to the Municipal Traction Company at a valuation equal to $55 a share on the company's 234,000 shares of outstanding stock, after deducting indebtedness, with a security franchise providing for six tickets for 25 cents. Mr. Goff had originally asked for $72 a share and later offered to settle for $60 a share. Mayor Johnson, who has steadfastly refused to offer more than $50 a share, expressed himself as satisfied with the offer of $55 and urged the city council to accept it. It was finally decided to give the people an opportunity to be heard on the subject before final acceptance and arrangements were made for mass meetings to be held in every ward of the city until Saturday night. If the people express their approval, as it is believed they will, it is planned to have the agreement ratified by the council on Monday night and the security franchise passed, with a provision for six tickets for 25 cents.

In case a settlement is reached on Monday it is planned to make the lease operative at once and operate the lines at a 3-cent fare, although President du Pont of the Municipal Traction Company has announced that a small charge will probably be made for transfers for a short time as an experiment. The Municipal Traction Company also is planning to make extensive improvements to the system. The lease provides that $1,500,000 of capital stock of the Cleveland Railway Company may be issued from time to time at the request of the traction company for track extensions, betterments and improvements; $1,350,000 for purchasing new rolling stock; $2,150,000 for new power houses and car shops; and $1,500,000 for the construction of a high-level bridge across the Cuyahoga river.

For several days previous to Mr. Goff's final offer of $55 preparations had been made on both sides for a renewal of the competition between the Cleveland Electric Railway and the Forest City Railway. On Thursday, April 16, the city

council passed, under suspension of rules, an ordinance granting 15-year franchises to the Forest City Railway covering many of the Cleveland Electric lines whose grants the city claims have expired, including the important Woodland avenue and other west side lines. Like the other Forest City grants the ordinance provides for a 3-cent fare. The ordinance was passed under the provisions of the new Schmidt law, which gives councils the right to grant franchises without the consent of property owners two years prior to the expiration of an old grant or within one year after such expiration. Consequently, even if the Cleveland Electric Railway's claim that the franchises do not expire until 1910 is upheld, the franchises would be secured to the Forest City company. The ordinance does not become effective until April 27. If a settlement is reached by that time the franchises will be granted to the Cleveland Electric Railway under the security grant. Otherwise the Municipal Traction Company planned to purchase the Cleveland Electric's property in the streets.

At the same meeting the council granted a franchise to the Neutral Street Railway for the Central avenue and Quincy street lines.

The ordinances were passed in great haste, as the city officials were afraid that the legislature might take some further action that would nullify the effects of the Schmidt law. As soon as word was received that the governor had signed the bill the mayor called the council meeting and the ordinances were rushed to print. The Cleveland Electric attorneys have announced their intention of attacking the constitutionality of the law.

On Saturday, April 18, the stockholders of the Forest City Railway Company voted to increase the capital stock from $2,000,000 to $6,000,000. The sale and issue of the new stock is to be subject to action by the Municipal Traction Company and none is to be sold below par. It was stated that although a successful termination of the peace negotiations was expected the company desired to be prepared for any contingency and that the increase of stock was to provide for building new lines and equipment for the streets covered by the new franchises or for acquiring the property of the Cleveland Electric Railway in those streets.

Central Electric Railway Association Meeting.—The next meeting of the Central Electric Railway Association will be held at Toledo, O., on May 21.

Missouri Electric Light Gas and Street Railway Association.—The annual convention of the Missouri Electric Light Gas and Street Railway Association was called to order on Thursday morning of this week at the Marquette hotel, St. Louis, Mo.

Indiana Electric Railways Ask Tax Reductions.—Representatives of Indiana electric railway companies appeared before the Indiana state board of tax commissioners on April 21 and 22 to present arguments in regard to their assessments for the coming year. Nearly all asked for reductions on the ground that earnings had greatly decreased or that large expenditures had been made for extensions and improvements which had as yet rendered no return on the investment.

Suit for Violation of Public Service Commission's Order.—The New York public service commission of the first district has instructed its counsel to bring suit against the Brooklyn Elevated Railroad to recover the penalty of $50 a day for failure to obey an order of the commission to install a wrecking car at the Brooklyn terminal of the Brooklyn bridge, so that time might be saved in making repairs to cars which might obstruct traffic on the bridge. The order was issued after a hearing on February 13 and was made effective on March 1.

American Society of Mechanical Engineers.—The semi-annual meeting of the American Society of Mechanical Engineers will be held in Detroit, Mich., on June 23 to 26 inclusive. Among the papers to be presented at this session are "A Method of Cleaning Gas Conduits," by W. D. Mount; "A Method of Checking Conical Pistons for Stress," by Prof. George H. Shepard; "Clutches," with special reference to automobile clutches, by H. Souther; "Horsepower, Friction Losses and Efficiencies of Gas and Oil Engines," by Prof. L. S. Marks; "Some Pitot Tube Studies," by Prof. W. D. Gregory; "The Thermal Properties of Superheated Steam," by Prof. R. C. H. Heck; "A Journal Friction Measuring Machine," by Henry Hess; "A By-Product Coke Oven," by W. H. Blauvelt; "Tests of Some High-Speed Steam Engines," by F. W. Dean. There will be a symposium upon machinery for conveying materials, with papers by several authorities. The Society for the Promotion of Engineering Education and the Society of Automobile Engineers will also hold their annual meeting in Detroit at this time, which will enable members of each society to participate in the sessions of the others.

Traffic and Transportation

Coney Island Fare Case.

A hearing regarding the 10-cent fare charged to Coney Island by the Coney Island & Brooklyn Railroad took place on April 10 before Commissioner Bassett of the New York public service commission, first district. John A. Thake, assistant secretary and treasurer of the company, showed that where the average amount of second fares a year for the last five years was $97,000, it had been falling off steadily, and last year was only $88,000. To wipe out this revenue would cause a large deficit, he declared.

Frank R. Ford testified that there would be an annual deficit now if the proper amount was laid aside each year as a reserve fund for renewals. Taking into consideration the distance from Park Row to Coney Island the receipts per passenger per mile at 10 cents fare were only 0.89 cent, which is below the average receipts throughout the country.

Orders for More Seats in Non-Rush Hours in New York.

The New York public service commission, first district, has passed orders which are designed to require the receivers of the New York City Railway to provide a seat for every passenger, except in the rush hours, on the Twenty-third street crosstown line, the Lexington avenue lines and the Grand street line. The orders are to go into effect on April 27. In an opinion which accompanied one of the orders Commissioner M. R. Maltbie said: "The purpose of this order is to give every one a seat, and a 10 per cent excess of seats over passengers has been required because of the irregularity of traffic and of cars. Whether a 10 per cent excess is sufficient to accomplish this result cannot be determined without experimenting, and it is possible that after a trial has been had it will be necessary to either increase or decrease the percentage of excess suggested.

"The alternative proposition suggested, namely, that if a 10 per cent excess of seats over passengers is not provided a certain number of cars must be run, has been placed in the order because it is physically impossible, under the conditions which obtain in New York, to always provide a seat for every passenger. The traffic is so heavy at times that to attempt to provide every one with a seat would so interfere with the carrying capacity of the line that the time consumed in passing from one point to another would be so great, because of the low rate of speed due to great congestion, that the advantage of a seat would probably be more than offset by the increased time required."

Increase in Rates.—The Long Island Railroad has increased single-fare rates from Long Island City and Manhattan Beach from 25 to 30 cents and round-trip tickets from 40 to 50 cents.

Transfer Law Violated in Birmingham, Ala.—Officials of the Birmingham (Ala.) Railway Light & Power Company have complained to Sheriff Higdon regarding many violations of the transfer law.

Abandonment of Transfers in New York.—Under orders from the New York public service commission, first district, inspectors are engaged in studying the curtailment of transfers between the Third Avenue Railroad and the Metropolitan Street Railway Company, New York. The commission intends to investigate the subject from a legal and a practical standpoint, and the inspectors have been instructed to find out how many persons are affected and how the operation of the roads is affected. A map made for the commission shows that 57 transfer points heretofore in use have been maintained, while 48 have been abandoned.

Use of Steam Cars by Michigan United Railways.—The Michigan railroad commission is considering whether the Pere Marquette Railroad can be compelled to switch cars to the tracks of the Michigan United Railways so that the cars can be transported to De Witt, Mich. At present the freight from the Pere Marquette road is transferred to the cars of the Michigan United Railways and is distributed to various stations by the electric road. The agent of the Pere Marquette road states that his company is willing to switch cars to the Michigan United Railways if the latter will pay rental for the cars while they are being unloaded. The matter will be considered on June 24. Similar cases are pending between the Detroit United Railways and the Grand Trunk Railway at Flint and between the Michigan Central Railroad and the Detroit United road at Oxford. The latter cases will be decided on April 28.

Construction News

FRANCHISES.

Chattanooga, Tenn.—The Chattanooga Railways Company has secured a franchise to build a line in Rossville avenue. D. J. Duncan, general manager.

Chesaning, Mich.—The Saginaw Owosso & Lansing Railway Company of Detroit, which proposes to build an electric line from Saginaw to Lansing, Mich., has been granted a franchise in Chesaning. (Noted April 18.)

Lincoln, Neb.—A franchise has been granted to the Citizens' Railway Company, Lincoln, Neb., to extend its line to University place and Havelock, Neb., with a possible extension later to Ashland.

Los Angeles, Cal.—A franchise granting the Los Angeles Railway Company permission to operate its line in South Park avenue was passed by the council over the mayor's veto on April 13. The franchise is for 21 years and replaces a former franchise which was declared illegal. The company pays the city $500 compensation.

San Francisco, Cal.—The United Railroads of San Francisco and the Sutter Street Railway companies have been granted a 52-day extension to their temporary permit to operate cars by overhead trolley on the outer tracks of lower Market street.—The Presidio & Ferries Railroad Company has been granted a temporary permit to operate overhead trolley service on seven blocks of Larkin, Vallejo and Franklin streets, pending the advertisement and award of a franchise over this route expiring on December 10, 1913. The purpose of the franchise is to enable the company to avoid the steep Union street hill between Franklin and Larkin streets.

Terre Haute, Ind.—J. W. Shanks, representing the Grand Central Traction Company, which proposes to build an electric line from Indianapolis to Evansville with a branch from Bloomington to Terre Haute, has applied to the board of public works for permission to enter Terre Haute. The company owns a private right of way and the franchise is for the privilege of crossing the streets from the southern city limits to Main street. It is stated that work will be started as soon as the franchise is granted.

RECENT INCORPORATIONS.

Alton St. Louis & Cairo Railroad, East St. Louis, Ill.—Incorporated in Illinois to build an electric railway from Alton through Madison and St. Clair counties to East St. Louis, Ill., and from East St. Louis to Cairo through St. Clair, Monroe, Randolph, Jackson, Union and Alexander counties, with a branch to Columbia, Waterloo and Mammoth Cave in Monroe county. Capital stock, $100,000. Incorporators: B. L. Renfrow, Dr. C. H. Walters, William L. Ensol, George M. Switzer and C. B. Meredith, all of Springfield, Ill. Col. Thomas N. Chase of St. Louis, Mo., is promoting the road. It is stated that right of way from Alton to Cairo has been secured.

Pittsburg (Pa.) Underground Railway.—Representatives of the Pittsburg Subway Company, of which F. T. F. Lovejoy is president, have applied for an exclusive charter for a complete subway system in Pittsburg. The company failed to secure a franchise from the city council before April 11, when the exclusive rights under its former charter expired.

Terre Haute Robinson Olney & Southwestern Railway, Robinson, Ill.—Incorporated in Illinois to build an electric railway from a point on the Wabash river on the boundary line between Illinois and Indiana in a southwesterly direction through the counties of Crawford, Richland, Wayne and Jefferson, in Illinois, to Mt. Vernon. Capital stock, $10,000. Incorporators: Horace C. Pugh, H. P. Taussig, Norman H. Moss, W. H. Cisne, S. C. Wilson, George E. Parker and F. W. Lewis.

TRACK AND ROADWAY.

Asheville & Hendersonville Railroad, Asheville, N. C.—Surveys have been completed from Asheville to Hendersonville, N. C., 22 miles, on the line from Asheville to Greenville. Surveying was started last week between Hendersonville and Greenville and it is planned to begin construction this summer. The Carolina Construction Company of Asheville, of which J. S. Rowland is president, has the contract. (Noted March 21.)

Auburn & Northern Electric Railroad, Auburn, N. Y.—R. A. Dyer, Jr., assistant general manager, is reported to have announced that the line from Auburn to Port Byron, N. Y., will be opened for traffic by July 1. T. H. Mather of Syracuse is chief engineer. (Noted December 28, 1907.)

Auburn & Turner Railroad, Turner, Me.—H. B. Potter, general manager, writes that construction is to begin about May 1 on an extension from Turner Village to Turner Center, 2 miles. Contracts are to be let for 60-pound T-rails, cedar ties, trolley wire, bonds, etc.

Bloomington Pontiac & Joliet Electric Railway, Pontiac, Ill.—President H. A. Fisher has announced that grading on the extension from Pontiac south to Chenoa, Ill., 10 miles, will be started in a few days provided the $25,000 bond subscription asked of the residents of the territory to be benefited is secured. It is reported that most of the amount has already been subscribed. (Noted February 29.)

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—We are advised that bids are being received by J. C. Calisch, general manager, for a reinforced concrete viaduct to be erected at Westfield, N. Y. Plans were previously prepared by Boler & Hodge, consulting engineers, 1 Nassau street, New York City, for a structural steel viaduct, but it was later decided to receive bids on a reinforced structure also for cost comparison. The viaduct is to be 800 feet long, having a height of approximately 30 feet. Alternate bids for concrete arches and piers with center span of structural steel are also being received.

Chicago Kankakee & Champaign Electric Railway, Kankakee, Ill.—F. B. Venuum writes that this line has been surveyed from Kankakee to Champaign, Ill., and that grading will begin as soon as the bonds are placed. The officers are: President, I. F. Palmer, Onarga, Ill.; vice-president, Upton Schaub; chief engineer, Robert W. Renton, Kankakee, Ill. (Noted March 21.)

Chicago Ottumwa & Western Railway, Hamilton, Ia.—A. A. McGarry, president, writes that this company, recently incorporated, proposes to begin construction at an early date on its proposed line from Hamilton to Dallas, Ia., 24 miles, via Marysville. The overhead trolley system will be used. Surveys have been made. John A. Nelson, chief engineer. (Noted April 4.)

Chicago Railways Company.—Work has been started on the reconstruction of the tracks on Blue Island avenue from Halsted to Fourteenth street with 129-pound grooved rails.

Columbus Delaware & Marion Railway, Columbus, O.—It is announced that the extension from Marion to Bucyrus, O., will be completed in about 60 days.

Conestoga Traction Company, Lancaster Pa.—C. Edgar Titzel, general manager, writes that the report that this company was contemplating an extension from Marietta to Maytown, Pa., is erroneous, and that the company has no such intention. (Noted April 11.)

Diamond State Rapid Transit Company, Smyrna, Del.—J. W. Endean, chief engineer, writes that it is proposed to begin grading in about 30 days on the line from Delaware City to Rehoboth, Del., via St. Georges, Odessa, Smyrna, Dover, Camden, Magnolia, Frederica, Milford, Milton and Lewes, 96 miles. It is proposed to carry both passengers and freight. Maximum grade, 3 per cent; maximum curvature, 3 degrees. No rock excavation will be required. Contracts are to be let in about 45 days for the entire construction. The power house will be located at St. Georges. The equipment will include turbo-generator units to deliver three-phase current. Contracts are to be let for 72-pound rails, double-truck 4-motor cars seating 40 passengers and two Scherzer rolling lift bridges of 65-foot span. M. V. Ford is president. (Noted April 11.)

Fairmont & Clarksburg Traction Company, Fairmont, W. Va.—S. B. Miller, chief engineer, writes that surveys are being made for an extension from Grasseli to Bridgeport, two miles. Nothing definite has been decided yet as to the construction. (Noted April 18.)

Grand Central Traction Company, Indianapolis, Ind.—This company, which proposes to build an electric railway from Indianapolis to Evansville, Ind., with a branch from Bloomington to Terre Haute, has filed with the county recorder at Bloomington a mortgage for $8,000,000 in favor of the Chicago Title & Trust Company. W. D. Whitney of Muncie, Ind., is president. (Noted February 15.)

Illinois Central Electric Railway, Canton, Ill.—It is stated that the electrification of the line from Canton to St. David, Ill., six miles, heretofore operated with two gasoline motor cars, will be completed by May 1. The overhead construction, the material for which was furnished by the Ohio Brass Company, has been practically completed. G. W. Chandler, general manager.

Indianapolis Cloverdale & Terre Haute Traction Company, Indianapolis, Ind.—E. M. Bowman, president, writes that this

company, recently incorporated, proposes to begin construction about August 1 on its proposed line from Indianapolis to Terre Haute, Ind., via Mooresville, Eminence, Cloverdale, Polen, Asheville and Brazil. The right of way has been secured between Mooresville and Cloverdale. H. E. Sandusky is chief engineer. (Noted April 18.)

Jersey Central Traction Company, Keyport, N. J.—George I. Brown, vice-president, writes that this company proposes to build an extension from South Amboy to Perth Amboy, N. J., four miles, including a large amount of trestle work. A contract is to be let for pile driving for the trestle work. G. E. Desler, chief engineer. (Noted April 18.)

Joplin & Pittsburg Railway, Joplin, Mo.—A. L. Register & Co. of Philadelphia expect to award contracts within the next week for the laying of 25 miles of 70-pound rail between Joplin, Mo., and Pittsburg, Kan., also for the complete construction of the catenary and overhead lines between those points. Bids for this work will be received at the Joplin office of A. L. Register & Co., in the Miners Bank building. (Noted April 18.)

Kansas City & Olathe Electric Railway, Kansas City, Mo.—This company is now working on an extension from Merriam to Shawnee, Kan., two miles, which it expects to have in operation by May 1. An amusement park is to be located between Merriam and Shawnee. A line from Rosedale to Merriam, three miles, is now in operation. F. P. Dickson, president. (Noted October 26, 1907.)

Milwaukee Northern Railway, Cedarburg, Wis.—Construction has been started on an extension from Sixth street and Green Bay avenue, in Milwaukee, to Lindwurm park, on the Port Washington road. Ernest Gonzenbach, general manager.

Northwestern Pacific Railway, San Francisco, Cal.—This company's third-rail electric system has been extended from San Anselmo to Fairfax, Cal.

Pendleton, Ore.—Dr. Henry W. Coe of Portland, Ore., is said to be interested in a project to build an electric railway from Pendleton to Irrigon, Ore., via Echo, Foster, Hermiston and Umatilla, about 52 miles.

Shrewsbury, Pa.—J. H. Keller, secretary of a company that proposes to build an electric railway from York to Shrewsbury, Pa., 14 miles, writes that negotiations are now being made for securing a charter and right of way. Surveys have been made. D. B. Goodling of Logansville, Pa., is president and J. L. Meyers of Glen Rock, Pa., is treasurer. (Noted April 11.)

Springfield Clear Lake & Rochester Electric Railway, Springfield, Ill.—It is stated that this line from Springfield to Rochester and Hillsboro, Ill., is now being rapidly completed and it is expected that it will be in operation by May 1. J. E. Melick, president.

Stroudsburg & Water Gap Street Railway, Stroudsburg, Pa.—Henry Sweeny, vice-president, writes that a bridge over Pocono creek from Stroudsburg to South Stroudsburg on the line from Stroudsburg to Delaware Water Gap is now under construction and will be completed by May 15. Fine & Harris of Philadelphia are the contractors. (Note April 18.)

Texas Traction Company, Dallas, Tex.—This company, which expects to begin operating its line between Dallas and Sherman, Tex., by July 1, has laid its track into Dallas. (Noted April 18.)

Washington (D. C.) Railway & Electric Company.—This company proposes to build an extension comprising about 3,100 feet of single track. (Noted March 28.)

POWER HOUSES AND SUBSTATIONS.

Municipal Traction Company, Cleveland, O.—A. B. du Pont, president, has announced that the company has purchased two new engines and generators to furnish current for its railway lines. The engines will be built by the Allis-Chalmers Company and the generators by the General Electric Company.

New Jersey & Pennsylvania Traction Company, Trenton, N. J.—This company has contracted with the Allis-Chalmers Company for a heavy duty cross compound engine with cylinders 24 and 48 by 42 inches, to drive an 800-kilowatt alternating-current generator. The order also includes a 35-kilowatt induction motor-driven exciting unit, which will be installed with the alternator in the power station at Yardley, Bucks county, Pennsylvania. (Noted February 8.)

United Railways Company of St. Louis.—In the president's annual report to this company it is stated that three 800-kilowatt generators, heretofore operated in the Cass avenue power station, will be reconstructed and later installed in the North Broadway and the De Hodiamont power stations.

Personal Mention

Mr. C. M. Crawford, heretofore chief engineer of the Cincinnati Northern Traction Company at Hamilton, O., has resigned.

Mr. A. C. Ogelby, chief engineer of the Grand Rapids (Mich.) Railway, has resigned to take a position with an electric railway system in the south.

Mr. R. W. Brown, heretofore superintendent of the Toledo & Western Railroad at Adrian, Mich., has resigned to accept a position in the train dispatching department of the Detroit United Railway.

Mr. Hugh McCloskey of New Orleans, La., heretofore chairman of the board of directors, was elected president of the New Orleans Railway & Light Company at a meeting of the directors held last week, succeeding Mr. E. C. Foster, who was elected first vice-president.

Mr. J. B. Lukes, whose appointment as district superintendent of power for the Stone & Webster properties in the Puget Sound district was announced in the Electric Railway Review of April 11, was born in Racine, Wis. He graduated from the electrical engineering department of the Massachusetts Institute of Technology of Boston, Mass., in 1892, and was first employed in the inspection and later in the contract department of the Chicago Edison Company. While in Chicago he also was employed by the board of directors of the Chicago public library to take charge of the electrical installation in the public library building. After completing this work he accepted a position with the United States Electric Lighting Company of Washington, D. C., where he remained until August, 1900, when he resigned to become superintendent of light and power of the Seattle Electric Company at Seattle, Wash. In March, 1906, he was made general superintendent of the company and on April 1, 1908, received his present appointment as district superintendent of the Stone & Webster properties in the Puget Sound district.

J. B. Lukes.

Mr. Joseph E. Wayne, heretofore general superintendent of the York Railways at York, Pa., has resigned, effective on May 1, to become general manager of the Chambersburg Greencastle & Waynesboro Street Railway and the electric light plant operated by the company at Waynesboro, Pa.

Mr. J. Boyle Price, purchasing agent of the United Railways Company of St. Louis, has resigned to become vice-president of the J. O. Chenoweth Dyeing & Cleaning Company of St. Louis. Mr. Price had been connected with the St. Louis system for 14 years. No successor will be appointed.

Mr. George L. Collins has been appointed manager of the Ontario Light & Traction Company, Canandaigua, N. Y., succeeding Mr. R. M. Searle; effective on May 1. Mr. Collins formerly was general manager of the Consolidated Gas & Electric Company of Batavia, N. Y.

Mr. W. B. Atwood has been appointed assistant superintendent of the Ashtabula Rapid Transit Company, Ashtabula, O., with entire charge of the reconstruction work contemplated by the company. Mr. Atwood formerly was with the Keystone Construction Company and more recently with the construction department of the Ohio Electric Railway at Lima, O.

Mr. John B. Olmstead of Buffalo, N. Y., has been appointed a member of the public service commission of New York, second district, succeeding Mr. Charles Hallam Keep, resigned to become president of the Knickerbocker Trust Company of New York City, as announced in a previous issue. Mr. Olmstead was born in Leroy, N. Y., in 1854. He is a graduate of Harvard University and studied for two years

in Heidelberg University. He was admitted to the bar in 1879. He was formerly a member of the civil service commission of Buffalo and later became treasurer of the Buffalo Civil Service Reform Association, which office he now holds. His term of office will expire on February 1, 1912.

Mr. Samuel Anderson has succeeded Mr. Horatio Bigelow as superintendent of the Connecticut Company's lines in eastern Connecticut, with headquarters at Norwich. His jurisdiction will extend over the district between New London on the south and the state line on the north, comprising 105 miles of road.

Miss R. Boydland, for the past year general accountant of the Grand Rapids Grand Haven & Muskegon Railway, Grand Rapids, Mich., has been appointed auditor of the company. Miss Boydland entered the service of the company as stenographer about four years ago and succeeded Mr. S. L. Vaughan as general accountant last April when he was appointed traffic manager.

Mr. Bernard C. Cobb has been elected vice-president of the Saginaw-Bay City Railway & Light Company, Saginaw, Mich., succeeding Mr. S. E. Wolff, whose resignation as vice-president and general manager was announced in the Electric Railway Review of April 11. Mr. H. T. Wicks has been elected second vice-president. Mr. E. C. Folsom, heretofore superintendent of the company, has resigned, and Mr. J. F. Collins, who was recently appointed general manager to succeed Mr. Wolff, will combine the duties of superintendent and general manager.

Mr. A. H. Hayward, vice-president of the York Railways Company, York, Pa., has resigned; effective on May 1. He was appointed general manager of the York County Traction Company in January, 1905, and held that position until elected vice-president of that company and the York Street Railway. Mr. David Young, Jr., being appointed general manager to succeed him. Mr. Hayward formerly was general manager of the Lehigh Valley Transit Company at Allentown, Pa., and later was general superintendent of the Dayton Springfield & Urbana Electric Railway at Springfield, O. He also was at one time superintendent of the City Railway at Dayton, O.

Mr. Henry Donovan, whose resignation as master mechanic of the Washington Baltimore & Annapolis Electric Railway was announced in the Electric Railway Review of April 11, had been connected with the road during its construction. He began railway work in the mechanical departments of the Brooklyn Rapid Transit Company and the Manhattan Elevated Railroad, remaining with the latter company and the Interborough Rapid Transit Company for five years. He later was appointed master mechanic of the New Jersey & Hudson River Railway & Ferry Company of Edgewater, N. J., resigning after two years to accept a similar position with the Washington Baltimore & Annapolis Electric Railway. As earlier announced he will be succeeded by Mr. T. M. Childs, formerly of the General Electric Company.

OBITUARY.

John M. Haldenwang, for 15 years superintendent of the southern district of the Brooklyn City Railroad, died recently at the age of 71 years.

Charles A. Murphey, one of the promoters of the Key West Electric Company, Key West, Fla., is dead. He was a well-known lawyer of New York City and a former president of the Brooklyn Heights Improvement Company.

Financial News

Chicago Railways Company.—Organization has been completed by the election of the following directors: Henry A. Blair, chairman, John M. Roach, Frederick H. Rawson, W. M. Eisendrath, Hempstead Washburne, A. B. Jones, John W. Gary and Wallace Heckman.

Coney Island & Brooklyn Railroad, New York.—Application has been made to the New York public service commission, first district, for approval of an issue of $162,000 of consolidated mortgage bonds. The proceeds are to be used to pay for reconstruction of the line from Prospect Park to Coney Island, the purchase of new cars and the construction of a new power plant.

Forest City Railway, Cleveland, O.—Stockholders have voted to increase the capital stock from $2,000,000 to $6,000,000.

Illinois Traction Company, Champaign, Ill.—It is rumored that the Canadian stockholders will sell control of this property to an English syndicate.

Interborough-Metropolitan Company, New York.—J. P. Morgan & Co. of New York are negotiating for the purchase of $25,000,000 of 3-year notes.

Paris (Ill.) Traction Company.—Earnings from May 25, 1907, to February 1, 1908, were as follows: Earnings from passengers, $14,871.26; earnings from other sources, $500; gross income, $15,371.26; operating expense, $6,924.53; net income, $8,446.73.

Plymouth Carver & Wareham Street Railway.—Stockholders have voted to wind up the affairs of the company. The company was organized in December, 1903, to build a railway from Plymouth through Carver to Tremont and Wareham, Mass., but construction was not started. Stockholders will receive 75 per cent of the cost of their stock.

Rochester (N. Y.) Railway & Light Company.—Application has been made to the New York public service commission, second district, for approval of an issue of $1,474,000 of 5 per cent bonds to refund outstanding obligations.

Toledo & Chicago Interurban Railway, Kendallville, Ind.—James D. Mortimer, the receiver, has been authorized by Judge Heaton of the Allen county circuit court, Kendallville, to spend $65,000 for improvements in track.

Dividends Declared.

East St. Louis & Suburban Company, East St. Louis, Ill., preferred, quarterly, 1¼ per cent.

Georgia Railway & Electric Company, Atlanta, Ga., preferred, quarterly, 1¼ per cent.

Grand Rapids (Mich.) Railway, preferred, quarterly, 1¼ per cent.

Twin City Rapid Transit Company, Minneapolis, Minn., common, quarterly, 1¼ per cent.

Lincoln (Neb.) Traction Company, common, 4 per cent.

Milwaukee Electric Railway & Light Company, common and preferred, quarterly, 1½ per cent.

Montreal Street Railway, quarterly, 2½ per cent.

West Penn Railways, Pittsburg, preferred, quarterly, 1¼ per cent.

Manufactures and Supplies

ROLLING STOCK.

Washington Railway & Electric Company, Washington, D. C., is in the market for one interurban car.

Diamond State Rapid Transit Company, Smyrna, Del., under construction, will buy a number of interurban cars.

Union Traction Company, Santa Cruz, Cal., is reported to have placed an order for four double-truck motor cars and two trailers.

Grand Central Traction Company, which was reported in the Electric Railway Review for April 18 to be in the market for a number of interurban cars, will place an order for 20.

Chicago Railways has placed an order with the Pullman Company for trucks for the 300 cars ordered recently from that company and for the 50 all-steel cars to be built by the Pressed Steel Car Company. The contract for the air brakes was awarded to the National Brake & Electric Company, Milwaukee.

Des Moines City Railway, Des Moines, Ia., has remodeled one of its cars so that the pay-as-you-enter system of fare collection may be used on it. It is stated that the company will adopt the type generally if the experiment proves successful.

Chicago Lake Shore & South Bend Railway, South Bend, Ind., which was reported in the Electric Railway Review for March 21 to be in the market for four double-truck cars, has placed an order with the G. C. Kuhlman Car Company for two interurban cars.

TRADE NOTES.

R. W. Marshall & Co., New York, have moved their offices from 93-97 Liberty street to the Hudson Terminals.

American Locomotive Company, New York, has moved its general offices to the Hudson Terminals, Cortlandt building.

McGuire-Cummings Manufacturing Company, Chicago, has moved its New York office from 42 Broadway to 32 Broadway.

Lorain Steel Company's sales office has been moved from 74 Broadway, New York, to the Hudson Terminals, 30 Church street.

National Tube Company, Pittsburg, has moved its New York office from Battery Park building to the Hudson Terminals.

J. A. Venable has been appointed general manager of the New York Car Wheel Company, Buffalo, N. Y., succeeding P. H. Griffin, resigned.

Dielectric Manufacturing Company, St. Louis, has increased its working capital to $40,000. The company manufactures electrical insulating materials exclusively.

Vulcan Iron Works Company, Toledo, O., in order to make its corporate name more fully indicative of its principal business, has changed it to the Vulcan Steam Shovel Company.

Nebraska Electrical Trades Exposition Company, Omaha, Neb., is now making reservations of exhibit space for the first annual electrical show, to be held at the Omaha Auditorium, May 4 to 9. J. M. Gillan, manager.

A. L. Whipple has resigned as second vice-president of the Telharmonic Securities Company, New York, and will re-enter the railway supply business. Mr. Whipple was formerly eastern manager of the Curtain Supply Company, Chicago.

J. S. Lehman, formerly general lamp agent at St. Louis for the Westinghouse Electric & Manufacturing Company, has been appointed agent for the Moline Incandescent Lamp Company, Moline, Ill. Mr. Lehman's headquarters are in the Security Trust building, St. Louis.

Westinghouse Electric & Manufacturing Company's executive offices and New York sales and export offices were moved on April 20 from 11 Pine street to the City Investing building, 165 Broadway. The New York offices of the Westinghouse Air Brake Company were also moved to the same building.

General Electric Company's New York offices have been moved from the Edison building, 44 Broad street, to the Hudson Terminals, Cortlandt building, 30 Church street. Approximately 31,000 square feet, or the entire seventeenth floor of the Cortlandt building, will be occupied by the General Electric Company.

John Lucas & Co., Philadelphia, have purchased a plant at Sixteenth and Morgan streets, Chicago, and are now installing machinery for the manufacture of paints. Harry C. Quest, formerly with the Heath & Milligan Manufacturing Company, is in charge of the railway sales department of John Lucas & Co., with offices at 708 Marquette building, Chicago.

Barney & Smith Car Company, Dayton, O., on April 10 gave a dinner to all its employes who had been in the company's service for 25 years or more. There were present 178 men who met this qualification. A. M. Kittredge, vice-president of the company, presided. Among the guests and speakers was George A. Post, president of the Standard Coupler Company, New York.

Horatio A. Foster, resident engineer in Baltimore for L. B. Stillwell, has been transferred to the New York office, 100 Broadway. He will still continue to look after the work in Baltimore, sharing this supervision with H. S. Putnam on electrical work and with Mr. Van Vleck on the steam end. Mr. Foster has been in charge of the work in Baltimore since it was started a year and a half ago, and has carried through to completion the many additions and changes made to the power plants of the United Railways & Electric Company, under the contract with Mr. Stillwell. These included the construction of a power station at Bay Shore, a new summer resort; a new substation in the central part of the city; an addition to one of the outlying substations; rearranging and reinforcing of three existing substations, and the construction and reconstruction of the Pratt street power station. During this period of building the operation of all power plants came under his supervision and the forces were all thoroughly reorganized.

The J. G. Brill Company, Philadelphia, on April 1 acquired the plant of the Danville Car Company, Danville, Ill., and is continuing the business without change of name. The Danville plant was completed early last year and is entirely modern in construction and equipment. A description of the plant was published in the Electric Railway Review of August 17, 1907. The company will build electric railway cars of all types, as well as trucks, steam coaches, freight cars and electric locomotives. It will also make a specialty of building and repairing steel cars. The following officers have been elected: Samuel Curwen, president; George H. Tontrup, vice-president and manager of the sales department; H. F. Vogel, general manager; and Edward P. Rawle, treasurer. Mr. Curwen was also recently elected a director and vice-president of The J. G. Brill Company, succeeding the late John A. Brill. The J. G. Brill Company now controls the following plants: American Car Company, St. Louis; G. C. Kuhlman Company, Cleveland; John Stephenson Company, Elizabeth, N. J.; Wason Manufacturing Company, Springfield, Mass.; Danville Car Company, Danville, Ill.

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

Woolley Electric Company, 811 North Second Street, St. Louis, Mo.—A neat illustrated price list of B-P inclosed fuses has been issued.

H. W. Johns-Manville Company, 100 William Street, New York, N. Y.—Recent circulars include No. 7661, descriptive of the J-M national steel boiler tube cleaner, and No. 7705, devoted to Vulcabeston packings.

B. B. Hill Manufacturing Company, 1016 New Market Street, Philadelphia, Pa.—A brief descriptive catalogue of railroad stamping devices has been issued which includes information regarding an improved model of the Centennial dater and a new model stub cutter and dater for the larger and union ticket offices.

Alexander Milburn Company, 507 West Lombard Street, Baltimore, Md.—Catalogue E describes in detail and illustrates the Milburn light for contractors, engineers and railways. Features of simplicity, economy, efficiency and mobility are considered and lights designed for particular services, such as railroad wrecking work, underground excavation, etc., are shown.

Railroad Supply Company, Chicago, Ill.—Section No. 4 of signal department catalogue No. 7 has just been issued. It shows various styles of lightning arresters, designed for both direct and alternating current. The catalogue also describes various methods of lightning arrester application, ground plates, ground rods and water and fire proof boxes for arresters.

Expanded Metal & Corrugated Bar Company, St. Louis, Mo.—A catalogue measuring 8½ by 10½ inches and contain-

ing 114 pages and cover is devoted to the subject of "Corrugated Bars for Reinforced Concrete Construction." It has a fund of valuable information and a great many interesting illustrations, those of railway construction being especially interesting.

Coates Clipper Manufacturing Company, Worcester, Mass.—A recently issued catalogue is devoted to the Coates system of unit-link flexible transmission. An important feature is the description of a new transmission head, which transmits power from a drill press, lathe or any other power driven tool, and utilizes it for drilling, bulling, grinding, etc. This does away with the expense of motor or other special drive and permits the use of portable tools in any portion of a shop where a power-driven tool is located. The catalogue is from the press of Mugford & Co., Hartford, Conn.

More-Jones Brass & Metal Company, St. Louis, Mo.—A new catalogue has just been issued descriptive of the More-Jones line of metals, babbitt metals, brasses, bronzes, brass bronze and aluminum castings, bearings and bearing specialties, crucibles, solders, etc. The book is fully illustrated, contains 244 pages and has a green cloth cover stamped in red and black.

E. S. Jackman & Co., 164 West Lake Street, Chicago.—An unusually handsome and well written booklet descriptive of the Firth-Sterling Steel Company's special tool steel and blue chip high-speed steel, comes from the steel company's Chicago agents. A brief sketch of the discovery, development, forms and uses of blue chip high-speed steel is given, together with instructions on hardening and tempering it.

Standard Varnish Works, 29 Broadway, New York, N. Y.—A folder attractive in appearance and text places this concern's various departments at the command of customers for any service it may be practical to render. Included most particularly is its architectural department, "in which are men competent to give technical information, to make tests and to prepare samples and exhibits of materials conceived for special or extraordinary purposes."

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1502 describes the test of the steam engines comprising the power plant of the New York subway system. There are nine engines, each rated at 8,000 horsepower, but the actual capacity is 12,000 horsepower. The plant is equal to the power of six such vessels as the Connecticut, flagship of the new Pacific fleet, with 4,500 horsepower to spare. The combined engine power of three or four leviathans of the deep, like the Kaiser Wilhelm II, the Oceanic and the new turbine steamers built for the Cunard line, would be required to equal the power of the New York subways. Measured in electrical terms, the daily average output of the nine engines is about 800,000 kilowatt-hours. One thousand tons of coal and 1,800,000 gallons of water, or enough to supply the needs of a city of 30,000 to 40,000 inhabitants, are required daily. Naturally the outcome of a test of an installation of this magnitude is of unusual interest.

GIBBS TRAIN-INDICATING DEVICE.

We present in the accompanying illustrations views of a "train indicating" device which has been developed by W. A. Gibbs, district manager Ohio Electric Railway, Columbus, O., and for which manufacturing arrangements have been made. We quote Mr. Gibbs' own description and claims made for this device:

The train-indicating device provides a simple and easy means for carrying train numbers on cars. As we are operating at present and as most roads of like character are operating, we have no indication whatever to show crews of trains meeting at a designated passing point what the opposing train represents. We go to a great deal of pains and trouble to get out elaborate timetables and specify trains by numbers, making them pass at certain points at certain times. In issuing special orders we very often use car numbers, but if anything happens to the car it is likely to be displaced by another car instead of the one specified as put out on the run.

In case of an extra train we issue orders to the men and depend on their putting up proper classification signals. Should they fail to do this, however, and be met by an opposing train on a passing point shown by the timetable, the crew of the opposing train would be perfectly right in considering them to be the train to be passed.

In case of trains running in sections, should the proper signals not be displayed, or in either of these cases should the signal lights go out after dark, a misunderstanding would result which could be attributed to nothing but the fault of the method of operation.

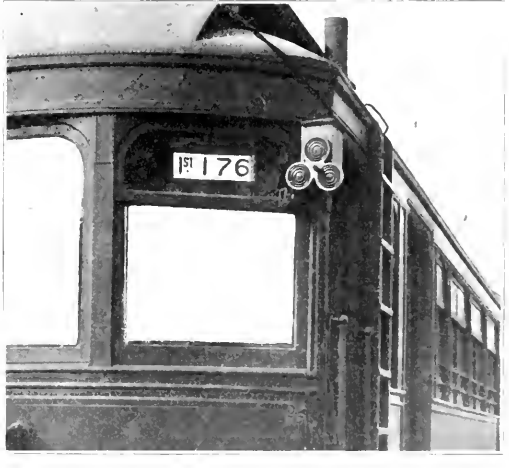
Misunderstandings regarding trains also occur quite often in yards where trains not shown on the timetable are against which special orders need not be given but be operating on certain tracks.

It seems, therefore, that in order to identify a car or train train with the timetable it is necessary to carry train numbers. This can be done in various ways. But electric cars especially have so many different train numbers in a day that none of the methods that have been used seemed adaptable to the purpose because they were too cumbersome and because of the liability of a car not having the proper train numbers on it when it went into service. My object in designing the new

Gibbs Train-Indicating Device—Rear View with Cover Raised.

device was to provide a simple and easy means for showing train numbers on cars that would be complete in itself and a part of the car. I therefore developed the device which consists of separate ribbon rollers, as shown by the engravings.

Each ribbon has the numbers from 1 to 0 printed on it, as well as a blank space, so that no number need be shown



Gibbs Train-Indicating Device—View as Installed in Car.

if it is not desired. The four ribbons, when properly set, display the word "Extra," to be used on extra trains which do not have train numbers. Each ribbon is operated separately. Any combination of numbers up to 999 can be had with the three ribbons. The fourth one I have used to specify sections of trains that may consist of more than one section.

The superiority of this method obtains because if the train number is not right it is wrong, and consequently if it is not right the opposing train will not have the right to proceed. Thus it is impossible to have any misunderstanding

in connection with the device in case the trainmen neglect to set it properly.

With the cover raised and as viewed from the platform the numbers appear upside down. It is easy for the operator to see through the strips and adjust the numbers from the back of the box and also see what numbers he has up. The device is shown as installed in one of the Columbus-Zanesville limited cars on the Ohio Electric Railway Company's line.

Lights are provided in the box and, the strips being transparent, the numbers are as easily distinguished by night as by day

NATIONAL AIR BRAKES FOR CHICAGO RAILWAYS COMPANY.

The Chicago Railways Company, which owns all of the north and west side street railways in the city of Chicago, has just awarded a contract to the National Brake & Electric Company, Milwaukee, Wis., to furnish all of the air brake apparatus for the 1,200 new cars which, in accordance with the traction ordinance, it will purchase and place in service within the next three years.

The Chicago Railways Company expects to put about 550 new cars into service this summer, orders for 400 cars having already been placed with the Pullman Company and the Pressed Steel Car Company. This contract covers a larger number of air brakes than has ever before been contracted for by any electric railway company and is significant of the merits and reputation of the product of the National Brake & Electric Company, which has already supplied a large number of its National air brakes to both the Chicago City Railway Company, operating the south side lines, and the Chicago Union Traction Company, now the Chicago Railways Company

GEARS FOR ELECTRIC TRAVELING CRANES.

The experience of a large manufacturing establishment having heavy overhead traveling cranes has been rather unsatisfactory because of the breaking of the teeth of the gray iron gears and pinions with which the crane machinery was

Gears for Electric Traveling Cranes.

fitted, the last breakage of gear teeth resulting in putting the crane out of service for some weeks until a portion of it could be rebuilt and steel gears applied.

Other crane users have found that the severe service causes even steel gears to wear rapidly, and that failures are frequent because of worn teeth. A material which has been found to be more durable for gears is manganese steel, and at the shops referred to all the cranes have been or are being equipped with manganese steel gears and pinions, for which a life fully five times as long as that of cut tooth gears and pinions made of another grade of steel is reported.

This longer life of gears means a great saving in locomotive, car and other shops having overhead electric traveling cranes, and also in steel mills, foundries and factories making heavy machinery of any kind where gears are used.

The manganese steel gears and pinions, besides being economical for this class of service, have shown in the last few years a great economy when used in electric railway motors.

On the score of economy it is claimed that a manganese steel gear running with a manganese steel pinion will outwear at least five of the cut tooth type of gear, and that in addition there are savings in the labor required for replacements and in keeping the equipment longer in service; the amount of noise is also reduced.

The Atha Steel Casting Company of Newark, N. J., is the exclusive maker of manganese steel gears and pinions, and will be pleased to furnish full information regarding methods of manufacture, sizes, service and cost of gears and pinions, on application to the general office, or any one of its branch offices, which are located in Boston, Mass., Board of Trade building; Richmond, Va., American National Bank building; Cleveland, O., Caxton building; Chicago, Railway Exchange.

Bulletin No. 3, published recently, gives full information concerning these gears.

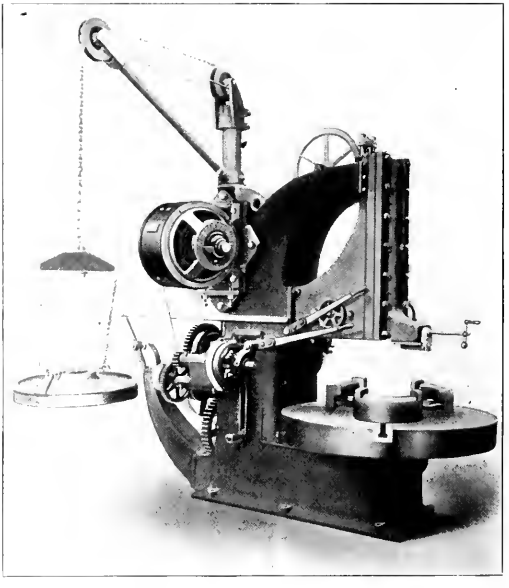
IMPROVED MOTOR-DRIVEN CAR WHEEL BORING MILL.

The accompanying illustration shows a late type of motor-driven car wheel boring mill, with improved automatic chuck, friction feed discs and crane attachment. It is a 54-inch machine and its heavy construction and powerful gearing render it capable of taking the heaviest cuts required for this class of work.

The automatic chuck is self-closing, self-opening and self-centering. It has three adjustable abutments, each provided with an equalizing steel jaw with two bearing points. The work is thus held and centered by six points on the circumference, insuring accuracy in centering.

The first movement of the driving shaft causes the jaws to close upon the work, after which the motion is transmitted to the table to produce rotation. When the boring is completed, the chuck is released by disengaging the driving clutch and retarding the driving shaft by means of the friction brake provided for the purpose. The inertia of the table and work thus imparts the necessary force to open the jaws.

The work is secured in its correct position in the machine



Improved Motor-Driven Car Wheel Boring Mill.

and released with no loss of time and without labor. Since the power of the clutch grip increases with the resistance of the cut, it is never necessary to stop the table to tighten the chuck.

The boring mill is especially arranged for electric drive and the motor is mounted on the vertical housing of the frame. The motor is a Westinghouse type S for a variation in speed of approximately two to one, and therefore eliminates the cone pulley required by line shaft drive. This increases the machine capacity because the variable speed motor gives the desired range of speed in much smaller steps, permitting the mill to be run at all times at its maximum. The boring mill is manufactured by William Sellers & Co., Inc., Philadelphia.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Expert street car electrician, city or interurban lines, desires a change. Fifteen years' experience; capable handling men; also railway park manager. Now with a large railway. Address "No. 578," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 585," care of Electric Railway Review, Chicago.

Wanted—Position as superintendent of rolling stock or master mechanic on city or interurban railway. Have satisfactorily handled similar work on large metropolitan properties since horse car days. At liberty now; references exceptional. Address "No. 580," care of Electric Railway Review, Chicago.

Position wanted with a proposed interurban electric road by a man with eight years' experience in the preliminary work. Can take complete charge of the engineering work, procuring right of way, franchises, stock selling; and also knows the conditions which must exist before a road can be successfully financed. Address "No. 584," care of Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

Wanted — Middle-aged man with 26 years' experience in railway operation and supplies and equipment wants to represent good firms in the southwest, with headquarters at Oklahoma City. (By permission refers to Electric Railway Review.) Address "No. 581," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Transportation man of seventeen years' experience, young, reliable and thoroughly familiar with organization, dispatching and timetable work, desires a position as superintendent or one of equal responsibility. Highest references regarding character, ability and past service. Address replies to "No. 577," care Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Position wanted as superintendent and electricinn of electric light and power station by man of 30, having 12 years' practical experience in construction and operation; thoroughly familiar with all systems adopted by modern plants for reducing expenses and adding to income; salary, $125. Address W. N. Alexander, Sidney, Neb.

Detective or claim agent—Three years' experience in the detective business. Used to rough, hard electrical and street railway work. Address "No. 585," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Superintendents, engineers, draftsmen, street railway, electrical, mechanical. Positions open. Write for free list and information, HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

BOOKS AND PUBLICATIONS.

Wanted—Copies of Street Railway Review, January to June, 1906, inclusive, and one copy each January and February, 1906. Also Electric Railway Review for January 5, 1907. State condition and price. Address "No. 582," care of Electric Railway Review, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

Canada, 3.50

Announcement is published in this issue of the Electric Railway Review that a revision will be made in the scheme of division between large and small electric railways in the interstate commerce commission accounting system. The circular issued by the commission, presenting for criticism classifications of operating expenses and construction expenditures, fixed $50,000 gross annual revenue as the line of demarkation which should determine whether a company should use the amplified classification of operating expense accounts or an abbreviated classification containing the same principles. The naming of this small sum, even tentatively, has been generally criticized by all who are familiar with the abnormal accounting expenditure which a classification of operating expenses containing 116 primary accounts would impose upon a large number of railways. That the determination upon the revision of this feature of the tentative system has already been made is evidence that the division of statistics and accounts of the commission recognizes the justice of the complaints which have been received concerning the limit suggested.

Revision of Line Fixing Small Railways.

The use of mirrors on the fronts of cars is not a new practice. Several city roads in the central west have used such mirrors for years. Originally they were put on small single-truck cars which did not handle enough traffic to warrant the expense for crews of two men. With a mirror over his head the motorman could easily watch the passengers in his car and make sure which had paid fares. As the cars used became larger and full crews were required some of the roads found it advisable to use mirrors mounted on a vestibule post so that a motorman could watch the rear step and the ears following. So large a system as the Omaha & Council Bluffs Street Railway makes good use of mirrors on its cars. This company, profiting by the successful use of such mirrors in Des Moines, has installed them on its closed cars and will put them on the open cars for summer use. As stated by Arthur W. Gross, claim agent of the Omaha company, one of the most important reasons why mirrors are used is that they help in preventing a large number of accidents which otherwise would occur at the rear steps of a closed car or along the running board of an open car.

Mirrors for the Motormen.

The general manager of a railway property in a moderate sized city has tasks to fulfill that are entirely without the province of the manager of a metropolitan railway. He and the head of his transportation department must know when and where all public meetings are to be held and must be in close touch with the affairs of the entire city. This is too large a task for any one or two men on a very large property. No comparatively small railway can afford to be without a manager who is a good "mixer." The manager of a 20-mile street railway serving a city in the middle west which has a population of 45,000, recently stated that he followed a systematic plan of getting acquainted with a number of the more prominent men in the trade unions, professions and mercantile businesses in his city, with a friend or two in the various fraternal and church organizations. Being on good terms with the leaders of these bodies serves him in good stead. One can readily appreciate the value of his policy whenever political moves are agitated which may not be in accord with the best interests of the railway. A most valuable asset for an electric railway is a friendly relation with its patrons.

Relations with the Public.

At Des Moines last week the members of the Iowa Street and Interurban Railway Association discussed in a very thorough manner the subject of depreciation in electric railway accounting. This discussion resulted in a far better understanding of the question than that previously had by many of the members. Doing things by halves is not a characteristic of the Iowa association; therefore the members put themselves on record with regard to the depreciation question by passing a resolution embodying the following statements: "Resolved, That the Iowa Street and Interurban Railway Association recognizes the correctness of the principle of providing out of earnings an adequate annual appropriation for a depreciation reserve; said depreciation reserve account to be separate and distinct from any maintenance account. The funds so appropriated to be used solely for the purpose of paying for renewals of equipment worn out in service or superseded by advances in the art." The committee which formulated this resolution also recommended that all member companies should make public their financial statements at least once each year. The recommendation is based on the following reasons: "1. To correct the erroneous idea on the part of the public that the business is productive of excessive profits. 2. A true exposition of the net returns to security holders will to a large extent still the clamor for short-term franchises and reductions in fares and rates. 3. The public is disposed to be fair-minded and if it has access to our reports and realizes the close margin of profit in the electric railway business much of the effectiveness of the doctrines of the demagogues will be lost." From our knowledge of the men who operate the Iowa properties we believe that they are serious in this matter and therefore will use their best efforts to carry out these resolutions.

Depreciation and Publicity in Iowa.

Tom L. Johnson has finally won his long fight with the Cleveland Electric Railway and has caused the introduction of 3-cent fares in Cleveland. As yet the 3-cent fare does not include transfers, but we are assured that they will be ready in a few days. A settlement of the long controversy, with its accompaniment of costly lawsuits, track ripping and consequent impairment of service, is of course entirely satisfactory to the people of Cleveland on almost any terms, and the inauguration of the new regime on Tuesday by giving free rides of course did a great deal to increase Mr. Johnson's popularity in Cleveland. At the same time the success of the holding company plan, which is outlined on another page of this issue, remains to be demonstrated. The Municipal Traction Company, composed of nine men supposed to represent the public and to operate the property without profit to themselves, is starting

Three-Cent Fares in Cleveland.

out with some very ambitious plans, but we believe that conservative street railway managers will wish to observe its operations for some time before following its example. Mayor Johnson has apparently assumed control of a large street railway system without paying anything for it and we fail to find any guarantee as to how long the 3-cent fare system will last or any indication as to where the 2-cent saving is to be effected. We are told that the holding company is to operate without profit, but those who furnish the capital for improvements and extensions will expect dividends, fixed charges are not reduced and we know of no documentary limitation of the salaries to be paid to the officers. Possibly a directorate composed largely of politicians can manage a street railway more economically than experienced railway men, but 40 per cent is a big reduction and the experiment will be watched with great interest.

BALTIMORE BULLETINS AND OVERCAPITALIZATION.

During the past few months we have several times called attention to the very excellent publicity campaign which the United Railways & Electric Company of Baltimore is carrying on through the medium of the daily press in that city. The most recent bulletin discusses the subject of "capitalization." Former bulletins have presented to the railway patrons in Baltimore especially well-written discussions of such subjects as transfers, cleanliness, the street railway as a developing agent, taxation, power and accidents. We are informed that the results of this campaign are especially gratifying to the street railway management.

Each week one of the department heads prepares a clearly written discussion on the relations which do or should exist between his department and the patrons of the road. These discussions are entirely original and, not being in the nature of advertisements, become interesting reading for the subscribers to the large daily papers of Baltimore in which the articles appear. It is understood, of course, that the primary reason for conducting this publicity campaign is the good which eventually will accrue to the United Railways & Electric Company. Therefore a generous amount of advertising space for the presentation of the company's arguments is purchased from the daily press each week.

The latest bulletin on "capitalization" presents this broad subject in such a clear, concise way that the financial foundation of the railway can be better understood by those inhabitants of Baltimore who, unless so informed, might be persistent and vigorous in their denunciation of this public service corporation, because of their belief that it may be "overcapitalized."

The principle of comparison also serves as a powerful argument. With the purpose in view of showing that the capitalization of the United Railways & Electric Company is much lower than in other large cities, a table is presented showing that this company is capitalized (bonds and stock) for $21,907 less per mile than Pittsburg, Pa.; $41,466 less per mile than St. Louis, Mo.; $86,568 less per mile than Chicago, Ill. (Chicago Union Traction); $129,625 less per mile than Richmond, Va.; $131,814 less per mile than Brooklyn, N. Y.; $139,146 less per mile than Washington, D. C.; $312,390 less per mile than New York (Manhattan). [Where there are two or more companies in a city the one having the greatest length of track is here given.]

In defining "overcapitalization" the man who uses the quoted expression means to convey the impression that if a railway property were destroyed it could be reproduced at less than the par value of its present capitalization. This statement is entirely correct as far as it goes, and while it sounds plausible to those unfamiliar with railway problems it is both illogical and unfair.

The Baltimore bulletin considers some of the many factors other than those of present value, which must necessarily exist as a part of the present capitalization of street railways.

"Ever since the introduction of electricity there has been no cessation in the onward march. Electric cars purchased 10 years ago, 16 feet long, have found their way to the scrap heap. To meet the rush-hour problem 31-foot cars have taken their places. With the heavier cars came the necessity for laying heavier rails, and with additional demand for power came the necessity for the immense modern power house. The progress of electrical improvement has been one of the wonders of the past decade, and machinery purchased with an estimated life of 20 years has been replaced by new inventions and has found its way in a brief period to the scrap heap."

A special report of the United States census office covering operations of electric railways for a period as long ago as 1902 emphasizes the fact, sometimes overlooked, that the existing equipment of the old-fashioned horse and cable railways practically all had to be scrapped when electric traction was introduced. In most of these rehabilitation undertakings the cost of the new system was nearly as great as it would have been had there been no existing property to be rebuilt. On this subject Bion J. Arnold, in his report to the transportation committee of the Chicago city council, said that it would cost nearly as much to convert the cable lines to underground trolley systems as to construct the latter at first hand.

Reconstruction of railways operated with out-of-date materials and methods is thus seen to form an important factor in the large capitalization so frequently criticized.

A second factor, and by no means an unimportant one, is the cost of consolidations. On this subject the bulletin of the United Railways & Electric Company has the following to say:

"For example, if a street railway company in the early days earned sufficient income to pay large dividends its stock would sell at much over par. When it was seen that economies could be introduced by combination, the companies could not be purchased for such a mythical thing as the 'cost of reproduction.' The market value of the stock at least had to be paid. Again, the cities granted competing franchises which eventually forced one company to buy out the other, paying a high nuisance value, which in no sense represented the mere 'cost of reproduction.' The bankers and syndicates who took the financial risk of purchasing securities, of guaranteeing security holders, underwriters, etc., frequently received their compensation in stock. No one will fairly deny that they were entitled to payment for their risk in supplying or guaranteeing capital, provided they were not overpaid."

This factor is the one most frequently emphasized, but, as a matter of fact, constitutes much the smallest element in the capitalization of the companies.

In extenuation of its arguments that an injury can be brought upon the company by overtaxation, which injury is retroactive and results in throttling the service offered, the United Railways & Electric Company states that it "has not only never paid a cent to its stockholders, but, since the great fire, even its income bondholders have received no cash, but have been obliged to accept their interest in deferred obligations. At the same time the company has paid to the city and state more taxes proportionately than any other street railway in the country."

After presenting these clear explanations of why the capitalization of an electric railway must be so much greater than the actual cost of reproduction there is fittingly given a summary of the benefits which the growth and improvement of a rapid transit system bring to the city in which it is located. We do not need to emphasize or list these benefits, because electric railway financiers and managers know them full well. However, we do desire to emphasize that when an electric railway company conducts such a campaign of publicity as that now being carried on by the United Railways

& Electric Company of Baltimore, the results cannot be other than good. In the first place the well prepared information which is placed before the public in such a form that it is interesting to read brings about an interest between the patron and the railway. This offsets a large number of the petty criticisms so frequently promulgated. In the second place a newspaper depends for its sustenance on the revenues from its advertising columns. Therefore it is no more than right to expect that if the electric railway purchases space (and it need not be so very large an amount) the daily press will undertake to care for the best interests of that railway. Combining these two factors, an electric railway which has for its friends both the traveling public and the daily press can feel most secure as to receiving its just deserts.

ANNUAL REPORTS.

United Railways & Electric Company of Baltimore.

The principal results of operation of the United Railways & Electric Company of Baltimore during 1907 showed the following increases as compared with 1906: Gross earnings, 6.61 per cent; operating expenses, 7.74 per cent; net earnings, 5.5 per cent. Figures for two years follow:

	1907.	1906.	Increase.
Miles of track	396.2	394.5	1.7
Gross earnings	$7,018,081	$6,583,102	$434,979
Operating expenses	3,470,087	3,220,942	249,145
Net earnings	$3,547,994	$3,362,160	$185,834
Other income	6,505	4,725	1,780
Total net income	$3,554,499	$3,366,885	$187,614
Charges, taxes, etc.	2,487,942	2,365,587	122,355
Net divisible income	$1,066,557	$1,001,298	$ 65,259
Extraordinary expenditures	1,028,899	980,000	48,899
Surplus	$ 37,658	$ 21,298	$ 16,360
Operating expenses—per cent of gross earnings	49 44	48.93	0.51

The policy of appropriating for "extraordinary expenditures" practically all of the revenue not required for expenses, taxes and charges was continued; the amount so applied in 1907 was $1,028,899. The disbursements on this account are designated as "amounts required for rehabilitating the property other than ordinary maintenance and repair." The statement of the income account refers to the sum as "written off for extraordinary expenditures, subject, however, to final distribution by the board of directors," giving the inference that some other disposition may be made of the amount of these disbursements in the future. The "extraordinary expenditures" were equal to 14.7 per cent of gross revenue. The charges in operating expenses for maintenance were as follows: Maintenance of way, $205,886; maintenance of cars, $409,823; a total of $615,709. The former amount is equal to $520 per mile of track operated. The aggregate maintenance expenditures were 8.8 per cent of gross revenue. There was therefore expended on the property from revenue an amount equal to 23.5 per cent of gross earnings, or to 47.4 per cent of the entire sum charged to operating expenses. This represents actual outlay and does not include provision for a depreciation or renewals reserve.

William A. House, the president, states that the recession in business affected the revenues during November and December, but that the revenues in those months showed increases over the corresponding period of 1906. Eighty double-truck convertible cars were placed in service. The company sold 110 single-truck cars for $54,282. A coal car, an overhead line car and a single-truck derrick car have been built at the shops of the company. Four new car houses have been built and sites obtained for two additional houses.

Concerning the new transfer system (described in the Electric Railway Review of March 7, 1908, page 299) Mr. House states: "By this change the company was enabled to afford its patrons more liberal transfer privileges. It may be of interest to state that there is now an exchange of transfers between the lines of the system at 193 junctions with 1,614 direction privileges, thus enabling passengers to reach any section of the city for a single fare."

Statistics of traffic, with a comparison, follow:

	1907.	1906.	Increase.
Car-mile revenue, cents	26.06	25.30	0.76
Car-mile expenses, cents	12.87	12.37	0.5
Car-miles run	26,953,727	26,035,327	918,400
Revenue passengers	142,111,995	133,785,601	8,329,394
Transfers	55,165,581	53,413,492	1,752,089

The outstanding funded debt on December 31, 1907, was $54,185,000, an increase of $565,000 during the year. The common stock was unchanged at $15,000,000, but there was a reduction of $5,000 in the preferred stock, the amount outstanding being $55,000. Mr. House speaks of the policy of the company to comply with all reasonable requests for improved service or give good reasons for non-compliance where suggestions are impracticable, and adds: "The company considers that it is entitled to the earnest and cordial support of every fair-minded citizen, and that the two interests—carrier and patron—are interdependent and should co-operate to secure the best results."

MODIFICATION OF PLAN OF DIVISION OF COMPANIES IN INTERSTATE ACCOUNTING SCHEME.

The plan of division between large and small electric railway companies, as set forth in Accounting Series Circular No. 20 of the interstate commerce commission, will be modified materially. It can be stated upon authority that the amended classifications will provide for separating companies into either three or four classes.

The basis of division will be the gross annual revenue, as in the circular containing the tentative classifications promulgated under date of January 10, 1908, but the separation will recognize the difference between the accounting requirements of large and small railways, respectively, more satisfactorily than the tentative scheme of Circular No. 20. A representative of the Electric Railway Review has been permitted to see in Washington this week the tentative plan which is at present under consideration, and, while no final decision has been reached concerning some features of the system, or will be reached for some time, it has been settled that a revision of the scheme of application as between the large and small companies will be made.

While some of the most important companies in the country have not yet submitted criticisms of the proposed system of accounting to the interstate commerce commission, enough information has been received by special investigation through representatives who have visited different parts of the country and by correspondence, to indicate the fairness and desirability of change in the proposed application of an amplified classification of operating expenses to companies with small gross revenue.

Cannot Haul Cars Free for Railways.

The Washington supreme court rendered a decision on April 10 holding that it is in violation of the interstate commerce law for one railway to agree to haul cars of another railway for nothing. The Union Pacific and Oregon Railroad & Navigation Company, having a traffic agreement with the Coeur d'Alene & Spokane, an electric line, agreed to transport 20 cars for it from the St. Louis Car Company to the tracks of the electric line free of charge. After the cars were en route the electric line entered into a traffic agreement with the Great Northern. The Harriman lines delivered the cars and sent a bill for $90 per car freight. The electric line refusing to pay the bill, the Harriman roads sued the company for the amount

REPAIR SHOP RECORDS AT BALTIMORE.

Through the courtesy of H. H. Adams, superintendent of shops United Railways & Electric Company, Baltimore, we are pleased to present the following account of some interesting practices which this company pursues at its shops.

Supplies.

The general supply storage house for the entire railway system is located adjacent to the repair shops and therefore

Baltimore Shop Records—Preliminary Requisition.

it is not necessary to maintain a shop storeroom. When the head of any shop department desires to draw supplies he telephones an order clerk whose duty it is to transact the business between the shops and the supply department of the road. An installation of intercommunicating telephones throughout the various bays of the shops renders it unnecessary for any foreman to waste time in walking to the supply order clerk's desk.

As the request is received by the order clerk he makes out a memorandum requisition on the storekeeper. By means of a triplicate machine two copies on yellow stock and one copy on white are made. The original, which is on yellow paper, 4½ by 5¼ inches in size, is sent to the storekeeper by a

SUPERINTENDENT OF SHOPS

Baltimore Shop Records—Confirming Requisition.

messenger whose only duty is to deliver supplies to the various shop departments. The second copy of the preliminary requisition is also sent to the storekeeper and returned with the supplies as the order is filled. The shop order clerk receives this second copy and files it so that at the close of the day he can make out a confirming requisition covering all the supplies that have been received during the day. A third copy (on white paper) of the preliminary requisition is kept by the stock clerk so that he may have a check on the storekeeping department and thus make sure that all requisitions are filled.

One of the confirming requisitions is reproduced herewith. It will be noted that this blank form is headed "Electric Motor Repairs." There are similar forms for car repairs and paint shop work. Such confirming requisitions are made in duplicate and sent to the storeroom to be priced, extended and forwarded to the auditor. On these requisitions the shop order clerk combines each day all small orders for similar materials, thus reducing the number of items and the clerical work necessary after the requisition has left his hands. These confirming requisitions are 7 by 4 inches in size and are printed on stock of various tints to facilitate classification.

When any materials for which the shops have made requistion cannot be supplied from the storeroom, the superintendent of shops is advised of the situation on a special blank arranged as follows:

The United Railways & Electric Company of Baltimore.

Department.............. Date..............

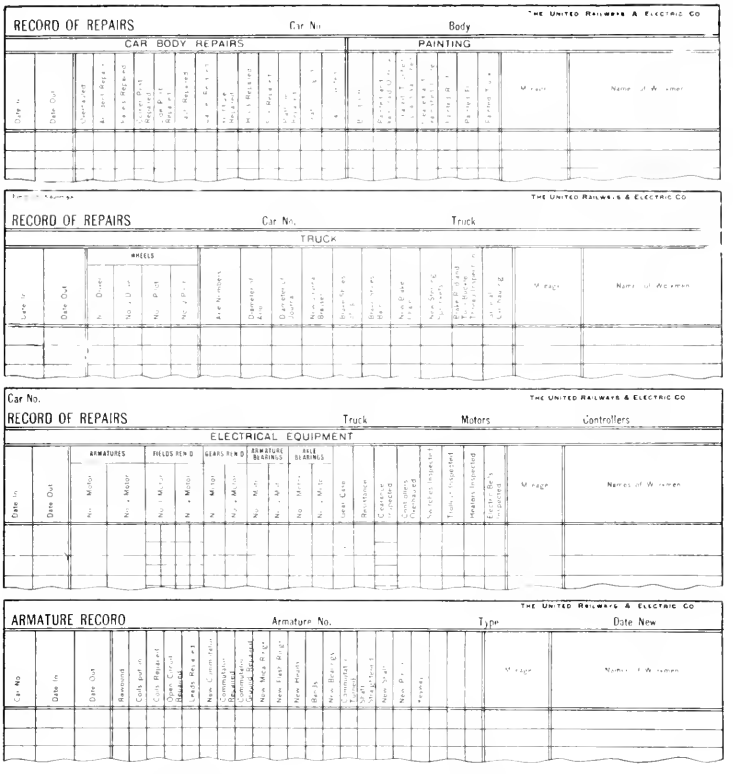
Supplies for the various car houses are ordered on the fifth, fifteenth and thirtieth of the month by each car house foreman. The lists are forwarded to the general foreman of repairs, who checks them and passes them to the superintendent of shops, so that they may be vised by him before they are handed to the storekeeper.

To assist the order clerk at the shops in keeping check on the number of armature troubles and extraordinary requests for materials, an armature report, 8½ by 11 inches, as illustrated, is used. Each day the order clerk telephones the car houses and ascertains the car and armature numbers and the nature of the trouble affecting each damaged armature on the system. This information is recorded on the report illustrated herewith and once each month a summary is made, so that a comparative statement of the armature failures can be had for discussion of any new methods that it may be found desirable to put into practice.

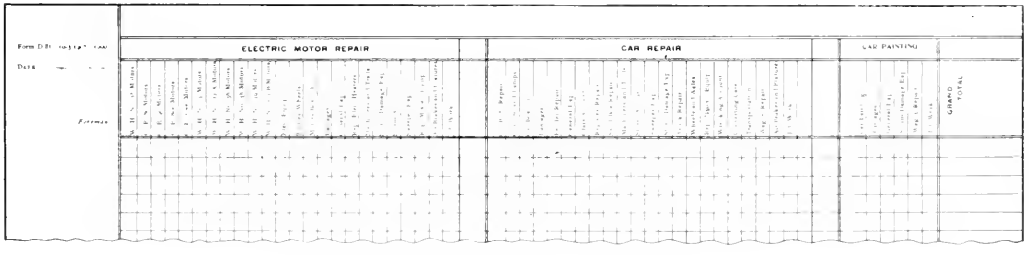


Baltimore Shop Records—Headings of Equipment Record Cards.

The system of card repair records recommended by the Accountants' and Engineering associations at the St. Louis convention is closely followed in the Baltimore shops. Cards 9¾ by 7 inches in size, ruled on both sides and with headings for recording body repairs, new electrical equipment, trucks and armatures, are vertically filed in special cabinets. The four headings used on these cards are reproduced herewith. It will be noted that these records require no writing except the marking down of the dates and car numbers, the records being made complete by inserting check marks under the proper column headings. This very complete repair recording system of the United Railways & Electric Company requires for its upkeep only part of the time of one man, who has in his filing case cards for 2,000 cars and for about 4,750 armatures.

The clerk who has charge of the record of repairs receives the data for entering on the cards from the various shop foremen. This information is compiled on blanks as illustrated herewith. Similar blanks are kept for the lists of parts repaired and used by the foreman in charge of the car body and painting work and the electrical equipment repairs. The latter blanks are reproduced herewith. The original size of this repair report, which bears the list of possible repairs to the electrical equipment and parts to the running gear, is 7½ by 11 inches in size. These blanks are supplied to the various foremen in pads of convenient thickness.

For collecting information regarding repairs made to armatures a blank 4 by 8½ inches in size and Dennison tags, 5¼ by 2⅝ inches, are used. When an armature is taken out for repairs one of the tags is tied to it and remains with it until the armature is returned to some motor case. One of these tags is reproduced herewith. When the repairs to any armature have been completed the foreman makes out an armature report, which exhibits the armature number, car number, date the armature was taken out, nature of all repairs made, names of the workmen making these repairs, date it was returned to a car and the number of that car. One such report is illustrated.



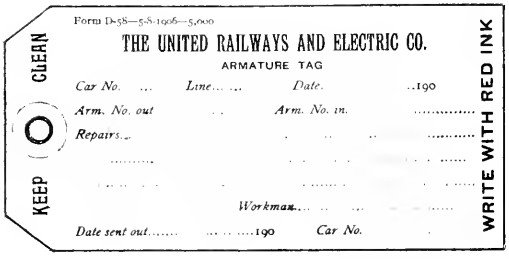
Baltimore Shop Records—Distribution Sheet for Labor.

A particularly ingenious and very satisfactory method is used for distributing and recording the time put in by the

Repair Reports.

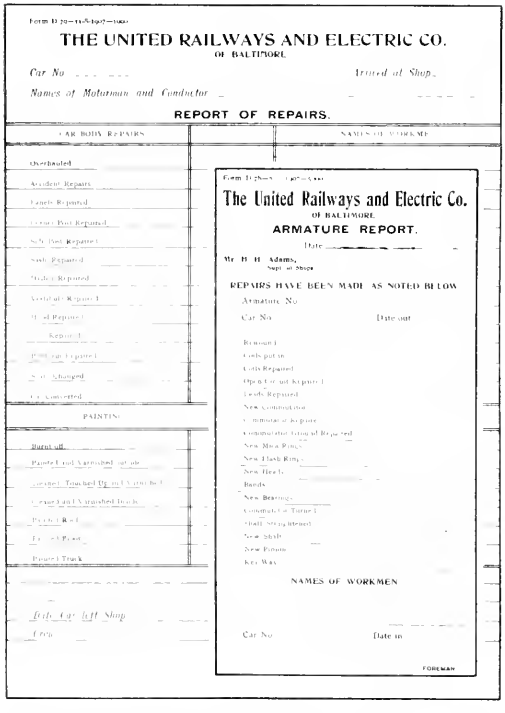
The system of card repair records recommended by the Accountants' and Engineering associations at the St. Louis

various workmen on the different classes of shop work. The basis for this time distribution is a sheet 17 inches wide by 20 inches high, with headings as illustrated. Each day one of these sheets is mounted in a wooden frame, as shown in the accompanying halftone engraving. It will be noted that the frame is so designed that it exhibits to the foreman only those columns which it is his duty to fill in as the day's work progresses. On the left-hand side of the frame is mounted



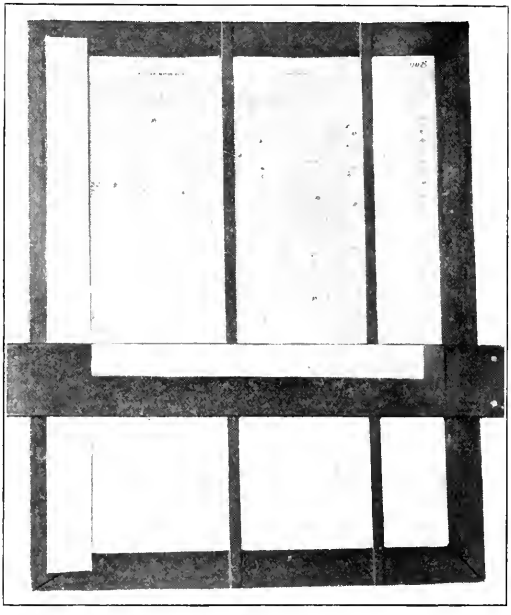
Baltimore Shop Records—Shop Tag for Armature.

each day a list of the shop men at work. The names of the various men are grouped according to the shop departments in which they are working. Across the frame and mounted



Baltimore Shop Records—Repair Reports for Armatures and for Bodies.

so that it will slide up and down is an arm rest on which is pasted a duplicate set of column rulings as exhibited by the large sheet contained in the frame. This movable column index insures accuracy and saves times when the foreman is distributing the time opposite the names up and down the large sheet. By the aid of this movable rest he has the column headings directly adjacent to the space opposite the employe's name whose time he may be recording for any of the various classes of repair work. The list of names affixed to the left-hand side of the frame holding the distribution sheet is dated with a dating stamp; and after the sheet has been filled in for one day this list is taken off the frame and fastened to it so that at any future time it is a simple matter to ascertain the names of all men working on any class of



Baltimore Shop Records—Frame for Holding Labor Distribution Sheet.

repairs on any former date. The totals are extended to a column on the right-hand side of the sheet and these are checked against the records of the shop time clock.

Chicago Convention National Electric Light Association.

The annual convention of the National Electric Light Association will be held at the Auditorium hotel, Chicago, Tuesday, May 19, to Friday, May 22. The programme, which has been tentatively announced, includes the following papers:

"Power-Load Development for Central Stations of Moderate Size," "Some Unappreciated Possibilities," J. R. Bibbins and Charles Robbins; "The Small Station and Its Economical Operation," J. T. Whittlesey and Paul Spencer; "Low-Pressure Steam Turbines," J. W. Kirkland; report of committee on gas engines, W. C. L. Eglin, chairman; "Receiving Stations Operated from High-Tension Lines," S. Q. Hayes; report of insurance expert, W. H. Blood, Jr.; report of committee on protection from lightning and other static disturbances, Robert S. Stewart; "The Value of Care and Maintenance of Meters," H. D. King; "Some Experiments in Combustion," S. J. Lenher; "Specifications for Construction on Joint Poles," Paul Spencer.

In connection with the convention an interesting exhibition of electric lighting appliances and several entertainments have been arranged.

The interstate commerce commission on April 24 sent to the senate a report regarding the ownership of coal lands by railways. This report covers investigations in Colorado, Utah, Oklahoma and Wyoming.

UNIFORM REPLY BY INDIANA AND OHIO LINES TO INTERSTATE ACCOUNTING CIRCULAR.

A number of electric railways in Indiana and Ohio have joined in a uniform reply to Accounting Series Circular No. 20, issued by the interstate commerce commission. In addition to the uniform answer, however, the individual roads will, if they desire, make further criticisms concerning the application of the tentative classifications to their operations. The following roads have presented the uniform response:

Chicago South Bend & Northern Indiana Railway.
Evansville & Southern Indiana Traction Company.
Ft. Wayne & Springfield Railway.
Ft. Wayne & Wabash Valley Traction Company.
Indiana Union Traction Company.
Indianapolis & Cincinnati Traction Company.
Indianapolis Columbus & Southern Railway.
Indianapolis Traction & Terminal Company.
Kokomo Marion & Western Traction Company.
Ohio Electric Railway.
Terre Haute Indianapolis & Eastern Traction Company
Toledo & Chicago Interurban Railway.
Winona Interurban Railway.
Lebanon & Franklin Traction Company.
Toledo Urban & Interurban Railway.
Indianapolis & Louisville Traction Company.
Marion Bluffton & Eastern Traction Company.
Detroit United Railway.
Mahoning & Shenango Railway & Light Company.
Lake Shore Electric Railway.
Lorain Street Railroad.
Tiffin Fostoria & Eastern Electric Railway.
Western Ohio Railway.
Cleveland & Southwestern Traction Company.
Scioto Valley Traction Company.
Toledo & Chicago Interurban Railway.

The letter of criticism was prepared by a committee, as follows: William H. Forse, Jr., chairman, treasurer Indiana Union Traction Company; M. W. Glover, auditor Ohio Electric Railway; Joseph A. McGowan, treasurer Terre Haute Indianapolis & Eastern Traction Company. An abstract of the letter follows:

The five general accounts (of operating expenses), with the exception of "III—traffic expenses," are practically the same as have been used by the electric railways of the country for the past 15 or 20 years, and no criticisms can be made of these. It is in the subdivision of these five general accounts into 116 primary accounts, which are proposed for the larger electric railway lines as stated in the tentative classification found on pages 11, 12 and 13 of Circular No. 20, that we desire to respectfully submit our most serious and earnest objections.

While the tentative classification submitted for small railways names but 22 primary accounts, the circular states that the small lines are to follow the text descriptive of the primary accounts provided for the larger lines. The small line would therefore find little relief in the use of a restricted number of accounts, from the fact that the same departmental separation of charges and other objectionable features shown so clearly in the titles of the 116 accounts would be contained in the text of the 22 accounts.

In the first place, we doubt the wisdom or practicability of prescribing the same method of accounting for steam railways, electric railways, express companies, sleeping car companies, carriers by water and pipe lines. Outside the fact that all are transportation agencies, they differ in nearly every other respect. There can certainly be nothing in common between the fundamental accounts, for example, of electric railways and pipe lines or steamboat companies, and a general system of classification of accounts which attempts to include all of these classes of companies must necessarily be unsuitable and most unsatisfactory to all.

Those who are most directly concerned in securing accurate and comprehensive details of receipts and operating expenses have, for many years past, employed the best accountants procurable, whose experience embraces years of practical accounting, both with steam and electric railways, to so classify the operating expenses of electric railways as to clearly show all the necessary and important divisions of expenditures, and thus enable the owners, operators and investors—who certainly are most vitally interested—to gain a minute and comprehensive knowledge of their properties and at the same time be in a position to supply such information to the public or federal and state authorities.

For over 10 years past the electric railways of this country have been working with 38 accounts, which in the main have served all purposes and have stood the test of time and actual needs. This classification has been adopted by a number of states as the standard form of accounts to be used by electric railways. To provide, however, for some new features of operation, such as the traffic department and the operation of interurban lines, the electric railways have used some additional accounts. These accounts are all embraced in the tentative classification of operating expenses which was prepared by the American Street and Interurban Railway Accountants' Association at the solicitation of the interstate commerce commission and adopted by the association at its convention held at Atlantic City, N. J., on October 15, 16 and 17, 1907. This classification comprises 50 accounts, which in our opinion ought to be the maximum number.

In all systems of scientific accounting there is recognized a final point of utility beyond which fine calculations, subtle distinctions and immaterial divisions are regarded as of no practical benefit, and as mere mathematical gymnastics. Such minutiæ might be considered indifferently were it not that their compilation involves much extra time, labor and expense.

Applying this principle to many of the proposed accounts in Circular No. 20, we feel certain that our present force of clerks is wholly inadequate and would have to be greatly augmented in order to fulfill the requirements. To impose such a burden upon the electric railways would work a great hardship to which we feel they should not be subjected, unless the present system were inadequate or additional information could be secured thereby, which is not true in the present case; and if the proposed classification as given in Circular No. 20 were adopted, many of the accounts would represent at best a compilation of guesses.

To enumerate some of the many objectionable features in the classification printed in Circular No. 20, we might cite the joint facilities accounts, the separation of the cost of electric current used for various purposes; maintenance of electrical equipment of cars; the many subdivisions of damage to property, and injury to persons; the subdivision of insurance, printing and stationery, clearing accounts, etc. As a specific example of how one of the accounts proposed would work out in practice, which would also be true of a great many of the accounts proposed in Accounting Series Circular No. 20, the salary of a man whose authority would extend over maintenance of way, maintenance of equipment, power plant and car operation, such as division superintendent or division manager, in many instances would not exceed $75 per month. Under the proposed classification, the salary of this man would be divided between accounts Nos. 14, 15, 24, 32, 63 and possibly 70 and 88, and perhaps some other accounts. The division of this would be merely guesswork, which is entirely unsatisfactory for statistical purposes. If a man were supposed to actually keep a record of how much time was to be charged each account, it would be necessary to furnish a timekeeper to go along with him and keep the record.

The objections referred to in this letter are more fully set out in the following:

Damages.

Accounts Nos. 15, "other maintenance of way expenses"; 24, "miscellaneous electric line expenses"; 32, "miscellaneous buildings and structures expenses"; 42, "injuries to persons (availability maintenance)"; 63, "other equipment expenditures"; 101, "loss and damage (to merchandise in transit)"; 102, "damages to property (transportation)"; 103, "injuries to persons (transportation)."

There is no objection to having one account for loss and damage to freight and other merchandise intrusted for transportation (account No. 101) and another account for injuries to persons and property. We do not think it practicable, however, to attempt a separation of damage to property and injuries to persons. For example, if a vehicle and driver were struck by a car, an arbitrary settlement might be made or one verdict be rendered covering the total amount to be paid for injuries to the driver and damages to the property. It would be impossible to state with accuracy the proportions of the total payment allotted for injuries to the person and damage to property, respectively.

Neither is it always possible to determine how the payments of claims should be classified. Two cases which occurred in Indiana will illustrate the point. A section man while engaged in track maintenance stood too close to a passing passenger car and was struck and injured. A section man while on a hand car was overtaken by a passenger car, a collision occurred and the section man and the motorman were injured.

The expense in connection with the settlement of all damage claims should be included in one account. Even if it were possible to class the actual payment of every claim, the expense bears no proper relation to the amount of the claim. It sometimes costs less to settle a very large claim than one

which is small and of doubtful legality. If an attempt were made to calculate the expense of every separate case, the result would be valueless and it could not possibly be accurate.

Stationery and Printing.

Accounts Nos. 15, "other maintenance of way expenses"; 24, "miscellaneous electric line expenses"; 32, "miscellaneous buildings and structures expenses"; 63, "other equipment expenditures"; 72, "traffic supplies and expenses"; 91, "stationery and printing (transportation)"; 113, "stationery and printing (general)."

A large percentage of the expense for printing and stationery is incurred in connection with car service, for tickets, transfers and station supplies, and the balance can rightly be put under general expenses. We therefore recommend two accounts, as follows: "Printing and stationery—transportation" and "printing and stationery—general."

To attempt to subdivide the expense for printing and stationery outside transportation, other than placing it in general expenses, would be wholly guesswork and of no practical good whatever.

Insurance.

Accounts Nos. 15, "other maintenance of way expenses"; 24, "miscellaneous electric line expenses"; 32, "miscellaneous buildings and structures expenses"; 63, "other equipment expenditures"; 100, "insurance (transportation)"; 110, "insurance (general)."

This is another item of expense that should not be departmentalized. Insurance is one of the general expenses of administration and as such should be contained in one primary account under general expenses. It is most essential, in the monthly reports to owners and operators of electric railways, that insurance be shown as one amount instead of being lost under the title of "miscellaneous."

Maintenance of Electric Lines.

Transmission lines—account No. 17, "high-tension transmission lines." Distribution system—accounts Nos. 18, "overhead feeders"; 19, "underground feeders"; 20, "track bonding." Conductors—accounts Nos. 21, "overhead trolley lines"; 22, "third-rail conductors"; 23, underground conductor rails"; 24, "miscellaneous electric line expenses."

A separation of line maintenance expenses, if carried too far, would impair the value of the resulting statistics and we therefore recommend that but four primary accounts be used instead of the eight that are named. The accounts recommended, which would suffice for the largest lines, are as follows: "High-tension transmission," "low-tension transmission," "track bonding" and "miscellaneous electric line expenses."

Maintenance of Equipment.

Maintenance of service equipment—(maintenance of way and structures). Accounts Nos. 34, "snow equipment"; 35, "work cars"; 36, "electric locomotives (utility)"; 37, "miscellaneous service equipment." Maintenance of revenue equipment—(maintenance of equipment). Accounts Nos. 47, "passenger cars—repairs"; 48, "combination cars—repairs"; 49, "express cars—repairs"; 50, "mail cars—repairs"; 51, freight cars—repairs"; 52, "locomotives—repairs."

It is quite important to consider as one item of operation the cost of maintaining all classes of equipment. The accounts covering maintenance of service equipment should by all means be grouped under maintenance of equipment rather than maintenance of way and structures.

Work equipment is frequently converted into snow equipment by attaching a now plow, and there is no need of separating these classes of (work and snow) equipment.

The classification provides separate accounts for the maintenance of passenger, combination, freight, mail and express cars. It is not stated, however, for electric railways, what distinction shall be made between express and freight cars, these terms being used synonymously in actual operation. A combination car is described as a passenger and baggage car. Some electric railways carry baggage in separate compartments, while others carry it in the smoker or other passenger compartment. The various classes of equipment should be divided into not more than three accounts, under the general account maintenance of equipment, viz.:

"Maintenance of passenger and combination cars"; "maintenance of freight, express and mail cars" and "maintenance of service equipment."

Maintenance of Electric Equipment of Revenue Equipment.

Accounts Nos. 53, "electric equipment of passenger cars—repairs"; 54, "electric equipment of combination cars—repairs"; 55, "electric equipment of express cars—repairs"; 56, "electric equipment of mail cars—repairs"; 57, "electric equipment of freight cars—repairs" ; 58, "electric equipment of locomotives—repairs."

Five accounts are provided for the maintenance of electric equipment of revenue cars (in addition to electric equipment of locomotives).

It has been found impracticable, in past years, to separate the cost of maintaining the electric equipment of the various types of cars, owing to the fact that the same motors are used alternately under different bodies. Electric railways do not usually have enough motors to equip all of the car bodies. Motors that are used under closed bodies and snow equipment in winter are quite frequently used under work and open passenger cars in summer and under freight cars when traffic demands it. These changes are made with considerable frequency and the identity of the individual motor is entirely lost. Accurate statistics would not be secured if this separation were made, and it is recommended that but one account be used, entitled "maintenance of electric equipment of cars."

Availability Maintenance Expenses.

(Group "E"—maintenance of way and structures). Accounts Nos. 39, "care of track"; 40, "removal of snow, sand and ice"; 41, "cleaning, sprinkling and oiling roadbed"; 42, "injuries to persons"; 43, "other miscellaneous maintenance expenses."

A new group of accounts that has not been applied to the steam railways is group "E"—availability maintenance expenses. It is probable that one idea which the commission had in mind in submitting this group of accounts, is to separate the amount expended for maintaining, and the amount expended for making the track available for operation. It would be quite a hardship to try to keep such expenses separately. The text contains many fine shadings. For example, if a section man inspects the track and tightens a bolt, which needs it, the cost of inspecting is to be charged to account No. 39, and of tightening bolts to account No. 8. In steam railway classification these are both contained in one primary account, namely, "roadway and track." Items that are so similar and so closely related should be included, for the purpose of securing accuracy, in one account. No good could possibly result in making a theoretical separation which cannot naturally be made, and we recommend that these accounts be merged into the other accounts grouped under "maintenance of way and structures," and elsewhere.

Joint Facilities.

Accounts Nos. 45, "maintaining joint tracks, yards and other facilities—Dr."; 46, "maintaining joint tracks, yards and other facilities—Cr."; 66, "maintaining joint equipment—Dr."; 67, "maintaining joint equipment—Cr."; 104, "operating joint tracks, yards and other facilities—Dr."; 105; "operating joint tracks, yards and other facilities—Cr."; 115, "general administration joint tracks, yards and other facilities—Dr."; 116, "general administration joint tracks, yards and other facilities—Cr."

The principle involved in the use of these accounts would cause much inaccuracy because of the conditions that are prevalent in actual operation. For example, we will say that a terminal owning carrier charges each of the companies using its terminal tracks and station a rental of two cents per passenger carried. The cost of maintaining the joint facilities will vary somewhat with the volume of traffic, but not entirely so, for if a few more or less passengers are carried, the greater or less amount of wear and tear (or power required) will hardly be noticeable. It will therefore be necessary to estimate the amount of additional expense incurred by reason of the use of terminal facilities by other carriers and these estimates will result in anything but scientific accounting. If the terminal owning carrier is not under the jurisdiction of the interstate commerce commission (or a state commission using this system of accounting) the interstate carriers using its tracks cannot compel the terminal owning carrier to give access to its books or aid in making estimates of the cost of maintaining, operating and administering the joint facilities in order to determine the amount that shall be charged in the lessee's operating expenses. These items will then be the result of guesses and thus be even less accurate than estimates.

As an example of the insurmountable obstacles that would be met in compiling this class of statistics, we will cite the conditions as they actually exist in the city of Indianapolis, Ind.

There are 12 interurban electric railway lines entering the city of Indianapolis, all over the tracks of the Indianapolis Traction & Terminal Company—a local street railway. The cars of these various interurban lines come from all directions, but use only certain streets or portions of streets of the local company. In some instances the cars of two or more companies run over the same street, although the cars of the dif-

ferent companies differ both as between companies and cars of the same company, in weight, types of motor, etc. and consume more or less power and cause a greater or less expense for cost of maintenance of track, electric line, etc. The city cars of the local company, which also differ as between themselves in the respects named, make use of the same tracks. At certain approaches to the terminal station in Indianapolis the cars may enter the station on different tracks from day to day. Each interurban line pays to the Traction & Terminal Company three cents per passenger for use of its tracks and one cent per passenger for use of terminal station. The question is, on what basis are the fixed charges and the different maintenance charges to be computed? No accurate figures could be obtained by taking the number of passengers hauled, as they vary continually, and, as the size and type of car differ, it could only be a mere guess to take the track-miles or car-miles as a basis. The giving of this information, even if estimated, by the Indianapolis Traction & Terminal Company to the interurban lines would be purely optional on its part and the interurban lines would have to accept its figures, if so given.

Power Transferred.

An account new to railway operation is No. 80, "power transferred." This provides that the cost of electric current or steam when used for other purposes than the propulsion, lighting and heating of cars operated for revenue shall be charged to the accounts benefited by the service and credited to this account. Thus, if stations are lighted by electric current, shops heated with steam, work and line cars lighted by electric current, or machinery driven by power house steam, this power must all be measured and the cost determined. Even if it were practicable to have meters to measure this current there would be wide variations in methods used in compiling statistics, caused by the fact that transmission losses and the drop of voltage vary to such an extent as to require a great deal of estimating.

Suppose, as is frequently the case, that lathes, planers, drills and other shop machines are belted to a line shaft which is rotated by a steam engine driven with power house steam. At various times during the day different machines are turning axles and wheels, finishing trolley wheels and bushings, and doing general repair work on track and line material and power house equipment. This is but one example of many that might be used to show the fallacy of using such an account as "power transferred." Statistics that were a compilation of guesses would be valueless, and these costs could not be secured except by using some theoretical bases from which to make guesses by the "rule of thumb."

Cost of Electric Current Used for Lighting.

The "cost of electric current used for lighting passenger and other cars" is provided for in account No. 95. Most of the text of this account, like others, is copied from the steam road classification which provides that the cost of lighting cars shall be included in account "car supplies and expenses." In the operation of street railway and interurban lines the usual method followed is to have one central power station from which power is transmitted over considerable distance—in many cases from 100 to 150 miles. This current is usually transformed, at substations located several miles apart, into direct current and is used primarily for supplying power to the motors for propelling the cars; but it is also used for furnishing current for the lighting of cars and likewise for operating the motor of the air compressor for furnishing air to the air brakes. The current is also used, in many instances, for heating the cars. It would be wholly impracticable to attempt to separate the power for lighting, for the propulsion of the cars, for operation of the air brakes, and for heating. To make such a division it would be necessary to have meters in the cars to measure the current consumed for lighting, heating, air brakes and the propelling motors. At the present time meters have not been so perfected as to stand in actual daily practice the jolts and jars which would be incident to the operation of the cars and the readings would thus be absolutely unreliable.

Cost of Electric Current Used for Power.

Accounts Nos. 8, "roadway and track"; 10, "bridges, trestles and culverts"; 14, "telegraph and telephone lines"; 40, "removal of snow, sand and ice"; 92, "clearing wrecks."

Accounts Nos. 8, 10, 14, 40 and 92 provide that the cost of power consumed by cars in maintaining track, roadway, trestles, culverts, telephone and telegraph lines, in the removal of snow and ice and clearing wrecks, shall be prorated among the various accounts. This is no doubt suggested by the fact that the steam road text for these accounts is copied almost verbatim, and the addition, "cost of power," inserted in each. Including such accounts in an electric railway classification is probably due to the fact that the fuel used in operating steam locomotives for the various kinds of work is thus prorated. Conditions, however, on electric railways are entirely different, as recited in our objections under (cost of electric current used for lighting) account No. 95. It is evident that very slight consideration has been given to actual electric railway operation, for no mention is made in this way of current consumed by cars used in line maintenance, sprinkling and oiling.

Clearing Accounts.

These accounts illustrate quite forcibly the extent to which statistical tabulations may be carried, the very slight advantage to be gained by their use, and the vast amount of additional work required by any theoretical plan of accounting which departmentalizes and separates into minute portions the statements of results expressed in figures. A concrete example will illustrate. The joint expenses of purchasing and of operating storerooms on an electric line will ordinarily not exceed one-half of 1 per cent of the operating expenses. If clearing accounts were used this one-half of 1 per cent would be carried into the account "store expenses." At the end of each month or year the accountant must apportion to each account charged with material issued a percentage of the one-half of 1 per cent that is just and equitable in view of the services rendered by the storekeeper and his staff. But this is not all. The percentage of this one-half of 1 per cent that is represented by the purchasing agent's salary and expenses must be separated from the other portion of the expense, and each account that has received the benefit of the purchasing department's services must be allotted its portion of the expenses, with due regard, however, to the material that was not purchased by the purchasing department, but ordered in an emergency by some other department.

Such a system of accounting would involve a great amount of estimating and would ve very expensive in its operation. The clearing accounts should all be eliminated, in our estimation.

Outside Operations.

Accounts Nos. 44, "other than railway operations—Cr." (maintenance way and structures); 65, "other than railway operations—Cr." (maintenance equipment); 81, "other than railway operations—Cr." (transportation).

This classification introduces a set of accounts new to railway operation, namely, credits for "outside operations." We are not provided with a classification of electric railway revenue and cannot predict what will be considered an "outside operation" for electric railways by the commission. The principle of the outside operations accounts is, that operating expenses shall be credited with the exact cost of products sold and the difference between that cost and the amount received shall be credited to income account. This system of accounting has not heretofore been closely followed by railways, probably for the very good reason that it is so impracticable in operation, although theoretically a good arrangement. The scheme provides, for example, that if power is used for lighting a park, the outside operation (park) is to be charged with the cost of the current used. It is not stated whether cost is to include a portion of the expenses of railway administration as well as power plant expenses, but in a general way it is stated that the cost is "cost of production." This item will be quite important to those companies conducting a general lighting business, especially if it is decided that the sale of power for various purposes is to be considered an outside operation.

It is generally understood that it is impracticable to attempt a separation of some features of railway operation, between the part used in transportation and the part used for other purposes. Thus, in steam railway practice, it has not been found practicable to endeavor to separate the expenses of the electric telegraph used by the carrier for transmitting its own messages from the expenses of the same lines used in transmitting commercial messages for the public (see steam classification of operating revenue, first issue, page 15).

This principle applies with particular force to electric current as used in railway operation—when the difficulty of measuring and of accounting for the leaks and losses of current is considered it will readily be conceded that the separation cannot be made without guessing and estimating.

Express Service.

Account No. 98. This account includes the wages of motormen and messengers in express service. This seems to be a duplication, as accounts Nos. 85 and 87 include wages of motormen and other trainmen in express service. Another item that should not be included in this account is wages of warehouse men. In the majority of cases when express is handled by an electric railway, the stations where express matter is handled are the same as used for freight and passenger business, and it would hardly be possible to show sep-

arately the pay of "warehouse men," any more than other items of expense incurred in connection with the station as a whole.

Tentative Classification of Expenditures for Road and Equipment.

The general criticism of the classification of operating expenses applies with equal force to the tentative classification of expenditures for road and equipment, namely, the superabundance of accounts and the too minute separation of charges.

Account No. 61 is followed by a note stating that "discounts on securities issued for construction purposes or to raise funds for construction should not be charged to this account or considered as a proper charge against construction." This is such a departure from the practice of past years that it deserves special consideration. It has heretofore been considered that discount on securities issued for construction purposes or to raise funds for construction is a part of the cost of financing and constructing the property. Discount is somewhat analogous to the interest accruing on the securities during the construction period, this being an item of construction cost.

The classification of construction and equipment accounts adopted by the Street Railway Accountants' Association of America has been found practicable in operation and its further use is recommended. It is composed of 15 accounts.

NEW YORK PUBLIC SERVICE COMMISSION TENTATIVE ACCOUNTS FOR ELECTRICAL AND GAS CORPORATIONS.

The New York public service commission, second district, has promulgated a tentative scheme of accounts for electric lighting, heating or power and gas corporations. The classifications were prepared by W. J. Meyers, statistician of the commission, and criticisms by companies within the jurisdiction of the commission are invited. The circular grades corporations into four classes, as follows: With annual gross revenue of below $10,000; with $10,000 or less than $100,000; $100,000 or less than $1,000,000; and $1,000,000 or over. The gross revenue is the basis for determining the classifications to be used. An abstract of some of the important features of the system follows:

To the capital account "Franchises (Electric)" is to be charged, as provided by the public service commissions law, "the amount (exclusive of any tax or annual charge) actually paid to the state or to a political subdivision thereof as the consideration for the grant of such franchise or right" as is necessary to the conduct of the corporation's electric operations.

Suspense Accounts.

When any expenditure is made the appropriate disposition of which is not yet determinable, or when any loss occurs which under the rules of the public service commission may be spread over a period of time, or when any debit made for any other reason may be amortized, such expenditure, loss or other debit shall, except as otherwise directed, be charged to an appropriate account in this group of accounts.

The seven accounts provided in this group are entitled:

"Unamortized Discount on Debt."—When funded debt securities and other evidences of indebtedness are disposed of for a consideration whose cash value is less than the par value of the securities or other evidence of indebtedness and the interest thereon accrued at the time the transfer takes place, the excess of such par value and accrued interest over the cash value of the consideration received shall be charged to this account. At or before the close of each fiscal period thereafter a proportion of such discount based upon the life of the security to maturity shall be credited to this account and charged to the account "amortization of discount on debt" in "income" account.

"Unamortized Discount on Stocks Outstanding."—If any stock was disposed of prior to July 1, 1907, for a consideration whose cash value was less than the par value of such stock, the excess of the par value of the stock over the cash value of such consideration shall be charged to this account. The conditions under which and the rate at which discount on stocks issued shall be amortized, if at all, are solely within the discretion of the corporation. Such amortization shall be effected, if at all, through the proper "appropriation" account.

"Supersession Suspense."—When any tangible capital is taken out of service because superseded by new capital more abreast of the progress of the art or better adapted to the circumstances and conditions of the enterprise, there shall be charged to this account the original cash cost of such superseded capital (estimated, if not known, and where estimated the facts upon which such estimate is based shall be shown in the entry) less the sum of: (i) Obsolescence and unrepaired wear and tear accrued prior to ..... [the date on which this accounting order will become effective] on such capital so superseded; (ii) amounts charged in respect of such capital to the account "amortization of tangible capital—estimate" (an operating expense account) since ..... [the said date]; and (iii) the proceeds of sale (if any) or the salvage or scrap value at time of retirement of such capital so superseded. To this account shall be credited in the month in which any charge is made as above directed and each month thereafter until the whole charge is amortized or wiped out not less than ... per cent of such charge, and the amounts credited to this account shall be concurrently charged to the account "supersession amortization" (an operating expense account).

"Extraordinary Casualties to Capital Suspense."—When any tangible capital is destroyed or irreparably damaged through any extraordinary casualty there shall be charged to this account the original cash cost of such capital (estimated, if not known, and where estimated the facts upon which such estimate is based shall be shown in the entry) less the sum of three matters similar to those provided in "supersession expense."

"Other Extraordinary Casualties Suspense."—When any extraordinary casualty occurs causing loss other than of capital, the total amount of such loss other than capital, estimated if not known, shall immediately be charged to this account, and the same amount credited to an account called "reserve for other extraordinary casualties."

"Extraordinary Governmental Requirements Suspense."—When any extraordinary governmental requirement is made upon the corporation, the total expense caused thereby shall be charged to this account, and in the month when any such charge is made, and in each month thereafter until such charge is completely amortized or wiped out, there shall be credited to this account not less than ... per cent of such charge, and the amounts credited to this account shall be concurrently charged to the account "extraordinary governmental requirements amortization" (an operating expense account).

"Other Suspense."—To this account shall be made all debits not elsewhere provided for and the proper final disposition of which is uncertain.

"Questionable Debts."—When any debt owing to the corporation is so far overdue as to need special effort for collection, it shall be credited to the account in which theretofore charged, and charged to the account "questionable debts," and there held during the period of special attention. This account does not include so-called "uncollectible bills," for which see the account "uncollectible bills" among revenue accounts.

"Bad Debts."—When any questionable debt becomes in the opinion of the corporation practically worthless it shall be credited to the account "questionable debts," and charged at a nominal amount to the account "bad debts," the difference between the par value of the debt and such nominal amount being charged to the account "bad debts written off," which account shall be closed at the end of each fiscal period into the "surplus or deficit" account.

Reserves shall be classified as permanent and temporary. By permanent reserves are meant those that must be maintained intact during the life of the corporation. Permanent reserves shall be classified into the two classes, premiums on stocks outstanding and other permanent reserves. Premiums on stocks outstanding shall be subclassified with respect to the several classes of stocks. When a premium is realized upon an issue of any particular class of stock, such premium shall be credited to the subaccount above provided for such class of stock, and such credit shall remain in such account so long as such stock remains outstanding.

To the account "other permanent reserves" shall be credited all reserves not above provided for created to remain intact until the dissolution of the corporation. A separate subaccount shall be created for each particular purpose for which a reserve is raised, and the purpose of the reserve shall be designated in the title of the account thereof and shall be expressed in full in the first entry in such account.

By temporary reserves are meant those that are not intended to remain intact during the life of the corporation. Temporary reserves shall be classified as contractual reserves and non-contractual reserves.

A comparison of the balances in the foregoing accounts at any particular moment will, if the accounts have been properly kept, show the then existing condition of a corporation's affairs so far as such condition can be shown through the accounts.

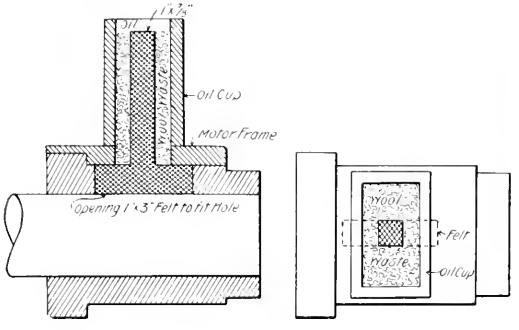
SOME USEFUL SHOP SCHEMES.

BY H. M. ASHENFELTER, SUPERINTENDENT OF MOTIVE POWER CHICAGO SOUTH BEND & NORTHERN INDIANA RAILWAY.

The Chicago South Bend & Northern Indiana Railway Company operates both interurban and city service on its various lines in northern Indiana. In the South Bend shops of this company are a number of kinks for facilitating repair work, oiling and inspection that may be of general interest.

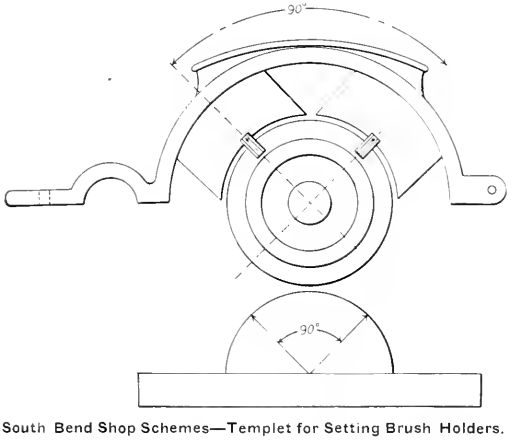
Armature Bearing Oiler.

Accompanying sketches show a constant feed oil cup designed with a view to keeping the armature bearings clean and well lubricated. Referring to the illustration it will be noted that the oiling device comprises a grease cup mounted on the top of the journal box casting and containing a block



South Bend Shop Schemes—Armature Bearing Oiler.

of felt for distributing the oil. This piece of felt has the shape of an inverted letter "T." The lower part of the felt is 1 inch square in section and 3 inches long, resting directly



South Bend Shop Schemes—Templet for Setting Brush Holders.

on the revolving shaft. This felt block closely fits a 1 by 3 inch hole cut through the bearing and its shell. The upper part of the felt oil distributor is 1 by $\frac{7}{8}$ inch in section, held in the center of the oil cup by a surrounding packing of waste. In the summer cotton waste is used for packing and in the winter wool waste is used, so that the oil may always flow freely.

Statements are presented herewith showing the cost of lubrication for the 57 cars operated in both city and interurban service during the months of May and June, 1907, and January, 1908. These statements include the total lubrication of motors, car journals and air compressor motors. Of the 57 equipments operated 25 are 4-motor cars with air brakes.

May, 1907.

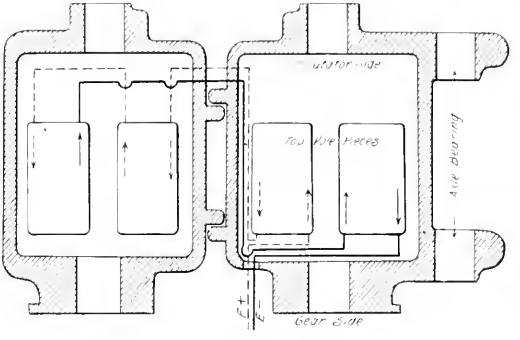
Mileage, 213,577; oil, 423 gallons; journal grease, 528 pounds.

Cost of car oil per 100 car-miles	$0.0116
Cost of journal grease per 100 car-miles	0.0111
Total cost of lubrication per 100 car-miles	$0.0527

June, 1907.

Mileage, 213,979; oil, 334 gallons; journal grease, 735 pounds.

Cost of car oil per 100 car-miles	$0.0327
Cost of journal grease per 100 car-miles	0.0154
Total cost of lubrication per 100 car-miles	$0.0481



South Bend Shop Schemes—Sketch of Motor Connections.

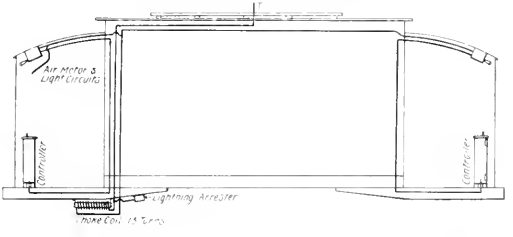
January, 1908.

Mileage, 183,380.4; oil, 317 gallons; journal grease, 220 pounds.

Cost of car oil per 100 car-miles	$0.03457
Cost of journal grease per 100 car-miles	0.00479
Total cost of lubrication per 100 car-miles	$0.03936

Motor Connections.

To afford the simplest possible guide for a repair man whose duties may require him to assemble a motor, pencil sketches are made showing by means of differently colored lines the motor connections. One such sketch is reproduced



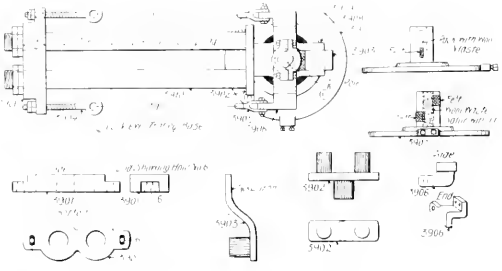
South Bend Shop Schemes—Connections for Lightning Arresters.

herewith and its simplicity is apparent. Similar sketches are furnished any employe who might, in emergency, be required to make motor connections. Each sketch is 12 by 7 inches in size, made on heavy paper, with one-half of the leads shown in black and one-half in red. In this way there is no chance for confusion. In the sketch presented herewith the red lines appearing on the diagram are reproduced dotted. The men about the shop are encouraged to make these and similar sketches and hand them to the foreman for checking.

In this way the employes become familiar with the wiring of the various equipments.

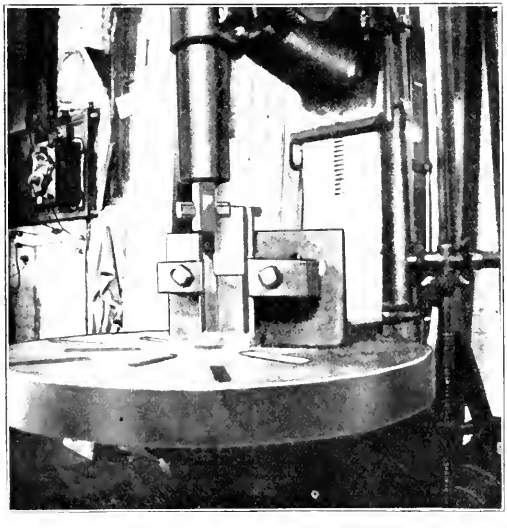
Setting Brush Holders.

To facilitate the accurate setting of brush holders a galvanized sheet iron templet is made in the form illustrated. The dimensions of this templet are such that when its straight side is set against the faced side of a motor case the upper semi-circle of the templet will come adjacent to the face of the pole pieces. Laid off on the templet is a 90-degree angle,



South Bend Shop Schemes—Parts of Rebuilt Trolley Base.

as shown. With the templet in place and carefully lined with the faced surface of the motor frame, punch marks can be accurately located 90 degrees apart on the two pole pieces if the punch is held at the ends of the radial lines on the templet. With the pole pieces so marked at each end a straight-edge can be laid along the two punch marks on each pole face and the brush holder opposite any particular pole

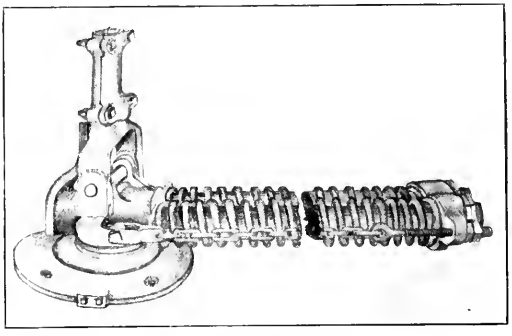


South Bend Shop Schemes—Finishing Journal Bearing.

accurately set. The templet shown herewith is made for a Westinghouse No. 49 motor.

Lightning Arresters on Cars.

It is quite generally the practice to use two lightning arresters, each of different manufacture, on one car. The method of connecting the main circuits with the arrester, overhead switches and choke coils is shown in an accompanying sketch. It will be noted that the main lead from the trolley is brought down at one end of the car direct to the choke coil with the lightning arresters mounted under the body of the car and tapped off at the positive end of the coil. Leaving the negative end of the coil the power wire passes up the corner post and divides to connect with the overhead switches in the two platform hoods. The long loop from the top of the car down to the choke coil under the platform

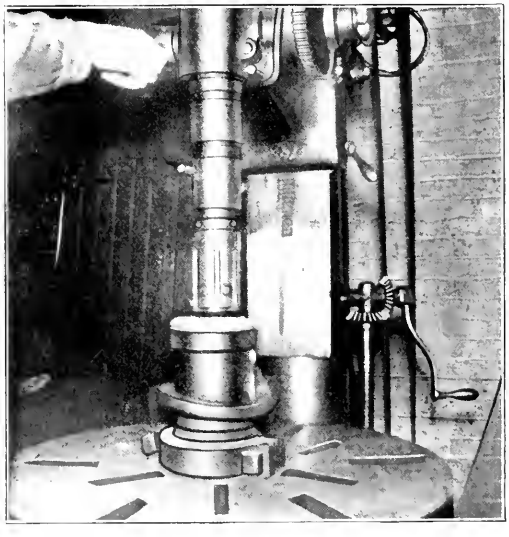


South Bend Shop Schemes—Trolley Base as Rebuilt.

and back materially assists in preventing lightning discharges from reaching the motor wiring.

Trolley Bases.

On the city lines the trolley wire is held from 18 to 20 feet above the track and at railroad crossings this height is increased to 23 feet. With some of the older trolley bases



South Bend Shop Schemes—Finishing Armature Bearing.

the tension becomes slack and therefore it was thought economical to reconstruct the bases as herewith illustrated.

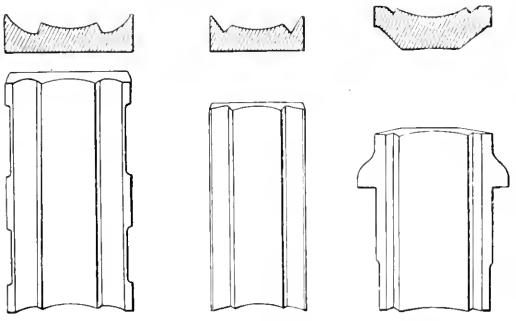
The old bases had two springs, one on either side of the center casting. In rebuilding these bases both of the springs were placed on one side and additional lengths of spring four inches long were added to the coils. The accompanying sketches will serve to show the completed trolley base with a double spring and the various detail parts required for rebuilding them. With the base as reconstructed no trouble

is had from bent poles, because the adjustment is such that the tension remains practically uniform throughout the raising and lowering of the trolley pole. The rebuilding of these trolley bases was done at a cost of less than $2.00 each.

Reference to the detail sketches will show the method of oiling the base. The interior of the post is filled with wool waste saturated with oil. This oil is conveyed to the bearing surface by means of pieces of felt fitted in openings cut through the side of the post. When so equipped it is necessary to oil the base but once a month.

Boring Bearings.

An ordinary drill press is used to bore both journal and armature bearings. In the chuck of the drill press is placed an adjustable reamer. A facing tool on the same stock serves to face the end and complete the surface finish in one operation when the reamer has passed fully into the bearing. The facing tool is ground to cut a fillet of the proper radius between the end face and inside surface of the bearing. No jig is used to hold the solid bearings, but a hook is slipped over the shell. The end of this hook fits in the hole in the bearing



South Bend Shop Schemes—Types of Crown Bearings.

shell and the other end rests against the drill post, thus keeping the bearing from turning.

The journal bearings are also finished on a drill press, being supported in a jig, as shown in one of the accompanying halftone engravings.

CENSUS OF ELECTRIC RAILWAYS.

The United States census bureau is taking the census of electric railways. The statistics relate to the year ending December 31, 1907. The canvass is made under the supervision of W. M. Steuart, chief statistician for manufactures of the census bureau. The form of report which has been issued for electric railways stipulates that "the answers in regard to financial matters, other than capitalization, will be held absolutely confidential; the separate reports will be combined so as to show totals for all companies in the different states. The information will be used only for the statistical purposes for which it is given." The list of companies to which requests for information have been sent contains the names of 2,190 companies, including subsidiaries, but many of the latter will be eliminated. In the previous census there were 987 operating and lessor electric railways.

The instructions issued by the bureau to special agents state in part:

The schedule is prepared primarily for railways operated by electricity. All classes of street railways, whether operated in whole or in part by cable, animal, steam or other motive power, and also interurban railways, must be reported on it.

When independent street railways have recently been combined under one ownership one report may be made for the operations of the entire system, provided the roads which were formerly operated as independent lines are located in the same city or immediate vicinity, but if the system of accounting will permit of the preparation of separate schedules, a separate report should be secured for each of the constituent companies.

The track reported must be given in single-track miles and decimals of a mile carried to two places. The statistics for miles of track must be shown by states.

Give the maximum and minimum weight per yard of the steel rails in use at the time of making the report. A girder rail weighs from 38 to 135 pounds to the yard; T-rails from 15 to 91 pounds per yard. These weights should be used by the agent only to detect wide variations, for which explanation should be made.

The answer to the inquiry concerning overhead electric line construction must show the length of construction. Considering all systems reported at the census of 1902 there were on the average about 52 poles to each mile of line. A wide departure from this average should be explained.

Car Mileage.

It is an ordinary practice for street railways to keep an account of this mileage. Where it is not known the car mileage can be estimated fairly well by ascertaining the number of round trips daily on each line or branch of the system and multiplying this by the length of the respective trips. The daily average should be multiplied by the number of days the road was in operation during the year to obtain the total for the period covered by the report. The earnings per car-mile should as a rule be between 10 and 40 cents.

The use of "trailers" is a source of confusion in computing car mileage. As a rule the individual car should be considered as the unit, but when the trailers are small and it is the practice of the company to consider the motor car and the trailer as one car in making the computation, the company's figures should be accepted.

The average number of fare passengers per car-mile in 1902 was 4.26; the cars were run, therefore, on an average, nearly one-fourth of a mile for each fare collected. An extreme variation from this average should be questioned and explained.

The inquiry, "car hours," is not obligatory, but is employed by some roads. Such roads, however, are large and the system of accounts is likely also to include the "car mile." At the census of 1902 the roads which reported car-hours indicated an average of 33 fare passengers per passenger car-hour.

Parks or Pleasure Resorts.

The agent must not include parks and pleasure grounds belonging to the community or other interests and entered by street railway systems; but if the company pays for the privilege of touching at these points, a memorandum should be made of that fact, and the number of passengers thus specifically delivered within such pleasure resorts should be noted, if possible, as distinguished from traffic on lines terminating outside public parks or running around them.

Financial Operations.

The office has adopted the system of accounting devised by the American Street and Interurban Railway Accountants' Association. The schedule used at the census of 1902 required a separate amount for each item under "cost of construction and equipment." The majority of the companies could not make the segregation and therefore only the totals are required at this census.

The combined balance sheets of all roads must result in showing the total capital stock and funded debt of both operating and leased roads, therefore the proportion of these securities which are owned by street or electric railways should be shown separately, so that a net figure for each kind of capital can be presented. Some companies may consider their own stock or bonds held in the treasury as an asset, but in making up the balance sheet such securities should be treated as not issued and should be omitted from both sides of the balance sheet statement. If there is a profit and loss deficit or if a large amount is reported for "other permanent investments," the reason for the loss and the nature of the investments should be given. Items such as "purchase of completed road" or "payment for franchise" must be included as "cost of construction, equipment and real estate" and not as "sundries" or "other permanent investments."

The Philadelphia Rapid Transit Company announces that Willow Grove park will be opened for the season of 1908 on Memorial day, May 30. Engagements have been made with Pryor's band, Victor Herbert's orchestra, the Theodore Thomas orchestra and Sousa's band to furnish the musical entertainment for the season.

SHORT TALKS WITH THE CLAIM INVESTIGATOR—III.

BY F. W. JOHNSON, ASSISTANT GENERAL CLAIM AGENT PHILADELPHIA RAPID TRANSIT COMPANY.

The average claim investigator does not begin to appreciate the unlimited possibilities to be derived from the use of tact, resourcefulness and originality in connection with his work among witnesses and claimants.

Webster defines "tact" as "a peculiar skill or faculty; nice perception; ready power of appreciating and doing what is required by circumstances."

The last two lines of this definition seem to be particularly applicable to the case in point. The ability to quickly grasp a situation and to formulate a plan of campaign applicable to the peculiar circumstances of each individual case is of the utmost importance in handling refractory witnesses or claimants.

It is a serious mistake for any investigator, no matter what his length of service in claim work has been, to attempt always to handle witnesses and claimants along identically the same lines. The various elements encountered in claim work have to be approached and handled in various ways, if good results are to be obtained, and it remains for the claim man to decide almost at a glance upon the proper course to pursue in opening up negotiations with each individual claimant or witness.

A knowledge of human nature is a valuable asset in this connection. Most men pride themselves upon being fairly accurate judges of human nature, to a greater or less extent, but the sad fact remains that if such they are, they derive but little actual benefit from their talent. The possession of this faculty is best manifested by an ability to put it to some practical use.

Necessity for Tact.

We see ample evidence of its absence in the person of the claim man who pursues the same stereotyped style in his work, day after day, making practically no changes or allowances for varying conditions, circumstances or individuals. He lacks adaptability in thus attempting to transact business with but a single mode of procedure, whether the claimant be male or female, professional man, business man or laborer. They all look alike to him, and the advantages possible through a change of tactics from time to time, to accommodate ever-changing conditions, are entirely overlooked.

As an illustration of this tendency we will take the case of X, who has been identified with claim work for some years. Nature set him up in business with a superabundance of self-confidence, which characteristic quickly becomes apparent in his interviews with claimants. With a certain type of people his breezy way of getting down to business acts like a charm, and not infrequently serves to sweep opposition aside as though it were so much chaff. The claimant readily falls into line and an amicable adjustment follows nicely and easily.

But then there is an entirely different class of people with whom X has to transact business. There is the claimant or witness, for instance, who carries a perpetual chip upon his shoulder and who fires up like a flash should any representative of the local traction company approach him in any manner other than that of a humble and lowly servant of the public.

This latter class of claimants frequently resents the brisk, breezy manner of Mr. X. They have a way of standing constantly upon their dignity and, besides, they haven't forgotten the fact that a certain conductor carried them a block beyond their destination summer before last. Whatever may be our own private opinion of such genial dispositions, the fact nevertheless remains that people of this stripe require delicate handling, if anything other than a cold turndown is to result from the interview. Unfortunately, X fails to appreciate this very fact. He neglects to shorten sail when dealing with people who don't take kindly to a good, hearty hand grasp and a cordial greeting. As a natural consequence, sparks fly, personalities are exchanged and the interview is over. Incidentally X fails to make good in so far as the desired release or statement is concerned.

As an instance of just the reverse, consider the style followed by investigator Z. He likewise has been associated in claim work for some years and, in so far as temperament is concerned, is virtually the opposite of X, being of a naturally retiring and reserved disposition. But he also has a stereotyped way of approaching and of handling his people, whether they be clergymen, bartenders, retired capitalists or members of the local cab drivers' union. He travels along a beaten path and, though storm signals may be flying, he fails to rise to the occasion by changing his tactics. As may be expected, he also is very successful with some people, while with others he proves a dismal failure.

In dealing with witnesses, and more particularly claimants, investigators should realize that the other fellow is hard at work "sizing up" the representative of the company from the moment when he first steps inside the door. Hence, if a man follows one certain style or method all of the time, in dealing with all claimants, he unconsciously grows mechanical in his work, neglects to make use of his ability to size up and to weigh his people, and in time becomes as an open book in the hands of shrewd claimants.

It is the ability to size up each individual batsman, and to serve him accordingly, that distinguishes the winning pitcher from the mediocre man. The "box artist" who possesses but one curve, or one style of delivery, cannot be expected to successfully compete with the versatile man who always has a variety of curves on hand, together with a deceptive change of speed, all of which are available for varying conditions.

It is much the same in claim work. The man who has but one style of approaching and of handling people, regardless of the circumstances surrounding each individual case, is unconsciously laboring at a disadvantage. With respect to the two illustrations cited, it is a self-evident fact that both men would have been stronger had they but appreciated the value of tact and of originality in their work among claimants and witnesses. With such an appreciation X at times would instinctively have adopted the style invariably followed by Z, and vice versa. Each lacked adaptability and his field of action as a claim man was thereby restricted unnecessarily.

A Clever Ruse.

There comes to mind an instance which occurred some years ago which, though of a somewhat unusual character, nevertheless bears upon the point in question. A certain investigator has unexpectedly been pressed into service as an adjuster. Upon the list of injured parties as supplied him appeared the name of a Mr. R.

The adjuster called upon Mr. R. talked shop for a while and soon found that he had a hard task before him. Negotiations were about to be stopped, when the adjuster laughingly suggested a friendly round or two with the gloves, having learned in conversation with Mr. R. that this pastime was a sort of specialty with him. Mr. R. readily assented and offered no objection to the adjuster's calling in a number of men from the immediate neighborhood to act as "an audience," as the latter jokingly put it.

The claim man proved to be nervy. Though he knew absolutely nothing about boxing, he nevertheless was willing to take a chance. He had no superfluous time to speak of, for Mr. R. kept him busy picking himself up off the floor. The next morning he arrived at the office with both eyes black. The facts eventually came out, the adjuster modestly observing that, while he hadn't been able to arrange for moving pictures of the mill upon such short notice, he nevertheless had taken the precaution to provide for a sufficient supply of witnesses to prove Mr. R.'s excellent physical condition as demonstrated with the gloves. Mr. R. afterward preferred

to adjust his claim for a reasonable figure, rather than to have the facts passed upon by a jury.

This example, though of a rather humorous nature, nevertheless fully illustrates the possibilities for "scoops" in claim work for the man who is resourceful, and willing to take a chance occasionally with new methods of procedure.

This recalls to mind still another example of originality and resourcefulness upon the part of an investigator, which took place some time ago. A claim of rather serious moment had been presented to the company, and after due investigation it had been adjudged a proper matter for settlement. Several men had been assigned to the case, without results, when it was finally placed in the hands of S.

An Example of Resourcefulness.

Bright and early the morning following S. walked confidently up the front steps of the claimant's house and rang the bell. Upon explaining his mission his reception proved even more distressing than he had anticipated, for, without further comment, the door was closed in his face with a slam. The unusually severe character of that "slam" gave him his cue upon the instant.

Whipping out his pocket handkerchief, he swiftly bound it around several fingers of his left hand, simulating meanwhile indications of intense agony, expressly designed for the benefit of the family, whom he knew full well to be just behind the closed blinds of the front room, from which vantage point they were prepared to witness his withdrawal.

A second handkerchief quickly followed, in order fully to stanch the flow of imaginary blood. Thus temporarily relieved, he again rang the door bell. Their curiosity aroused, the family hastened to respond. Controlling his suffering as best he could, he begged of them a few drops of arnica for his hand, explaining that the unexpected closing of the door had caught him unawares and had crushed two of his fingers.

He forthwith was invited into the house and supplied with arnica, with which he liberally dampened the handkerchiefs covering his hand. Apparently the arnica had a soothing effect, for a very pleasant hour's chat followed, during which the family were agreeably surprised to find, contrary to the opinions of ill-advised friends and neighbors, that the company's representative was only a good-natured, well-bred young business man, and not the desperado that had been pictured to them. Upon learning that the company stood ready to do what was fair and just in the matter, negotiations were opened up and the matter disposed of in a manner entirely satisfactory to all concerned.

While the incident entailed the employment of a little deception, it nevertheless was of a harmless character, and was undoubtedly justifiable in view of the rank discourtesy and unfairness displayed by the family in deliberately slamming the door in his face, without cause or justification.

Be versatile, original and resourceful in your work. Get out of the rut and stay out. Cultivate tact and diplomacy. Good business principles are just as applicable to claim work as to any other branch of commercial life.

In short, use your brain more, and your feet and hands less.

The United States consul at Pretoria, Transvaal, South Africa, reports that the town council of Pretoria is contemplating a change in the equipment of the street car line to electric power, and requests that American manufacturers of cars, overhead material and rails furnish information as to the probable cost of an equipment of from 9 to 15 miles. The council desires information as to cost per mile for track and overhead, and also cost per car for 10 or more. The type of car preferred is the ordinary light car that is used in the smaller cities of America. Letters and catalogues may be addressed to Dr. S. R. Savage, mayor of Pretoria, or to the American consul at Pretoria.

CLEVELAND STREET RAILWAYS LEASED TO MUNICIPAL TRACTION COMPANY.

The long controversy between the Cleveland Electric Railway and the city of Cleveland was ended on Monday night, when all of the details of the settlement under the holding company plan were finally arranged. As previously stated in these columns, the principal feature of the settlement consists of a lease of the entire street railway property of Cleveland to the Municipal Traction Company, a holding company representing the city, which has promised to operate the street railway lines of Cleveland without profit to itself at a 3-cent fare.

Since December 4, 1907, Mayor Tom L. Johnson, representing the city, and F. H. Goff, representing the Cleveland Electric Railway, have been engaged in determining upon a valuation of the Cleveland Electric Railway property as a basis for the lease. On Tuesday, April 21, Mr. Goff submitted a price of $55 a share, after deducting indebtedness. The mayor and the city council desired to submit the proposition to the people and during the remainder of the week 16 mass meetings were held in various parts of the city. The expression of the people was almost unanimously in favor of a settlement and on Monday the final details were arranged. During the day stockholders' and directors' meetings of the various companies involved were held for the purpose of approving the plan and all litigation between the city and the companies was dismissed.

Details of the Settlement.

The stockholders of the Forest City Railway took the necessary steps to transfer the property to the Cleveland Electric Railway and approved the purchase of the Low Fare Railway for $64,000. The lease of the Forest City Railway to the Municipal Traction Company, which was made on July 2, 1906, was canceled and the action taken last week in increasing the stock to $6,000,000 was rescinded.

Stockholders of the Cleveland Electric Railway met and reduced the capital stock from $23,400,000 to $12,870,000, the agreed valuation of the property at $55 a share, after deducting an indebtedness of $9,314,131. New stock is to be exchanged for the old at the rate of 55 shares for 100. After a recess during which the directors passed resolutions authorizing the lease to the Municipal Traction Company and the purchase of the Forest City Railway the action of the directors was ratified and authority was given to President Andrews and Secretary Davies to execute the contracts. An increase of capital stock to $35,000,000 was then authorized. The increase is to provide for the purchase of the Forest City Railway and to provide sufficient treasury stock to meet the cost of improvements and to retire certain outstanding bond issues. The stock of the Forest City Railway was acquired by exchange of stock at par for $1,805,600. It was then voted to reduce the number of directors from 17 to 7. The stockholders will meet again on June 2 to change the name of the company to the Cleveland Railway Company.

The valuation of the Cleveland Electric property as finally decided upon includes $17,112,098 for physical property, $4,976,701 for inside franchises and $95,332 for good will, leaving $12,870,000 as the value of the 234,000 shares of stock at $55 a share, after deducting the indebtedness of $9,314,132. No value was allowed for outside franchises.

At the meeting of the city council in the evening the plan of settlement was formally approved and the security franchise to the Cleveland Electric Railway was passed. Before the security grant was discussed communications were received from the Low Fare Railway relinquishing its franchises and from the Forest City Railway surrendering the franchises on Woodland avenue and other west side streets, which were granted on April 16.

An amendment was offered to the security franchise fixing the rate of ticket fares at six for 25 cents. A small

minority advocated seven tickets for 25 cents, but the ordinance was passed, under suspension of the rules, at the former rate. It will be remembered that the Cleveland Electric Railway's original franchise application last year was at the rate of seven tickets for a quarter. The change to six for a quarter was made in order to secure a better market for the new securities. The franchise runs for 25 years and is renewable every 10 years for a similar period. Provision is made for purchase by the city at the expiration of the grant. The cash fare is to be five cents. In return for the new franchise the Cleveland Electric Railway surrendered all its existing franchises. In case the Municipal company forfeits the lease the Cleveland Electric Railway may operate under the security grant. The ordinance was signed by Charles Lapp, the vice-mayor, Mayor Johnson having absented himself temporarily in order that the validity of the grant might not be affected by his connection with the holding company.

Certified copies of the lease and the security franchise were then exchanged and President Andrews formally turned over the property of the Cleveland Electric Railway to President du Pont of the Municipal Traction Company.

Municipal Traction Company.

At the conclusion of the peace arrangements on Monday night Mayor Johnson announced the increase of the directorate of the Municipal Traction Company from five members to nine by the election of himself, F. H. Goff, Newton D. Baker and B. T. Cable of Rock Island, Ill. The old members are: A. B. du Pont, Edward Wiebenson, C. W. Stage, Frederic C. Howe and William Greif. The board is self-perpetuating and each holds an equal amount of the capital stock of the company, which is non-transferable and is limited to $10,000. The company is to be operated without profit and any excess of net earnings over the 6 per cent required to pay the rental is to be applied either to a reduction in fares, improvements or to a sinking fund for the purpose of purchasing the property. The principal provisions of the lease under which the company will operate are as follows:

The lease runs for 50 years from January 1, 1908, and may be extended upon expiration for another 50 years. At any time during the life of the lease or a renewal the Municipal company or the city may purchase the property at 10 per cent above the par value of the outstanding stock, assuming the liabilities, or the Municipal company may assign the lease to the city. In case the Municipal company purchases the property it shall do so subject to the right of the city to purchase on the same terms plus the cost of any additional betterments, provided the city shall obtain the right of municipal ownership.

The Municipal company is to pay a rental of 6 per cent per annum on the outstanding capital stock of the Cleveland Electric Railway and an amount sufficient to pay the interest on the bonded and floating indebtedness. It is also required to keep a maintenance and renewal account to which will be credited each month and charged to operating expenses five cents per car-mile for the first year, 5¼ cents for the second year and 5½ cents for the third year, and thereafter until readjusted; also an accident reserve fund to which will be credited each month 0.7 cent per car-mile for the first year, 0.8 cent for the second year and 0.9 cent thereafter until readjusted.

At the request of the Municipal company the Cleveland Electric Railway shall issue and sell from time to time such capital stock as may be required to pay for additions and improvements, including $250,000 for repairs and renewals, $1,500,000 for track extensions and improvements, $1,350,000 for new rolling stock, $2,150,000 for new power houses and car shops and $1,500,000 for the construction of a high-level bridge across the Cuyahoga river.

Immediately following the transfer of the papers on Monday night the Municipal Traction Company took possession of the property. It was announced that on Tuesday, to celebrate the settlement, no fares would be charged, and that on April 27 of each year all passengers would be carried free. It was also announced that on Wednesday 3-cent fares would be charged, with no transfers. On Tuesday many of the details of the plans for operation were settled. It was announced that the transfers would be ready by May 7 and that for a short time at least one cent will be charged for each transfer. Eventually it is proposed to give universal transfers for a 3-cent fare. The 3-cent fare applies only to rides within the city. Passengers to or from points outside the city will pay five cents and receive a suburban fare receipt, which will be collected after passing the city limits.

Several changes in routing and schedules are being made and plans are being prepared for the reconstruction of some of the tracks. It is announced that the plan will be tried of stopping the cars only at every other street crossing. The motormen and conductors have been given an increase of wages of approximately one cent per hour, the scale being 22, 24 and 25 cents, according to length of service.

On Tuesday the directors of the Municipal Traction Company met and elected Mayor Johnson treasurer, to succeed William Greif. F. C. Stockberger was appointed purchasing agent and Lawrence Stockberger was appointed superintendent of power. Mr. du Pont will assume the duties formerly performed by Horace E. Andrews, president, and John J. Stanley, vice-president and general manager. It is stated that F. H. Goff will probably be elected chairman of the board of directors.

Most of the members of the Cleveland Electric staff will leave the city. Mr. Andrews will hereafter devote his time to the affairs of the Mohawk Valley Company, of which he is president.

The introduction of 3-cent fares on Wednesday was accompanied by a number of unforeseen difficulties. The motormen and conductors were dissatisfied with the increase of one cent an hour and threatened to strike unless granted the increase of two cents, which was promised them last year by the Cleveland Electric Railway in case of a settlement. Mayor McQuigg of East Cleveland was put off a car for refusing to pay more than three cents for a ride from his suburb to the city and brought suit to compel a 3-cent fare from Cleveland to East Cleveland, which he said is required by a franchise. A third trouble was caused by a scarcity of pennies to make change at the unusual rate.

Strength of Chain Links.

Bulletin No. 18, on "The Strength of Chain Links," by C. A. Goodenough and L. E. Moore, has been issued by the engineering experiment station of the University of Illinois.

A series of experiments on chain links and circular rings, covering a period of two years, has been made for the purpose of confirming or disproving a theoretical analysis of the stresses in links and rings. A comparison of calculated and measured distortions affords the desired test. The result of the experiments is a complete confirmation of the analysis. Having a reliable theory, the bending moments and maximum stresses are calculated for links of various forms and the results of such calculations are applied to the formulas for the loading of chains given by Unwin, Bach and Weisbach. It is shown that the usual formulas for chain loads give maximum tensile stresses of 33,000 to 40,000 pounds per square inch, and maximum compressive stresses of 60,000 pounds per square inch. New formulas for safe loads are proposed. The bulletin is concluded with four appendices giving in full the theoretical discussion which is the basis of the experimental work. This bulletin will be of special interest to all engineers and manufacturers who are concerned in any way with hoisting and transmission. Copies may be obtained upon application to the director of the engineering experiment station, Urbana, Ill.

METHODS RECOMMENDED FOR INCREASING ELEVATED RAILWAY SERVICE IN CHICAGO.

George Weston, consulting engineer, Chicago, has just submitted to the Chicago city council a report on the Union elevated loop.

The report describes the loop as at present operated and its "rush hour" capacity, and outlines changes that should be made which will increase its capacity in the number of cars per hour that can be passed through it.

The changes recommended are as follows:

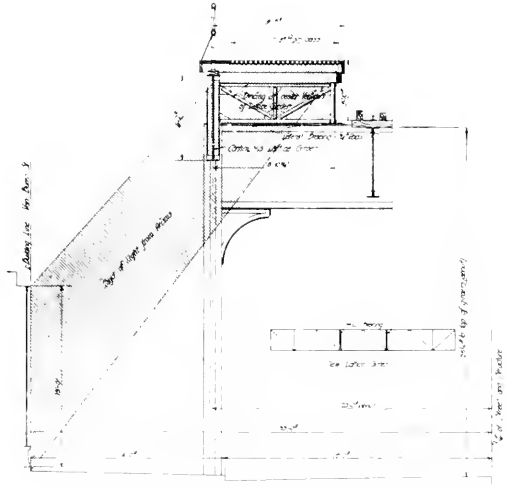
1. The through routing of cars between the Northwestern and the South Side companies.

2. The lengthening of the station platforms and the relocating of certain platforms with reference to the interlocking plants.

3. The introduction of universal transfers between the four companies.

The net increase shown by the calculations made amounts to 43 per cent over the present "rush hour" capacity of the loop.

Tables giving the probable increase in growth of traffic



Chicago Union Elevated Loop—Proposed Arrangement of Platform with Prism Glass Floor.

show that the future business will outgrow this resulting increase in capacity in the period between 1912 and 1915.

The through routing of cars is essential to the proper expansion of the downtown business district and this view of the necessity for through routing should be the underlying principle to bring it about.

Briefly, Mr. Weston says:

It is evident that the present elevated loop must be supplemented in the near future by additional facilities by which to take care of the rapidly increasing traffic. It is also evident that a complete and comprehensive plan must be devised to ultimately provide in a full and satisfactory manner for the traffic through the congested business district, and which shall tend to stretch out and enlarge this district, but it will take time to evolve and construct such a system and plans that can be put into immediate execution must be determined to furnish the immediate relief so much desired, and it is to the latter problem that the efforts of this report will be confined.

If the increased capacity to be attained by through routing were given entirely to the through routed cars the increase would be 100 per cent upon the number of trains through routed. On the other hand, if the advantage to be gained is used to loop additional trains the track capacity per hour will be increased but 50 per cent. In other words, for every train that is through routed per hour one additional train can be through routed per hour, and for every two trains that are through routed, one additional train may be looped, the percentage of gain being constant at this ratio.

Platforms.

The capacity of the elevated loop can be materially increased if the station platforms are lengthened so as to permit of two trains standing at the platform to load or unload at the same time, thereby eliminating the present extra stops that are required by reason of the trains not being able to run up to the station and make their station stop. The result of numerous observations taken during the rush-hour period shows that the average loss of time per train in making a complete run around the loop, due to these extra stops, is a little in excess of three minutes. The average rush-hour time for one trip around the loop is about 18 minutes. By lengthening the platforms and cutting out these extra stops this average time could be reduced to 15 minutes, thereby making a net saving of time of about 17 per cent. By saving this time more trains can be passed by a given point in a given period of time, hence the capacity is theoretically increased by that percentage. It is hardly possible that all of this time can be saved for the reason that trains will not always come in the proper sequence and, therefore, will not be able to make their station stop without some delay. But it is believed that 60 per cent of this increase can be obtained in practice if the stations are relocated and the track delays reduced to the minimum, which would mean a net increase of about 10 per cent over the present conditions.

The lengthening of the station platforms will also permit of the operation of 6-car trains instead of 5, which is the present maximum. The operation of 6-car trains will increase the number of seats per hour by 20 per cent and hence the capacity of the loop by the same amount. This increase of 20 per cent can be maintained up to the maximum number of 6-car trains that can be passed through the interlocking intersections per hour. The total net increase in capacity per hour due to lengthening the platforms as detailed above amounts to 30 per cent.

The lengthening of the station platforms brings up the question of obstructing the light and darkening the first story of business places adjacent to the platforms. Inasmuch as I am firmly of the belief that the platforms should be lengthened, if permanent or temporary relief to the loop is to be secured, the subject of light in connection with the station platforms has been given careful study with the result that by the use of prismatic glass the station platforms can be made a source of increased light through first-story windows, and instead of the platforms being an obstruction to the light they would be of assistance in lighting the stores or street beneath.

The application of prismatic glass to the station platforms will result in sending daylight into the adjacent stores from three to four times as far as would be possible if there were no elevated structure or any obstruction in the street whatever.

Increased Capacity.

The introduction of through routes and the lengthening of the station platforms would result in a net possible increase in the capacity of the loop of about 80 per cent if the capacity of the tracks of the Northwestern and the South Side lines connecting with the loop would permit increasing the number of 6-car trains 100 per cent over the number of 5-car trains that these companies now operate through the loop during the rush hour; and if the provisions of the lease proportioning the number of trains to each road would permit such increases.

The development of speed time curves and distance time curves proves that the minimum theoretical headway possible to operate 6-car trains on the main line double-track roads connecting with the loop, neglecting the block signals, is about 50 seconds.

It is not considered possible, however, to maintain this headway; the minimum headway is probably not less than 60 seconds.

This headway would limit the ultimate capacity of these tracks to 60 trains per hour entering the loop.

Therefore, taking this fact into consideration, together with the provisions in the lease, it is evident that these roads cannot utilize the full 100 per cent increase over the present number of trains that they have in operation and that the total increase in capacity in number of trains per hour as a basis cannot be taken at more than 60.

Summarizing the increases due to the improvements outlined in the report we obtain results which show the total rush-hour passengers, after allowing for all increases and correcting to the limitations of the governing conditions, to be 65,880, a net increase of 43 per cent.

In 1901 there were 22,839 steam locomotives in the United States. In 1906 this number had increased to 29,848

WELFARE WORK ON THE FT. WAYNE & WABASH VALLEY.

The value of keeping in close touch the various departments of an organization is well recognized. Frequent interchange of ideas between the heads of departments and the subordinate employes establishes a community of interest which it would be impossible to obtain by a mere issuance of instructions through the ordinary channels. That the element of personality enters into the management of a railway as in other industrial enterprises is acknowledged and therefore a practice that tends to bring out the individuality of a man, whether manager, superintendent, mechanic or section foreman, can result only in benefit both to the company and the employes. The Ft. Wayne & Wabash Valley Traction Company of Ft. Wayne, Ind., has adopted in its maintenance of way departmnt a series of "cabinet" meetings at which papers and discussions are presented by the officials and employes on subjects announced in a programme of the weekly meetings prepared several months in advance. As this method has worked out very satisfactorily on the lines of the Ft. Wayne system a brief description may be of benefit to others interested in promoting closer harmony between the department heads and the employes.

The employes of the maintenance of way department have been organized and divided into three sections or divisions as follows: The Ft. Wayne division, comprising all the employes at Ft. Wayne, on the Bluffton line, and as far west on the Ft. Wayne-Logansport division as La Gro; the Logansport division, comprising employes from Wabash west as far as Rockfield; and the Lafayette division, consisting of employes from Rockfield west to and including Lafayette.

The Ft. Wayne division meets every Tuesday evening at the chief engineer's office, H. L. Weber presiding and Mr. Johnston, his clerk, acting as secretary. The Logansport division meets every other Wednesday evening and the Lafayette division every other Thursday evening. By this arrangement the meetings do not conflict and anyone from any division can attend the meetings of the other divisions if he desires to do so. About once every four to six weeks there is a general meeting at Ft. Wayne and every section foreman on the entire system is expected to attend if possible.

At these meetings subjects of interest pertaining to the work are discussed and any foreman who desires material or help so reports, and ways and means for supplying his wants are discussed. Instructions are then given to the proper party to see that his desires are taken care of. For this year there has been outlined a course of "Topic Talks," by the general manager, heads of departments, section foremen and other employes of the company. On the occasions of the talks by the general manager or heads of departments a general meeting is held in the office of the chief engineer, and all foremen are expected to be present. Each meeting is presided over by a chairman and secretary and all meetings are conducted in a businesslike way. Typewritten copies of the minutes are kept, one copy being sent to the general manager, one copy placed on file and one copy sent to each of the chairmen of the other divisions.

As an example of the diversity of questions discussed we have chosen at random a few of the subjects assigned to the various representatives of the maintenance of way department, taken from a copy of the programme for the weekly meetings during the remainder of the year:

"Construction and Maintenance," by H. L. Weber, chief engineer; "Our Economics," by C. D. Emmons, general manager; "Tie Renewal and Best Methods to Adopt," by William Dolan, roadmaster; "Our Overhead System," by J. J. Brennen, chief lineman; "Roadbed Drainage," by John Gower, section foreman; "Our Relations," by R. T. Gunn, superintendent of transportation; "Right of Way Fences and Their Maintenance," by H. Bishop, carpenter; "How to Handle a Snowstorm," by John Betts, gang boss; "The Proper and Best Methods of Switch and Curve Greasing, Oils, Etc.," by Bert Arney, switch tender; "Our Equipments and Their Proper Use," by Lee Jacques, master mechanic.

As will be seen, the subjects covering all phases of the work on this system are presented by those having such work in actual charge and the benefits to be derived from such a method of interchanging ideas are obvious. We are indebted to H. L. Weber, chief engineer of the Ft. Wayne & Wabash Valley system, for this interesting information.

PLANS FOR BETTER BRAKES AND FENDERS IN NEW YORK CITY.

The total number of fatal and serious accidents upon street railways in Greater New York for the past six months has reached a number so great that the public service commission having jurisdiction over that district adopted on April 28 a resolution intended as the first step toward the reduction of accidents upon the different systems. In this resolution and the remarks of Commissioner Maltbie following it is interesting to note that in the minds of the commission a large number of cars operating in New York City are not properly equipped with either the best type of fenders or wheel guards or with brakes, either power or hand, of an efficiency that would warrant the most successful operation; and that in lieu of this fact a hearing will be ordered to show the advisability of submitting to the commission for approval types of such equipment specified for future rolling stock before it is ordered and placed in service. A blank issued to the railways requests a complete statement of the brakes and fenders now in use. The remarks of Commissioner Maltbie, containing a summary of the accidents since August 1, 1907, follow:

In the six months ending February 1, 1908, the street railways of Greater New York killed 299 persons and seriously injured 944. The total number of accidents due to collisions of street cars was 1,196 and the number of vehicles and persons struck by cars was 7,059. At this rate in an entire year about 600 persons will be killed and 2,000 seriously injured. The number of accidents due to collisions will approximate 2,400 and the number of persons and vehicles struck 14,000. From the standpoint of humanity this is a serious condition and ought not to be allowed to continue if there is any way to prevent it. There is another phase of the subject. For the year ending June 30, 1907, the street railways of New York City paid out for injuries and damages due to accidents over $2,500,000. Over one-half of this sum was paid by the Manhattan companies and one-third by the Brooklyn companies. Anything, therefore, which will reduce the number of accidents will not only be a blessing to humanity but will result in a saving financially to the companies.

It is probably true that even with the best devices that can be adopted and with the greatest of care it will not be possible to prevent accidents entirely, many of which will be serious and even fatal. But until the subject has been thoroughly investigated and every suggested remedy fully considered, our duty will not have been done, and it seems probable that the number of accidents can be very greatly reduced.

The most important factors in the prevention of accidents are brakes and fenders or wheel guards. Certain types of each are more effective than others, and in view of the high speed with which cars are run and in view of the congested character of many districts of the city it is essential that only the most effective types of brakes and fenders be used and that all of low efficiency be eliminated as rapidly as possible. Our division of accidents has investigated hundreds of cases and it is the opinion of the chief of the division, Mr. Daggett, that fully one-half of the accidents would be prevented if a brake of the high power and efficiency claimed for the magnetic track brake were in universal use. A large number of lives would be saved and injuries avoided if every car were equipped with the best type of fender and wheel guard.

I move, therefore, that the companies be directed to report the facts called for in the resolution I have just offered, that the electrical engineer be directed to report upon the relative efficiency of the various types of brakes, fenders and wheel guards used by the street railway companies under the jurisdiction of this commission, and that pending the submission of this report an order for a hearing be issued as to the advisability of requiring every company to submit to the com-

mission for approval the types of brakes, fenders and wheel guards to be used on all cars hereafter purchased before such cars are ordered by the companies.

CAR HOUSE FIRE PROTECTION.

F. E. Cabot, supervising engineer of the Boston board of fire underwriters, spoke before the New England Street Railway Club on April 23 on fire protection in car houses. He urged the more general investigation of all the small fires on cars and in the houses and pointed out the need of better organization for fire protection among car house employes. The prevention and control of fire is as important a problem as that of equipment maintenance and every car house foreman should be thoroughly versed in the best methods of protecting the property under his care.

Car houses are much better risks than formerly, especially since the peaked roof construction went out of favor. It should never be forgotten by the insurance man that the first problem in front of the street railway manager is not fire protection, but the operation of his road. By meeting on the common ground of remedying the smaller but none the less important defective conditions, the two parties in interest can get together.

A car house is not half as hazardous a risk as a cotton mill. There are many causes of car house fires and some of these can be easily prevented, such as leaving car heaters on at the high point, bad wiring in shops, accumulation of dirt around heaters, careless use of gasoline torches, corrosion of electrical connections and the practice of running cars into the house when there is an incipient fire in their bodies or in their wiring. The speaker urged the formation of a committee by the club to investigate and report the causes of all fires occurring in the territory controlled by the members, and stated that by attacking the problem in such a definite way much good would result, in the same way that the mutual insurance work of the New England cotton mills had proved such a lasting benefit.

With a reasonable supply of hose and buckets, extinguishers and an alert organization of car house employes, it ought to be possible in all but extraordinary cases to save a house once it gets on fire. The work done in the first few minutes is most important and the effort made to save cars by running them out of the house had better be expended in fighting the fire in the critical moments before the city department arrives.

Automatic Sprinklers.

Mr. Cabot spoke strongly in favor of the automatic sprinkler, both of the overhead and the aisle types. All fire apparatus needs maintenance as much as any other equipment, but it is used so seldom that this matter is very often overlooked. No sprinkler can be a success without plenty of water at good pressure, say 25 pounds per square inch at each head. As 15 or 20 heads may go off at once it is desirable to provide for the supply of at least 50 gallons per head per minute, or a total in a large house of 750 gallons per minute at 25 pounds pressure. Good feeling among the car service and pit men is a valuable asset, and the esprit de corps of the car house organization is of more value in the fire problem than all the automatic apparatus or appliances that can be put into the house. The speaker urged more frequent unexpected inspections and the fixing of definite responsibility for fire protection in each department.

It is a mistake to rely too much upon the use of incombustible materials in car house construction. It is no sign a material is fireproof because it will not burn. Concrete improperly mixed is a dangerous material and even a steel truss will melt and fall into the house, preventing the proper application of water and the saving of the rolling stock. Plain asbestos board when wet is a bad material for electrical insulating purposes and it is not generally known that this material has a heat conductivity one-fourth as high as iron or steel. A combustible substance, like the oil in a modern oil switch, is a safer material than a so-called "fireproof" construction of inferior quality. At a cost of about $7.00 per 100 square feet of car house area for sprinklers and a valuation of $7,000 per car, the balance is decidedly with the sprinklers, aside from the fact that in about eight or ten years the cost of the protection will be saved in the reduction in insurance premiums. The aisle head is valuable where it does not interfere with operating convenience or suffer damage from the moving parts of cars. The use of wired glass monitors, however, makes it hard to save a car by the aisle sprinkler, for the glass keeps the latter from doing any work inside the car until the roof falls in or the side windows give way.

In the short discussion that followed the address of Mr Cabot, John Lindall, Boston Elevated, cited the case of a car house fire that seemed to be caused by the removal of rail bonds from the special work in front of the house. A fire occurred in the night which could not be located until the floor was torn up. On inspection it was found that a track spike in the house had become red hot and burned a hole 6 or 8 inches in diameter in the timber under the floor. The spke was in contact with a grounded pipe and it was thought that the removal of the rail bonds outside the building temporarily caused a high difference of potential between the spike and the pipe. As a result the current flowing to the pipe overheated the spike. The stringer was an 8 by 10 inch hard pine piece and was soon set afire by the red hot spike.

F. F. Low, architect Boston Elevated Railway, gave the results of surprise tests made at the company's 25 car houses before the water was turned on for the warm season. In practically every case water was turned on to the hose line by the house organization in less than three minutes after the gong sounded. The quickest time was 1 minute and 20 seconds. Monthly fire drills are held in Boston.

EXTENSIVE CONSTRUCTION PLANS OF THE OREGON ELECTRIC RAILWAY.

The Oregon Electric Railway Company, whose new line from Portland to Salem, Ore., 51 miles, was described and illustrated in the Electric Railway Review of February 29, page 258, last week announced its plans for the construction of about 300 miles of new lines during the next three years in the Willamette valley. Amended articles of incorporation were filed increasing the capital stock from $2,500,000 to $10,000,000 and the directors met and authorized the following extensions: Salem to Albany, 18 miles; Garden Home to Hillsboro, 12 miles; Hillsboro to Tillamook, 57 miles; Tigardville to Eugene, 125 miles; Salem to Mill City, 54 miles; and Albany to Cascadia, 35 miles.

In a general way the extensions of the Oregon Electric Railway system will provide widely separated parallel lines up the Willamette valley from Portland, one on each side of the Willamette river, together with a main line running to the coast at Tillamook and a number of feeders and laterals throughout the territory reached.

From the Portland-Salem line a road will be built through Washington and Tillamook counties to Hillsboro and Tillamook bay. This line will tap one of the richest dairy and farming sections on the Pacific coast. From Tigardville, also on the Portland-Salem line, a main trunk road will be built through Washington, Yamhill, Polk, Benton and Lane counties, through Corvallis to Eugene. Another line will be built from Dallas to Salem and thence easterly through Marion county to Mill City. There will also be a road constructed from Albany, which will be reached by an extension of the main line from Salem, southeast through Lebanon to Cascadia.

The Willamette Construction Company, which built the Portland-Salem line, has already begun construction on the Garden Home-Hillsboro line and it is planned to begin work

on the Salem-Albany line some time this summer. W. S. Barstow & Co. of New York and Portland will have charge of the construction work.

Moffatt & White of New York are managers of the syndicate that is supplying capital for the Oregon Electric Railway. The officers of the railway are: President, George Barclay Moffatt, New York; vice-president, Guy W. Talbot, Portland; secretary, George F. Nevins, Portland; treasurer, H. W. Brower, New York.

REVISED BOSTON & EASTERN CONSTRUCTION ESTIMATES.

A hearing on the revised plans of the proposed Boston & Eastern Electric Railroad was held by the Massachusetts railroad commission on April 27. J. R. Worcester of Boston and R. A. Shailer of New York testified as experts on tunnel construction that the estimated costs of the proposed Boston & Eastern tunnel under Boston harbor in connection with the revised route to Postoffice square were reasonable and provided for a safe general design. The totals of the estimates as revised by the engineer, John H. Bickford, are given herewith. Earlier mention of this project has been made in the Electric Railway Review for July 20, 1907, page 72; September 28, 1907, page 379; November 2, 1907, page 737; and December 7, 1907, page 893. The hearing was continued until May 19 to enable Mr. Bickford to prepare data and testimony showing the difference between his proposed high-speed electric road, the existing street railways in the territory north of Boston and the Boston & Maine and Boston Revere Beach & Lynn steam roads in case the latter should be electrified in the future.

Estimate of Cost.

Grading, surfacing, tunneling, etc.	$ 1,241,900
Side and retaining walls	516,550
Ballasting with stone	207,000
Crossings over other railroads	228,100
Crossings at streets and ways	853,575
Crossings over waterways	265,150
Track and track equipment	334,620
Signaling system	100,000
Stations (exclusive of Boston terminal)	108,000
Seeding, sodding and fencing	32,750
Power station (8,000 kilowatts capacity)	800,000
Power distribution system	340,090
Substations (three, with 10,000 kilowatts total capacity)	300,000
Cars and car equipment (50, each with four 200-horsepower motors)	842,500
Car houses and repair shops	120,000
Harbor tunnel, subway and terminal	2,190,060
Engineering, interest and miscellaneous	1,049,000
Real estate	1,444,323
Total cost	$10,973,618

The cost as originally estimated was $8,754,960.

It is announced that engineering courses, laboratory practice and research work of interest to practicing engineers, contractors and graduates of technical schools will be given in the coming summer session of the University of Wisconsin, Madison, Wis., beginning June 22 and continuing six weeks. Work is offered in the following departments: Chemical, electrical, hydraulic, steam and gas engineering, mechanical drawing and machine design, mechanics and testing of materials, shop work. In addition to these engineering courses the eighth annual session of the Artisans' school will be held during the same period, in which instruction of more elementary type will be given in the larger portion of subjects noted above, this instruction being adapted to the requirements of students who have common school training or practical experience.

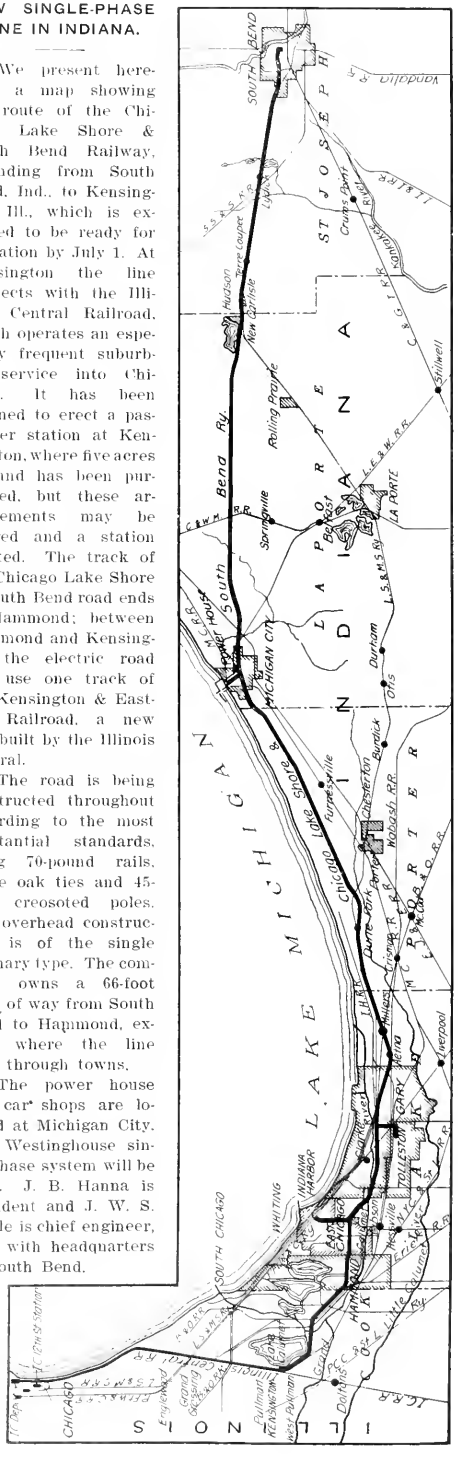
A contemporary devoted to the steam railway field describes an economical and rapid method of handling rails. The novel feature is found in the use of multiple rail hooks worked from the lifting chain of a derrick car. It is stated that by the use of these hooks as many as eight rails may be lifted at one time.

NEW SINGLE-PHASE LINE IN INDIANA.

We present herewith a map showing the route of the Chicago Lake Shore & South Bend Railway, extending from South Bend, Ind., to Kensington, Ill., which is expected to be ready for operation by July 1. At Kensington the line connects with the Illinois Central Railroad, which operates an especially frequent suburban service into Chicago. It has been planned to erect a passenger station at Kensington, where five acres of land has been purchased, but these arrangements may be altered and a station erected. The track of the Chicago Lake Shore & South Bend road ends at Hammond; between Hammond and Kensington the electric road will use one track of the Kensington & Eastern Railroad, a new line built by the Illinois Central.

The road is being constructed throughout according to the most substantial standards, using 70-pound rails, white oak ties and 45-foot creosoted poles. The overhead construction is of the single catenary type. The company owns a 66-foot right of way from South Bend to Hammond, except where the line runs through towns.

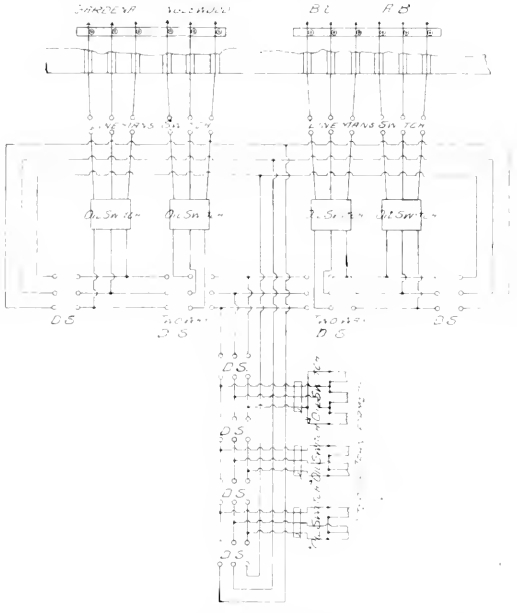
The power house and car shops are located at Michigan City. The Westinghouse single-phase system will be used. J. B. Hanna is president and J. W. S. Reigle is chief engineer, both with headquarters at South Bend.



Chicago Lake Shore & South Bend Railway—Map Showing Route of New Line Now Nearing Completion.

A SIMPLE HIGH-TENSION LOOP.

In the issue of the Electric Railway Review for September 14, 1907, page 302, was presented an extended description of the substations of the Los Angeles Railway. These substations, of which there are six, are electrically connected by a three-phase high-tension loop extending around the city



Los Angeles Railway—Detail Connections of High-Tension Loop Within Power House.

Particular care was used in designing the system so that it would afford the greatest assurance for continued operation, and the result is that the high-tension network may be completely destroyed between any two of the substations and yet all substations remain in operating condition. This transmission loop is fed by power purchased from the company which operates the water power property on the Kern river, more than 100 miles distant. The loop is also fed by a steam-driven generating equipment of 5,000 kilowatts capacity.

We present herewith a diagram of the high-tension connections in the steam generating station of the Los Angeles Railway Company. It is noted that there are four outgoing three-phase transmission lines, each or all of which may be fed by one, two or three of the three generating units. This very flexible arrangement of outgoing high-tension leads, which carry current at 15,000 volts potential, is made possible by the use of the 3-wire loop inside of the station.

It will be noted that as the current is taken from oil switches just outside of the step-up transformers, it is carried to the middle point of double-throw switches, these switches serving to throw each transformer onto one and only one side of a transformer loop. This loop is of three bare wires and feeds into either side of a similar 3-wire loop which electrically encircles the oil switches controlling the outgoing feeders. Each oil switch takes its current through a 2-way hand-operated switch, connecting it with the bare buses. Electrically outside of the oil switches and yet inside of the station are disconnecting switches for the linemen's use.

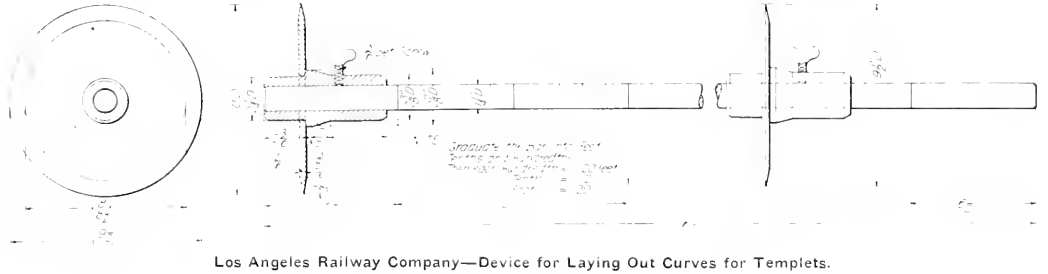
This combination of buses is built of line wire carried on high-tension insulators on a wooden framework inside the power house. The entire layout is not expensive and yet admirably serves the purpose of assuring continued operation, although any part of it may be disabled.

DEVICE FOR LAYING OUT CURVES OF LARGE RADIUS.

The Los Angeles Railway Company builds a large part of its special track work in a section of its repair shops. An illustrated description of this company's shops was presented in the Electric Railway Review for July 6, 1907, page 4. Through the courtesy of E. L. Stephens, master car builder, we present the accompanying engraving of a device utilized in the Los Angeles shops for laying out special work curves and marking out large curves for templets.

When it is desired to make a curve templet the relative position of the discs of the device illustrated can quickly be adjusted so that as they are rolled over the board from which the templet is to be cut the sharp edge of a disc will mark clearly a curve of predetermined radius.

The device essentially consists of a steel shaft $1\frac{1}{4}$ inches in diameter and 16 feet 1 inch long, carrying two snugly fitting sleeves provided with set screws. Shrunk on to these sleeves are discs of steel plate turned accurately to the given diameters. Each disc is beveled on the edge so that in rolling it will make a narrow mark. The shaft or bar is graduated into feet, tenths and hundreds. Inasmuch as one disc is $\frac{1}{2}$ inch larger in diameter than the other it is readily seen that when rolling freely the larger disc will travel faster than the smaller one and follow a curve of fixed radius. The radius of this curve depends upon the distance between the two discs and, as earlier stated, this distance is variable at will so that the discs can be set to follow a given radius. With the bar divided into feet, tenths and hundredths and with the discs 10 inches and $9\frac{1}{2}$ inches in diameter, the radius of the curve which the device will mark off varies 20 feet for each foot of variation in the distance between the discs. Likewise the radius varies two feet for each tenth and two-tenths foot for each hundredth of a foot of variation in the distance along the shaft between the discs. The demonstration of this relation between the radius of curvature which the discs will roll and the distance between the discs is a simple problem in proportion.



Los Angeles Railway Company—Device for Laying Out Curves for Templets.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR

One Running After Car and Falling in Trying to Board It Not Entitled to Damages.

Lee v. Rhode Island Company, 68 Atlantic Reporter, 475.—The supreme court of Rhode Island says that the evidence in this case preponderated against the verdict given the plaintiff. The testimony of all the disinterested witnesses who saw the accident tended to prove that the plaintiff ran after the car after it had started, and in trying to step upon it fell and received the injuries complained of. For this reason the court thinks the defendant was entitled to a new trial.

Duty Owed to Person Tendering a Transfer Not Accepted.

Lewyt v. Dry Dock East Broadway & Battery Railroad Company, 107 New York Supplement, 14.—The supreme court of New York, appellate term, says that the plaintiff testified that he boarded a Second avenue car at Eighty-sixth street and asked the conductor for a transfer to Grand street, which was given him and which was admitted in evidence; that he rode to Grand street and boarded a Grand street horse car operated by the defendant, and when his fare was demanded offered the transfer to the conductor, who said the "transfer was no good," and that he would have to pay another fare or get off. In the words of the plaintiff: "I told him that I would get off when the car stopped, and with his foot then he kicked the bundle off in the street, and he gave me a punch in the eye, and I fell from the car, and the goods were ruined." The defendant made no attempt to controvert this proof. Judgment was rendered for the defendant, and the plaintiff appealed.

It was urged by the defendant that the plaintiff could not recover damages, as he was not a passenger for hire. This position cannot be upheld. The plaintiff had boarded the car as a passenger, he had tendered in payment of his fare a transfer, and upon being told that the transfer was of no value, he expressed a willingness to leave the car as soon as it could be stopped. He was entitled to as much consideration from the servants and employes of the defendant as though he had actually handed the conductor the fare demanded. The defendant owed him the duty of either carrying him safely to his destination or affording him a reasonable opportunity to alight. Even if he had refused to pay his fare and had persisted in riding, his ejectment for nonpayment could only be accomplished by resorting to no more force than was actually necessary. Under the facts disclosed the plaintiff proved a cause of action, and the judgment rendered had absolutely no foundation. Judgment reversed, and new trial ordered.

Passenger Riding on Bumper and Getting Caught in Rope—Trolley Pole Slipping Off Wire.

Feldheim v. Brooklyn Queens County & Suburban Railroad Company, 107 New York Supplement, 413.—The supreme court of New York, appellate division, second department, says that the plaintiff was riding on the rear bumper of a crowded car. The trolley pole slipped off the wire and the rope attached to it caught the plaintiff about the shoulder and cast his head against the vestibule window, breaking the glass and inflicting slight injuries. He had often seen trolley poles come off the wire, and knew that, when that occurred, the rope went up with the pole. The conductor had collected his fare. The only witness who testified as to the speed of the car said that it was going 12 miles an hour.

It has frequently been held that it is not negligence per se (by itself) to ride upon the platform or running board of a crowded car, though even in such case the passenger assumes the usual risks incident to the position. But the court does not think there is any assurance from the company that a passenger can ride on a bumper with safety, even though his fare is accepted, because the position is so obviously dangerous that the law will not create an implied assurance of what the party must have known was not the fact. Rather than wait for another car, the plaintiff preferred to take the risk of riding in a perilous situation. By accepting his fare the defendant consented that he do that, and probably agreed that it would not by any affirmative act increase his peril, but it incurred no obligation to protect him from the obvious perils of the situation. The plaintiff should have known that he was likely to be caught by the rope in case the pole slipped off the wire. He voluntarily put himself in the way of that danger, and he was guilty of contributory negligence as matter of law. In any case the plaintiff could not recover damages and a judgment in his favor should be reversed.

Flying Up of Trap Door in Car.

Baum v. New York & Queens County Railway Company, 108 New York Supplement, 265.—The supreme court of New York, appellate division, second department, says that the trial judge stated in substance that the evidence that the trap door in the floor of the car flew open and struck the plaintiff, a passenger, was sufficient to make out a case to go to the jury, and that it required evidence from the defendant to show or explain the cause. This was correct as a rule of evidence governing the progress of the trial. The maxim that the thing speaks for itself applied; i. e., the flying up of the door raised a presumption that there was something wrong with the car by the defendant's negligence, and that presumption was evidence which made out a case for the plaintiff to go to the jury. The defendant was therefore required at that stage of the trial by the rules of evidence to put in any evidence which it had to show the cause of the occurrence—or, in other words, that the occurrence did not happen from its negligence—if it desired to do so.

Getting Down Backward from Vehicle at Side of Track—Extension of Rule as to Looking and Listening.

State, to use of Carey and others, v. Cumberland & Westernport Electric Railways Company of Allegany County, 68 Atlantic Reporter, 197.—The court of appeals of Maryland says that the man struck in this case by a car was struck by it while in the act of stepping down backward from the hub of a wagon wheel toward, if not upon, a railroad track but two feet distant from the wheel, without taking the slightest precaution to ascertain whether a car was approaching. He could have seen the car in time to save himself if he had simply turned around and looked for it. He must have been familiar with the proximity of the railway tracks to the public road, as he resided in the immediate neighborhood. Furthermore, he had been riding along the public road in full view of the railway track just before the happening of the accident which cost him his life. The court is of the opinion that the case was properly taken from the jury.

It has long been the settled law in Maryland that it is negligence per se (by itself) for any one to attempt to cross the tracks of a railway without first looking and listening for approaching trains and stopping to look, if the view be obstructed, and if he neglect these precautions and is injured by collision with a passing train, which he might have seen if he had looked or heard if he had listened, he will be presumed to have contributed to the occurrence of the accident, and unless that presumption be overcome, he cannot recover for the injury. It has been held that this proposition applies to attempts to cross suburban electric railways. It must upon principle be held applicable also to attempts to go upon a railway track or so near to it as to come into collision with a passing train or car. If the injured party in such a case is debarred by his negligence from recovering damages for the injury, it necessarily follows that no suit can be maintained for the benefit of his representatives if his injury prove fatal.

News of the Week

Legislation Affecting Electric Railways.

District of Columbia.—Representative Madden has introduced in the house a bill to compel the street railways of Washington to equip their cars with air brakes within a year under penalty of $200 per car.

New York.—On April 22 the senate passed a bill introduced by Senator Frawley authorizing the city of New York to purchase the Belmont tunnel at a price to be agreed upon by the city and the owners of the property.—The senate also passed the Robinson bill, which was passed on April 21 by the assembly, as reported in last week's issue, permitting the granting of franchise for subway construction and operation to private corporations.

Ohio.—The Werty bill, providing for initiative and referendum votes on municipal legislation, which was passed by the house last week, was reported to the senate on April 23 by the committee on municipal affairs, with several amendments.

Chicago City Council to Consider Subway Plans.

Mayor Busse of Chicago on April 27 sent a message to the city council urging it to take up at once the consideration of plans for building a subway to supplement the already overcrowded transportation facilities of the city. The mayor pointed out that the plans for subways should be made so broad and comprehensive as to provide for development and extension to meet the conditions of increased traffic which will be created by future growth of the city and to provide for the solution of several problems relating to the disposal of water mains, sewerage systems and underground wires. He recommended that the entire matter be referred to the committee on local transportation and that the committee be authorized to employ expert assistance.

The message was referred to the committee and a meeting was called for Thursday, April 30, to consider the subject. It is announced that the committee will at once proceed to secure all the information possible on the subject in order to determine upon the most feasible plan. It already has before it two reports submitted by Bion J. Arnold, one in 1902, dealing with a comprehensive subway system, and one in 1906, providing for a temporary loop in the central district. It is believed that there are no important engineering obstacles to be met and that the principal difficulty will be in financing the enterprise.

Strikes in Pensacola and Chester.

The strike of the motormen and conductors of the Chester (Pa.) Traction Company, which was caused by a reduction of wages, as reported in last week's issue, is still in progress. The cars are being operated regularly by strike-breakers, but there is little travel on account of the boycott declared by strike sympathizers, and general business in Chester has been greatly interfered with. Small disturbances by the strikers have been frequent and several attempts have been made to wreck the cars. President Rigg has offered to take back the old employes as individuals and a few have responded, but he has declined to treat with the union or to increase the wages. A portion of the state militia has been withdrawn from the city. On April 27 a delegation representing the board of trade and the carmen's union went to Washington to confer with the commissioner of labor and the interstate commerce commission in regard to an arbitration of the difficulty under the Erdman law.

The strike of the employes of the Pensacola (Fla.) Electric Company has been attended with several severe riots and the company has been able to operate its cars only with the protection of the state troops and special policemen. Cars were operated at night on April 25 for the first time since the strike was declared. The federal court at Pensacola has issued an injunction restraining the members of the union from interfering with the operation of the cars.

American Institute of Electrical Engineers.

The annual meeting of the American Institute of Electrical Engineers will be held on Tuesday, May 19, in the Engineering Societies building, New York City. The following papers will be presented: "Comparative Tests of Lightning Protection Devices on the Taylor's Falls System," by J. F. Vaughan; "Studies in Lightning Performance, Season of 1907," by N. J. Neall.

The annual convention of the institute will be held at Atlantic City, N. J., June 29 to July 2. The programme includes the following papers: "Voltage Ratio of Split-Pole Converters," Comfort A. Adams; "A New Large Generator for Niagara Falls," B. A. Behrend; "Relation of the Manufacturing Company to the Technical Graduate," B. A. Behrend; "Experimental Observations of Electrical Stresses Caused by Arcing Grounds," Ernst J. Berg; "Steam-Turbine Plant: Some Possibilities Resulting from Recent Engineering Developments," J. R. Bibbins; "Thirty-Day Test on Producer Gas Power Plant: Discussion of Results in Relation to Cost of Power," J. R. Bibbins; "Three-Phase Power Factor," Austin Burt; "A New Method for the Design of Alternators," Carl J. Fechtheimer; "Conductor Rail Measurement," S. B. Fortenbaugh; a paper on certain features of the Southern Power Company's system, J. W. Fraser; "Notes on Electric Locomotive Tests," George Gibbs; a paper on electric fire hazard problems, C. M. Goddard, representing the National Fire Protection Association; "Graphic Treatment of the Rotating Field," R. E. Hellmund; "An Imperfection in the Usual Statement of the Fundamental Law of Electro-Magnetic Induction," Carl Hering; "Ventilation of High-Speed Alternators," Albert Kingstung; "Modern Developments in High-Speed Motor-Generator Sets," F. D. Newbury; "Relation of the Manufacturing Company to the Technical Graduate," L. A. Osborne; "A Minimum Work Method for the Solution of Alternating-Current Problems," Harold Pender; "The Design of High-Tension Water Power Stations," D. B. Rushmore; "Relation of the Manufacturing Company to the Technical Gradnate," D. B. Rushmore; "The Fundamental Considerations Governing the Design of Transmission Line Structures," D. R. Scholes; "The General Equations of the Electric Circuit," C. P. Steinmetz; "On the Economical Location of Substations in Electric Railways," Gerard B. Werner; "From Steam to Electricity on a Single-Track Road," J. B. Whitehead; "The Application of Storage Batteries to the Regulation of Alternating-Current Systems," J. Lester Woodbridge.

Other papers are being arranged for by the high-tension, the railway and the educational subcommittees.

Philadelphia Subways.—At a meeting of the Engineers' Club of Philadelphia on May 2, S. M. Swaab presented a paper on "The Construction Methods on Section 6, Market Street Subway."

Western Society of Engineers.—The next meeting of the Western Society of Engineers will be held in the Monadnock block, Chicago, on May 6. Prof. J. C. Thorp will present a paper on "Recent Development in the Steam Turbine."

The Analysis and Grading of Creosotes.—The forestry service of the United States department of agriculture has just issued Circular No. 112, by Arthur L. Dean and Ernest Bateman, which includes data and methods regarding the analysis and grading of creosotes.

Accidents in Ontario.—According to a report of the Ontario railway and municipal board 32 persons were killed and 320 injured by electric railways in Ontario during the year 1907. Of those killed 7 were passengers, 7 were employes, 1 was a trespasser and 17 were pedestrians.

Fox River Valley Railway and Lighting Association.—A meeting of the recently organized Fox River Valley Railway and Lighting Association was held on April 25 and 26 at Fond du Lac, Wis. E. H. Haughton, general manager of the Bryan Marsh Lamp Company, Chicago, presented a paper on "The Tungsten Lamp."

Air Brakes Required in Portland.—The city council of Portland, Ore., has passed an ordinance requiring the Portland Railway Light & Power Company to equip all of its cars over 35 feet long with air brakes within one year. The ordinance also provides that no additional cars less than 35 feet long shall be installed on the Portland lines.

"Jim Crow" Signs to be Removed in District of Columbia.—The commissioners of the District of Columbia have requested the steam and electric railways to either remove or cover while operating within the district the so-called "Jim Crow" signs, designating separate seats for white and colored passengers, which are required by the laws of Maryland and Virginia.

Chicago Trainmen Ask Wage Increase.—The motormen and conductors of the Chicago Railways Company on April 28 voted to present a demand for increased wages at the expiration of the present contract on May 31. The present scale is 23 cents an hour for the first six months, 25 cents for the next six months and 27 cents thereafter. The proposed new scale is the same for the first year and 33 cents an hour thereafter instead of 27.

To Order Increased Service on Brooklyn Rapid Transit Lines.—The New York public service commission is planning to issue an order to the Brooklyn Rapid Transit Company, effective on June 1, to operate enough cars on the Broadway division to give each passenger a seat. At a public hearing

on April 27 A. N. Dutton, superintendent of transportation, said that the company could readily comply with the order except on Sundays and in rush hours, but that it would be difficult to do so at those times.

No Reindictments for Charleston Accident.—The Coles county grand jury, sitting at Mattoon, Ill., has decided unanimously not to consider in any way the matter of the interurban accident on the line of the Central Illinois Traction Company near Charleston, Ill., last August, for which the officers and directors of the company were indicted. The indictments were quashed by Judge Thompson of the Coles county district court on February 24, in a decision which completely freed the officers and directors from personal responsibility for the accident. The state's attorney endeavored to have new indictments voted.

Serious Accident at Ypsilanti.—A serious accident occurred on April 28 on the Detroit Jackson & Chicago Railway, a part of the Detroit United Railway system, when a limited car running between Ypsilanti and Detroit collided head-on with a local car near Ypsilanti, killing nine persons, including the motorman of the limited car, and injuring a large number of others. Both cars were running at a high rate of speed and the limited telescoped the lighter car. The schedule had been changed the day before, so that the limited left Ypsilanti 10 minutes earlier than usual and the reason given for the accident is that the motorman failed to stop at the siding where he was to have met the local car.

American Institute of Electrical Engineers.—At the last meeting of the Minnesota branch of the American Institute of Electrical Engineers, held in Minneapolis on Monday, April 20, 1908, the recent institute paper of Henry Floy, entitled, "The Engineer's Activity in Public Affairs—Public Utility Commissions and Franchise Valuations," was discussed from the standpoints of the independent and commercial engineers. Charles L. Pillsbury presented the subject from the independent engineer's point of view. Representatives of the Minneapolis General Electric, Twin City Rapid Transit and various telephone, gas light and telegraph companies, presented the subject from the commercial engineer's viewpoint.

Wages Reduced in Pittsburg.—The Pittsburg Railways Company has announced a decrease of wages of approximately one cent per hour, effective on May 1. In a bulletin announcing the decrease the company states that it has increased wages 33 per cent since January 1, 1902, and that the decrease is made necessary by the business depression. An announcement of a proposed reduction was made about a month ago, and after several conferences the proposition was submitted to a committee of arbitration, composed of one man selected by the employes, one by the company and the third by the first two. The third man has not yet been agreed upon. The bulletin states that the reduction will continue in effect to May 1, 1909, unless the arbitrators agree on a scale; in that case the agreed scale will be put into effect as of May 1, 1908.

Improvements in Brooklyn Bridge Service.—Mr. Bassett of the New York public service commission has submitted a report to the commission on the recent improvements in the surface car service on the Brooklyn bridge. The report shows that the cars of the Coney Island and Brooklyn Railroad have been largely responsible for delays to traffic. The bridge delays on the Brooklyn Rapid Transit lines have been reduced from 1,060 minutes in September to 385 minutes in March. During March 133,000 surface cars crossed the bridge, an increase of 11,000 over the number for September. At this time one year ago the largest daily number of surface cars that crossed the bridge was approximately 4,000. Today it is approximately 4,700. At this time a year ago the average number of surface cars crossing the bridge between 5 and 6 p. m. was 236. Today it is 310.

American Society of Mechanical Engineers.—The next meeting of the American Society of Mechanical Engineers will be held Tuesday evening, May 12, in the Engineering Societies building, New York. The paper will be by Henry Souther of the Henry Sonther Engineering Corporation, Hartford, Conn., on the subject of "Clutches," with special reference to the types used on automobiles. Their development will be shown by lantern slides. The meeting will be important, not only to those directly interested in automobile construction, but to all who have to do with the use of clutches for machine tool work, power transmission, hoisting machinery, textile and other classes of machinery. The meeting will afford an opportunity for the full discussion of their design and use. The discussion will be continued at the semi-annual meeting of the society at Detroit, Mich., June 23-26.

The first single-phase electric railway in England has just been put into operation. This new installation is for experimental purposes.

Traffic and Transportation

Baggage and Express on Illinois Traction System.

The following rules govern baggage and express handling on the lines of the Illinois Traction System:

"Baggage.—On local cars, baggage and light express handled between all points; on limited cars, baggage handled between terminals only; on 'Corn Belt' limited, baggage handled from and to Springfield and East St. Louis only, but no express is handled on these cars; charge on baggage, 25 cents per piece between any two points on the system.

"Express.—When handled on passenger cars, at shipper's request, regular express rates are charged. When handled on regular express cars, which are scheduled over each division of the road, the rates are the same as charged on the steam roads, based on the Illinois railroad and warehouse commission classification and distance tariff."

Not Required to Stop at Street Crossings.—The city council of Circleville, O., recently passed an ordinance requiring the Scioto Valley Traction Company to stop its cars at street intersections wherever passengers desire. The company appealed to the courts and was defeated in the lower court. The Ohio supreme court last week rendered a decision reversing the lower court and declaring the ordinance illegal.

United Traction Company of Albany Answers Fare Complaint.—The United Traction Company of Albany has filed with the New York public service commission, second district, an answer to the complaint of residents of Watervliet, regarding the 10-cent fare between Watervliet and Albany. The company states that the 10-cent fare is not discriminatory against Watervliet, as the same fare is charged to Albany from all of the other cities and towns north of the southern boundary of Watervliet and that the citizens of Watervliet are given the same right as to transfers as residents of Troy, Cohoes and Waterford.

Transfer Decision in New York.—The New York court of appeals, in a decision rendered on April 24, decides that a street railroad company has the right under Section 104 of the railroad law relating to transfers to regulate by any reasonable limitation the carriage of a passenger upon its line for a single fare. The case at issue, that of Peter C. Kelly against the New York City Railway Company, arose out of the refusal, in accordance with the rules of the company, by a conductor on the Eighth avenue line to accept "a southbound transfer upon a northbound car." Commenting upon the facts recited, Judge Gray points out that, under the construction of the law contended for by the plaintiff, "a passenger would be able to accomplish a round trip on the defendant's line for one fare."

Protest Against Universal Transfer Scheme in Richmond, Va.—William Northrop and Henry T. Wickham, receivers for the Virginia Passenger & Power Company of Richmond, Va., have sent a letter to the board of aldermen of Richmond, asking that they be heard with reference to a pending ordinance which would require the issue of universal transfers. The receivers state that the ordinance, in their judgment, would be in violation of contract rights and obligations between the city and the respective companies, which companies are absolutely separate and distinct, with separate stock ownership and bonded indebtedness; that it would entail practical difficulties in operation; and, above all, that it would seriously affect the financial interest of one, at least, of the companies to the hurt of its creditors.

Handling Intoxicating Liquors.—The Grand Rapids Holland & Chicago Railway has filed an amendment to the freight tariff with the Michigan railroad commission, refusing to accept shipments of beer, wine or spirits to Holland, Mich. Holland went "dry" at the recent election. Charles A. Floyd, general passenger and freight agent, said: "While there are probably no legal obligations upon us to discontinue hauling intoxicating liquor to Holland, and while there may be legal obligations on our part to handle that traffic, we realize that through the shipment of spirits over our line it would be easy for citizens of Holland to secure intoxicating liquor. It is evident that the citizens of Holland do not want the liquor business continued and it is our purpose to add our support to prevent the use of liquor there as far as possible. It is possible that the case may be decided by the courts, as it is a question whether the railroad commission can accept the schedule as amended. One of the acts of the last legislature provided for the exchange of business between steam and electric roads and the making of joint rates. It will be for the courts or the commission to decide whether our line can refuse shipments of liquor to Holland delivered by other lines."

Construction News

FRANCHISES.

Aberdeen, S. D.—I. A. Weaver of Huron, S. D., has applied to the city council for a franchise to construct terminals for an interurban line in Aberdeen. The road will be 52 miles long, with terminals in Aberdeen and Huron, and work will be started as soon as the franchise is granted. It is stated that terminal franchises have been secured in Huron.

Argenta, Ark.—An extension of time in which to complete its proposed electric line in Argenta has been granted to the Argenta Railway Company.

Bluefield, W. Va.—A franchise has been granted to the Bluestone Traction Company to extend its lines on Bland, South, North and Jefferson streets.

Charlotte, N. Y.—The village board of Charlotte has granted a franchise to the Rochester Railway Company for the construction of a 200-yard loop from the Hotel Arundell around the American Cottage. In consideration of the privilege it is stated that the railway company will at once reduce the fare between Rochester and Charlotte. Work on the loop is to be started immediately.

Evansville, Ind.—The Evansville Suburban & Newburg Railroad Company, Evansville, Ind., has applied to the city council for permission to enter Evansville over Lincoln avenue and to the county commissioners for a new right of way through the county.

Goldsboro, N. C.—The board of aldermen has granted a franchise to T. Oliver and associates to build a 2-mile electric line in Goldsboro.

Ithaca, N. Y.—The Ithaca Street Railway Company has again applied for a franchise to double-track certain sections of its lines and to build a single track around the square included in South Tioga, Green and Cayuga streets. The former application, which was refused by the city, provided that a payment of $10,000 be made to the city. In its place the company now offers to give the city $500 a year for 50 years and $750 a year for 49 years thereafter with the understanding that the franchise be for 99 years. This would make a total payment to the city of $61,750.

Nazareth, Pa.—The Allen Street Railway Company of Bethlehem, Pa., has been granted a franchise in Nazareth.

Pavilion, N. Y.—The commissioner of highways has granted the Rochester Scottsville & Caledonia Electric Railroad Company permission to cross certain highways in Pavilion.

Redlands, Cal.—The Redlands Central Railway Company has applied for a franchise to build an electric line from the limits of Redlands to Redlands Junction, two miles. This work has been planned by the company for some time, but has been delayed on account of opposition by property holders along Brookside avenue, the proposed route of the line. The new line will connect Redlands with the main line of the Southern Pacific by trolley instead of by a gasoline line motor as heretofore. It is stated that this will also be part of a proposed road from Redlands to Riverside.

Seattle, Wash.—The Seattle Electric Company has applied for a franchise to extend its Alki Point line from the present terminus to a point about half a mile south of Alki Point. It is stated that property owners have subscribed $25,000 to the bond issue of the company and donated the right of way for the extension. Work will be started as soon as the franchise is granted.

Sioux City, Ia.—The Sioux City Traction Company has applied for the renewal of several street railway franchises in Sioux City. A special ordinance has been drawn and the council has been asked to call a special election. The company has withdrawn its offer to build overhead tracks over Wall street, but will contribute $25,000 toward building a general viaduct.

Springfield, Ill.—The Springfield Consolidated Railway Company has been granted permission to lay a double-track line in North Grand avenue from Rutledge street to West Grand avenue. An amendment to the franchise as originally applied for makes the expiration limit co-existent with the Rutledge street franchise, under which the company has been operating.

Weston, Ore.—E. S. Isaacs, representing the Washington-Oregon Traction Company of Walla Walla, Wash., has been granted a franchise [illegible] Water street north and south through the [illegible] Weston, Ore. The company now has right [illegible] distance up Pine creek to Weston, also [illegible] The road was incorporated last fall to build [illegible] electric lines from Walla Walla south into Oregon.

RECENT INCORPORATIONS.

Champlain & Sanford Railroad, Albany, N. Y.—[illegible] ated in New York with a capital stock of $50 [illegible] a steam or electric railroad from Addison Junction [illegible] Sanford Hill, N. Y., 18 miles. Incorporators: Charles M. Hyatt, Andrew Thompson and James McN. Thompson, all of Albany.

Laurel Railway, Damascus, Va.—Incorporated in Virginia to build a 5-mile railroad in Washington county. Capital stock, $5,000 to $10,000. Incorporators: A. A. Mock, president, Damascus; G. W. Clements, vice-president, and F. G. Clements, treasurer, both of New York; B. W. Mock, secretary, J. F. Rhea and C. A. Baker, all of Damascus, Va.

Red Oak & Northwestern Interurban Promotion Company.—Application has been made for a charter in Iowa to promote the construction of an electric railway from Red Oak to Des Moines, Ia., 106 miles. The road as planned will start at Red Oak and pass in a northeasterly direction through Milford, Fontanelle, Greenfield, Stuart, Redfield, Adel and Waukee to Des Moines. It is stated that the line will be financed by local capitalists in the towns and cities served. Capital stock, $10,000. Incorporators: B. B. Clark, president, Red Oak; G. W. Curtis, vice-president, Redfield; M. N. Spencer and L. D. Goodrich, secretary and treasurer, respectively, Red Oak, Ia.

Schuylkill & Dauphin Traction Company.—This company has applied for a charter to build an electric railway connecting the principal towns in Lykens valley and western Schuylkill county, Pennsylvania. Incorporators: J. W. Moyer, Edgar D. Rank, Malcolm G. Stewart, Louis H. Schappell and N. D. Yoder.

Seattle Snohomish & Everett Railway, Seattle, Wash.—Incorporated in Washington to build an electric railway from Seattle to Everett by way of Bothell and Snohomish. The preliminary surveys have been made and engineers are now laying out the permanent route. It is proposed to build the first section of the road from Seattle to Bothell, 12 miles, during the summer, with as much additional mileage as can be completed before winter. Stock has been subscribed by land and timber owners along the proposed route and it is stated that work will be started at once. Capital stock, $500,000. Incorporators: C. W. Kimball, J. H. McLaughlin and Clyde C. Whittenden, all of Seattle, Wash.

Stillwater Power & Railway Company.—Incorporated in Montana to build an electric railway from Billings to Cooke City, Mont., by way of Columbus, with branches to Yellowstone, Sweet Grass, Carbon and Park counties. It is stated that work will be started soon. Capital stock, $3,000,000. Incorporators: Willard Bennett, Helena; George H. Savage, W. E. Defressee and E. E. Congdon, Butte, Mont.

Taylorville (Ill.) Electric Railway.—Incorporated in Illinois to build a street railway in Taylorville at a cost of about $130,000. It is stated that the company has purchased a tract of land at one end of the proposed line, which it will equip for a summer park.

TRACK AND ROADWAY.

Birmingham & Gulf Railway & Navigation Company, Birmingham, Ala.—This company, which proposes to build from Gadsden to Tuscaloosa, Ala., has recently begun construction at Tuscaloosa, and it is reported that construction will begin near Gadsden in a short time. J. M. Dewberry, Birmingham, Ala., is president. (Noted September 28, 1907.)

Brantford (Ont.) Street Railway.—It is reported that work will begin about May 1 on the double-tracking of the principal lines in Brantford.

Brownsville Masontown & Smithfield Street Railway, Masontown, Pa.—Construction work was started last week on the line from Brownsville to Smithfield, Pa., 20 miles, between Brownsville and Masontown. The contract was awarded to the Pennsylvania Railroad Construction Company. W. J. Sheldon of McKeesport, Pa., is president and E. C. McCulloch of Uniontown is chief engineer. (Noted February 15.)

Buffalo Lockport & Rochester Railway, Niagara Falls, N. Y.—It is reported that construction on the line between Rochester and Albion, N. Y., is now completed except for a portion of the overhead work and that operation may be started on this section by May 15. On the Albion-Lockport section poles are now being erected and the tracklaying has

been completed from Middleport to Lockport. Edmund Wragge, chief engineer, Toronto, Ont. (Noted March 14.)

Chambersburg Greencastle & Waynesboro Street Railway, Waynesboro, Pa.—It is reported that this company expects to operate cars from Waynesboro to Chambersburg, Pa., by May 30. The line between Greencastle and Marion has been completed and construction is now in progress near Chambersburg and Guilford Springs. (Noted April 4.)

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—Judge Tarrant has ordered the Fidelity Trust Company to issue $1,000,000 of 6 per cent receiver's certificates as required, to be used in completing the line into Milwaukee. About eight miles of track remains to be completed. The Columbia Construction Company of Milwaukee has been awarded the contract and has agreed to accept the certificates in payment. Clement C. Smith, president of the construction company, announces that the line will be completed about July 15.

Connecticut Company, New Haven, Conn.—This company has applied to the Massachusetts railroad commission for approval of the route and method of construction of the proposed line from Hartford to Middletown, Conn.

Dallas Interurban Electric Railway, Dallas, Tex.—This company, which proposes to build a system of electric railways in Dallas, Oak Cliff, West Dallas and Cement City, Tex., about 20 miles, and an interurban line from Dallas to Terrell, 30 miles, is about to issue $1,500,000 of first mortgage 5 per cent 20-year bonds based on its franchises, right of way and terminal property. Henry Dorsey, president. (Noted February 22.)

Denver & Interurban Railway, Denver, Colo.—It is reported that plans are being made for beginning operation about May 15 between Denver and Boulder, Colo. H. W. Cowan, chief engineer. (Noted March 21.)

Des Moines & Sioux City Railway, Lake City, Ia.—It is stated that surveys will be started at once for the proposed line from Des Moines to Lake City, Ia. via Sac City and Storm Lake, under the direction of J. G. Killey of Geneva, Ill. S. N. Elwood of Sac City is president. (Noted February 22.)

Donora & Eldora Street Railway, Monongahela, Pa.—It is stated that this company has received bids for the construction of its line from Donora to Eldora, 3.3 miles, and that work is to begin at once. The line will include a 350-foot viaduct. B. M. Hanna, 718 Penn avenue, Pittsburg, is president. (Noted November 30, 1907.)

Edmonton (Alberta) Street Railway.—Tracklaying has been completed on the municipal street railway line, consisting of about 6½ miles of double track. It is probable that a franchise will be granted for its operation.

Elmira Corning & Waverly Railroad, Waverly, N. Y.—It is reported that construction will be resumed this summer on the line between Elmira and Ashland, N. Y., a portion of the proposed Corning-Elmira line. G. T. Rogers of Binghamton, N. Y., is president.

Ft. Smith (Ark.) Light & Traction Company.—Construction has been started on an extension to a new suburb on the south side of Ft. Smith.

Ft. Wayne & Springfield Railway, Decatur, Ind.—Elections will be held on May 14 in Berne, Monroe, Decatur and Washington, Ind., for the purpose of voting on subsidies amounting to $85,000 to aid in the construction of the extension from Decatur to Berne. (Noted March 14.)

Fundy Park Amusement Company, St. John, N. B.—This company proposes to build an amusement park at Westfield, a suburb of St. John, N. B., and to build an electric street railway from St. John to the park, 3.5 miles. Construction is to begin about June 1. Charles Diggs, 132 West Seventy-eighth street, New York, is secretary.

Hudson & Long Island Traction Company, New York, N. Y.—Arthur C. Hume, secretary, writes that this company proposes to build an electric railway from Long Island City across the Blackwell's Island bridge to the West Forty-second street ferry, Manhattan, 4½ miles, via Fifty-seventh street, Eleventh avenue and Forty-third street. The officers are: President, F. K. Morris; vice-president, C. M. Wicker; treasurer, Anthony Stumpf; chief engineer, W. B. Spencer, all with offices in the Times building, New York City. (Noted April 11.)

Indianapolis Crawfordsville & Western Traction Company, Indianapolis, Ind.—Officers and directors of this company are to make have made an automobile inspection trip this week [illegible] proposed routes for extensions west of Crawfordsville to the [illegible] terminus of the line. One route parallels the Cleveland Cincinnati Chicago & St. Louis Railway to Danville, Ill., and the other extends to Attica, Ind.

Kansas City & Olathe Electric Railroad, Kansas City, Mo.—F. P. Dickson, president, writes that grading has been completed on the proposed 2-mile extension of this line from Merriam to Shawnee, Kan., and the overhead construction, which is of the bracket type, from Merriam to Hockers Grove, where a pleasure park is to be operated. Work on the remainder of the distance, 1½ miles, is being pushed. A power house equipped with two 150-horsepower gas engines and two 100-kilowatt generators has been completed at Merriam and furnishes power for that portion of the line from Rosedale to Merriam, which was placed in operation on October 10, 1907. A connection is made at Rosedale with the Metropolitan Street Railway of Kansas City, Mo. A. M. Myers, chief engineer, Merriam, Kan. (Noted April 25.)

Kansas City (Mo.) Railway & Light Company.—Construction was started last week on a 2-mile extension in Argentine, Kan.

Kansas City Springfield & Southern Railway, Nevada, Mo.—It is reported that grading has been started on the proposed line from Nevada to Springfield, Mo., 90 miles. The right of way was obtained and surveys were made last year. W. B. Forsyth, president; C. C. McFann, general manager. (Noted January 11.)

Kansas Traction Company, Coffeyville, Kan.—Surveys are being made in the vicinity of Lawrence, Kan., on the proposed line which is to connect Coffeyville and Lawrence with branches to Topeka and Kansas City. F. B. Shirley, president; Paul Julian, engineer. (Noted April 11.)

Lake Erie Bowling Green & Napoleon Railway, Bowling Green, O.—It is reported that this company is making financial arrangements for extending the line from Bowling Green to Tontogany, O. E. H. McKnight, vice-president and general manager. (Noted January 4.)

Lake View Traction Company, Memphis, Tenn.—R. F. Tate, president, writes that surveys have been completed from Memphis west to Clarksdale, Miss., and north to Covington, Tenn., 105 miles. The entire length of the line will be 148 miles, 65 of which will be in Mississippi and 83 in Tennessee. The road also will be built east from Memphis to Collierville, Tenn. Mr. Tate states that construction work will be started soon. (Noted February 29.)

Lima-Honeoye Electric Light & Railroad Company, Lima, N. Y.—E. D. Watkins, manager, writes that it is proposed to begin construction at an early date on extensions of the Lima-Honeoye line to Rochester on the north and to Atlanta or Wayland on the south. (Noted March 7.)

Little Rock & Hot Springs Electric Railway, Little Rock, Ark.—It is reported that construction work will be started within 90 days on the proposed line between Little Rock and Hot Springs, Ark., which it is estimated will serve a total population of about 250,000. The company plans to erect its own power station. As yet no contracts have been awarded. The officers are as follows: President, C. J. Kramer; vice-president, L. Garrett; secretary, J. C. Marshall; superintendent, J. F. Russ; electrical engineer, P. M. Pierce.

Los Angeles & Port Orient Railway, Los Angeles, Cal.—William H. Carlson, president, writes that this company proposes to build an electric railway from Hermosa Beach to Culler Station, Cal., seven miles, connecting with the Los Angeles Pacific Railway and the Los Angeles & Redondo Railway and forming a through route between Los Angeles and Redondo. J. H. Mather, chief engineer.

Mankato (Minn.) Electric Traction Company.—This company has recently completed a 5-mile street railway line in Mankato and regular operation is expected to begin within a few days. The Knox Engineering Company of Chicago had the contract for building the line. H. E. Hance, superintendent.

Minneapolis St. Paul Rochester & Dubuque Traction Company, Minneapolis, Minn.—We are officially advised that a contract has been let to H. A. Whittier of Northfield, Minn., for the grading between Savage and Northfield, Minn., on the proposed line from Minneapolis, Minn., to Dubuque, Ia. F. G. L. Hunt, chief engineer. (Noted April 18.)

Maryland Electric Railways, Baltimore, Md.—Rapid progress is being made on the electrification of the old Baltimore & Annapolis Short Line Railroad between Baltimore and Annapolis, Md., and it is stated that operation between Annapolis and Glenburnie will begin within a week. Between Cliffords and Camden a leased track of the Baltimore & Ohio Railroad will be used and the electrified line will reduce the

distance between the two cities to 26 miles. Power will be obtained from the plant of the Consolidated Gas Electric & Power Company at Westport, Md. J. G. White & Co. have the contract for the electrification work. J. Wilson Brown, president. (Noted September 21, 1907.)

Mt. Hood Railway & Power Company, Portland, Ore.—C. W. Miller, secretary and general manager, writes that this company proposes to build an electric line from Portland to Bull Run, Ore., 25 miles. Surveys have been made for a line from Portland to the Deschutes river, 150 miles. Grading has been completed and the overhead catenary construction is being erected from Gresham to Bull Run, 16 miles. The power house at Bull Run will be equipped with two 3,000-kilowatt generators. All contracts have been let. The Westinghouse Electric & Manufacturing Company has the contract for the electrical equipment, Pierson, Roeding & Co. for the overhead equipment and the Mason Construction Company for the construction work. E. P. Clark of Los Angeles is president; F. C. Finkle, Los Angeles, chief engineer. (Noted April 11.)

Murphysboro (Ill.) Street Railway Light Heat & Power Company.—John G. Hardy, secretary, writes that this company proposes to build a 3-mile extension in the city of Murphysboro the latter part of this year. The company now operates one mile of track and two cars.

Newark Martinsburg & Mt. Vernon Electric Railway, Newark, O.—It is reported that financial arrangements have been made for the construction of this proposed road from Newark to Mt. Vernon and Wooster, O., and that work will begin at an early date. Dr. J. F. Schronty is president.

Northwestern Ohio Electric Railway, Defiance, O.—This company, which proposes to build an electric railway from Defiance to Montpelier, O., 34 miles, via Bryan and Evansport, has filed a mortgage for $1,000,000 in favor of the Security Savings Bank & Trust Company of Toledo to secure an issue of a like amount of 5 per cent bonds. G. G. Bloom, president, Stryker, O.; John Crowe, secretary, Defiance, O. (Noted May 4, 1907.)

Oakland (Cal.) Traction Company.—The Oakland board of works has ordered this company to widen the space between its tracks on Broadway from Water street to Fourteenth street. The line was formerly operated by cable and the tracks are embedded in cement.

Prairie State Traction Company, Whitehall, Ill.—It is reported that this company, which was incorporated last year to build an electric railway from Whitehall to Pana, Ill., has made arrangements for securing financial backing provided the right of way is obtained. (Noted March 23, 1907.)

Pleasantville (Pa.) Traction Company.—It is reported that capitalists of Oil City, Titusville and Pleasantville, Pa., have organized this company to build an electric railway connecting the cities named, a distance of about 12 miles.

Public Service Railway, Newark, N. J.—President Thomas N. McCarter has informed the Montclair board of trade that the company does not propose to build the proposed line from Montclair to Paterson, N. J., this year because of financial conditions.

Puget Sound Electric Railway, Tacoma, Wash.—Work has been started at the Puyallup end of the extension from Tacoma to Puyallup, Wash. W. S. Dimmock, manager. (Noted April 4.)

Redlands & Yucaipe Electric Railroad, Redlands, Cal.—This company has issued $500,000 30-year 5 per cent bonds for the construction of its proposed line from Redlands to Oak Glen, Cal., 20 miles. O. D. Collins is chief engineer.

Rochester Corning & Elmira Traction Company, Rochester, N. Y.—Surveys are being made on the line from Hornell to Dansville, N. Y., a branch of the proposed line from Rochester to Elmira, N. Y. (Noted April 11.)

St. Louis Montesano & Southern Railway, St. Louis, Mo.—We are officially advised that grading and overhead work is in progress from St. Louis to Kimswick, Mo., 20 miles, on the proposed line from St. Louis to Flat River, 60 miles. Tracklaying has been completed for 1½ miles out of St. Louis. The construction work is being done by the company. A power house and substations for the first division are now under construction. The power house equipment will include compound Corliss engines, 400-kilowatt generator and two Heine boilers. Charles A. Gutke, president; John A. Laird, chief engineer. (Noted February 29.)

St. Tammany & New Orleans Railway & Ferry Company.—It is reported that 13 miles of grading have been completed on the line from Mandeville to Covington, La., and that tracklaying will begin at an early date. Clay Riggs of Covington is president. (Noted March 21.)

Salt Lake & Ogden Railway, Salt Lake City, Utah.—Simon Bamberger, president, has announced that the electrified line from Salt Lake City to Ogden, Utah, will be ready for operation by May 30. (Noted March 28.)

Sioux City, Ia.—Dr. L. A. Westcott and Robert Gracey of Cherokee, Ia., are seeking to interest the Sioux City Commercial Club in a project to build an electric railway from Sioux City to Spirit Lake, Ia.

Windsor Essex & Lake Shore Rapid Railway, Windsor, Ont.—The extension from Kingsville to Leamington, Ont., 10 miles, has been completed and was opened for traffic on April 22. (Noted March 28.)

Yakima Valley Transportation Company, Yakima, Wash.—Construction has been started on a 3-mile extension in North Yakima, Wash. A. J. Splawn, president. (Noted January 4.)

York (Pa.) Railways Company.—David Young, Jr., general manager, writes that this company is not contemplating at the present time any extensions except a short extension of the city lines in York.

POWER HOUSES AND SUBSTATIONS.

Bear Lake Electric Light & Power Company.—It is stated that this company will erect a new power house and make other improvements for the distribution of current for lighting purposes and the operation of an electric railway from Montpelier to the lake. C. R. Slusser, Montpelier, Idaho, is secretary.

City & Elm Grove Railroad, Wheeling, W. Va.—This company intends doubling the capacity of its power house at Elm Grove by installing steam turbines which will utilize the exhaust from the four high-pressure engines at present generating steam power for the electric machinery. These improvements will cost about $35,000. J. W. Smith, general manager, Wheeling, W. Va.

Columbia Electric Street Railway Light & Power Company, Columbia, S. C.—This company will install a 1,000-kilowatt generator and other electrical machinery in its water power plant. E. W. Robertson, president, Columbia.

Crookston, Minn.—Elias Steenerson, postmaster of Crookston, Minn., and Knute Aaker of Hubbard are interested in the construction of a proposed dam across the Red river near Hubbard and a power plant which will furnish power for the operation of an electric railway between Fargo and Grand Forks, N. D., and Crookston, Minn. The Amburgen Hydraulic Company, 176 Federal street, Boston, Mass., has prepared plans and estimates. (Noted April 18.)

Fairmont & Clarksburg Traction Company, Fairmont, W. Va.—It is announced that this company intends to build a power plant at Clarksburg, W. Va. S. L. Watson, president, Fairmont, W. Va.

Goose Creek Railway & Power Manufacturing Company, Jesup, Ga.—D. G. Zeigler & Co., Atlanta, Ga., state that as soon as the plans have been completed contracts for the construction and equipment of this proposed plant will be let. Power will be furnished for the operation of an electric railroad, cotton mills and other commercial enterprises. The plant will cost about $500,000.

Hagerman, Idaho.—It is announced that the Twin Falls Company is preparing to begin work on the construction of a power plant on the Snake river at Lower Salmon Falls, which will furnish power for the operation of projected electric lines in that section.

North Coast Power Company.—Work has been started on the construction of a dam across the Clearwater river about four miles north of Lewiston, Idaho. A hydro-electric plant here will generate power for the operation of the proposed interurban railway from Lewiston up the Snake river valley and across into Washington, serving Asotin, Cloverland and other points in that section, with a terminal at Pomeroy, Wash. It is stated that the power plant will be built for 50,000-horsepower ultimate capacity.

Northern Power Company, Hibbing, Minn.—Ground is being broken by this company for the construction of a power plant to be located about six miles north of Chisholm, Minn. When completed the plant will furnish power for the operation of the proposed lines of the Northern Traction Company, which will build an electric railway between Hibbing and Chisholm and operate local lines in the two towns. The company also will furnish power for lighting purposes in Chisholm.

Personal Mention

Mr. William Long, for the past two years master mechanic of the Saginaw-Bay City Railway & Light Company at Saginaw, Mich., has resigned.

Mr. Fred W. Smith of Chicago has been elected a director of the Metropolitan West Side Elevated Railway Company of Chicago, succeeding Mr. Byron L. Smith, resigned.

Mr. J. MacWolff, heretofore superintendent of the Chambersburg Greencastle & Waynesboro Street Railway at Waynesboro, Pa., has resigned, effective on April 15.

Mr. Frederick G. Bourne was elected a director of the Long Island Railroad Company at a meeting of stockholders held last week in Long Island City, succeeding Franklin B. Lord, deceased.

Mr. Robert McArthur, heretofore chief engineer of the New Haven power stations of the Connecticut Company, has been transferred to Stamford, Conn. He will be succeeded at New Haven by Mr. J. F. Kirby, heretofore assistant engineer.

Mr. James R. League, formerly assistant secretary and treasurer of the Augusta Railway & Electric Company, Augusta, Ga., has been appointed general manager of the company, effective on May 1, succeeding Mr. E. P. Wetmore, resigned, as announced in an earlier issue.

Mr. T. C. Roberts, master mechanic of the Pueblo (Colo.) plant of the American Smelting & Refining Company, has been appointed superintendent of power and shops for the Pueblo & Suburban Traction & Lighting Company, with headquarters at Pueblo.

Mr. L. D. Mathes, whose portrait is presented herewith, was re-elected secretary and treasurer of the Iowa Street and Interurban Railway Association at its fifth annual meeting held at Des Moines, Ia., on April 23 and 24, 1908. Mr. Mathes is about 36 years of age and was born in the south. He is a graduate of the University of Tennessee and before entering street railway work was for a time employed in the shops of the Memphis & Charleston Railroad at Memphis, Tenn. He then became connected with the Edison General Electric Company (now the General Electric Company) and later with the Westinghouse Electric & Manufacturing Company, during which time he was engaged in the construction and equipment of electric railways in various sections of the country. After five years' experience in this line of work he resigned to become general foreman of the Buffalo & Niagara Falls Electric Railway, where he remained until appointed superintendent of the Norfolk & Ocean View Railway at Norfolk, Va., then in the hands of a receiver. While with this company and under his direction a successful freight business was developed and at the end of his $2\frac{1}{2}$ years' service the road was restored to the original owners on a paying basis. He subsequently was appointed general superintendent of the Charleston (S. C.) & Seashore Railway, resigning at the end of a year to accept a similar position with the Norfolk & Atlantic Terminal Company. He later went west to become general manager of the Union Electric Company at Dubuque, Ia., which position he now holds. Mr. Mathes has been secretary and treasurer of the Iowa Street and Interurban Railway Association since that body was organized five years ago.

L. D. Mathes.

Mr. J. L. Millspaugh, heretofore in charge of the transportation department of the Detroit Jackson & Chicago Railway (formerly the Detroit Ypsilanti Ann Arbor & Jackson Railway), has been appointed general superintendent of the western division of the Michigan United Railways, with jurisdiction over the interurban lines between Jackson, Battle Creek and Kalamazoo and the Kalamazoo and Battle Creek city lines. Mr. Millspaugh had been connected with the Detroit-Ypsilanti lines since 1898, serving for five years in the mechanical and electrical departments. During the last five years he was in charge of the transportation department of the company.

Mr. Willis Holden has been elected to succeed the late Albert R. Hiscock as treasurer of the Auburn & Syracuse Electric Railroad, Rochester Syracuse & Eastern Railroad, Syracuse Lake Shore & Northern Railroad and the Syracuse & South Bay Electric Railroad. Mr. Fidelio K. Hiscock, a brother of Albert K. Hiscock, has been elected a director of the companies.

Mr. R. W. Harris, whose portrait is presented herewith, was appointed general manager of the Joplin & Pittsburg Railway at Pittsburg, Kan., effective on April 4, as announced in the Electric Railway Review of April 18. Mr. Harris was born in Gordonsville, Va., on August 24, 1866, and was educated in the public schools of that town. After a four years' engineering course at a private school conducted by Prof. Fountain B. Davis, a well-known educator of Virginia, he entered the engineering department of the Chesapeake & Ohio Railroad, where he remained as assistant construction engineer for about three years. He then became associated with the Flat Top and Trans-Flat Top Coal Land Association of West Virginia, controlled by the E. W. Clark interests, resigning in 1896 to enter street railway work with the Richmond Traction Company at Richmond, Va., first as night dispatcher, then day dispatcher, chief dispatcher, assistant superintendent and superintendent of the Richmond lines. In July, 1902, when control of this company passed into the hands of Frank J. Gould and others, Mr. Harris was transferred to the Norfolk Railway & Light Company as assistant superintendent and later as superintendent at Norfolk under Mr. E. C. Hathaway, general manager. In December, 1904, he resigned to become superintendent of the Michigan Traction Company at Kalamazoo, Mich., and in December, 1905, when the property was merged with others into the Michigan United Railways, he went to Streator, Ill., as general manager of the Illinois Light & Traction Company, where he remained for two years. In December, 1907, he resigned to become general superintendent of the Joplin & Pittsburg Railway at Pittsburg, Kan., and now succeeds Mr. P. P. Crafts as general manager, who resigned on March 31, as announced last week.

R. W. Harris.

Mr. William E. Price, heretofore in charge of the electrical department of the Pueblo & Suburban Traction & Lighting Company, Pueblo, Colo., has been relieved of these duties and will henceforth act as consulting electrical engineer of the company, with headquarters at Pueblo. The work of remodeling the Pueblo plant of the company, which is about completed, has been under the supervision of Mr. Price.

Mr. L. R. McBroon has been appointed general superintendent of the Rutland Railway Light & Power Company at Rutland, Vt., with charge of the operating and street railway departments, combining the duties heretofore discharged by Mr. Henry W. Brow, electrical engineer, and Mr. Walter H. Horton, general manager, resigned. Mr. McBroon formerly was with the General Electric Company.

OBITUARY.

Samuel Haigh, formerly superintendent of the Westchester Traction Company, Ossining, N. Y., died last week of pneumonia at his home in Kings county, New York. Mr. Haigh was the first superintendent of the Delaware County & Philadelphia Electric Railway, Clifton Heights, Pa., having held that position from the time the road was placed in operation in the early nineties, until 1902. He was also at one time secretary of the Citizens Electric Light & Power Company of Chester, Pa.

Financial News

Birmingham & Gulf Railway & Navigation Company, Birmingham, Ala.—This company has purchased the belt line at Tuscaloosa, Ala., formerly owned by the Tuscaloosa Belt Railway. The company has given a trust deed to the Carnegie Trust Company of New York as trustee to secure an issue of $10,000,000 of 5 per cent bonds dated October 1, 1907, and due on October 1, 1957, but subject to call on and after April 1, 1912, at 108 and interest. The company plans to build an electric railway between Tuscaloosa, Birmingham and Gadsden.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—The outstanding first and refunding mortgage bonds have been increased from $4,755,000 to $5,005,000 for the purpose of providing funds for the construction of an extension five miles in length in Mill Creek township, Pennsylvania.

California Gas & Electric Corporation, San Francisco, Cal.—A plan has been promulgated providing for the transfer of the properties of the subsidiary corporations, except railways, to this company and the creation of an authorized issue of $45,000,000 of unifying and refunding mortgage 5 per cent bonds, as follows: To retire outstanding bonded debt after deducting bonds retired by sinking funds, $30,282,000; to be issued at 90 for refunding existing obligations of the corporation incurred for new construction and improvements, $3,055,000; to be sold at not less than 90 to provide for 85 per cent of the actual cost of future extensions and new property acquired, $11,663,000. A syndicate has agreed to purchase the $3,055,000 aforesaid bonds.

Calumet & South Chicago Railway, Chicago, Ill.—This company, which was recently incorporated to consolidate the South Chicago City Railway and the Calumet Electric Street Railway, has increased its capital stock from $1,000 to $5,000,000. The property and assets of the Calumet company were taken over on February 24 by permission of the federal court and the receivership will be vacated as soon as certain legal obstacles are removed.

Ft. Dodge Des Moines & Southern Railroad, Ft. Dodge, Ia.—L. E. Armstrong of Ft. Dodge has been elected a director.

Ft. William, Ont.—The city council is negotiating with the Port Arthur Street Railway for the purchase of that portion of its line which lies within the limits of Ft. William.

Havana (Cuba) Electric Railway.—Gross earnings of the railroad in 1907 were $1,810,888 as compared with $1,579,302 in 1906. Including the revenue of stage lines gross earnings were $2,143,122 as compared with $1,919,103. Operating expenses, taxes and rentals were $1,232,735 as compared with $1,254,669. After the payment of preferred dividends aggregating 5½ per cent, there was a surplus of $91,075 in 1907 as compared with a deficit of $31,932 after paying preferred dividends of 4 per cent in 1906. Warren Bicknell, the president, says in the annual report that the track-mile earnings during the year were in excess of $36,000, indicating that the maximum earnings upon the present track mileage are being approximated and that additional mileage will be required soon to handle the increased traffic.—The New York stock exchange has listed $1,115,000 additional consolidated mortgage 5 per cent bonds, making the total listed $7,908,000.

Honolulu Rapid Transit & Land Company, Honolulu, T. H.—Gross earnings in 1907 were $367,134 as compared with $349,916 in 1906. Operating expenses were $201,228 as compared with $202,148. Total net income was $173,381 as compared with $153,499. A deduction of $22,807 was made for depreciation as compared with a similar provision in 1906 of $31,041. L. T. Peck, the president, states in the annual report: "As about one-third of the franchise period has passed by it is proper to remind you of the increasing importance of establishing a sinking fund for retiring, at least in part, the capital investment at the expiration of your franchise."

Interborough Rapid Transit Company, New York, N. Y.—The New York public service commission of the first district has authorized a bond issue of $55,000,000, secured by mortgages on the company's entire property. At present only $30,000,000 of the bonds will be issued. These will bear interest at 5 per cent, payable semi-annually, and will mature November 1, 1952. The $30,000,000 of bonds will be issued as collateral security for an issue of $25,000,000 3-year 6 per cent notes, which may be exchanged after 2½ years for the bonds at 99. It is officially announced that J. P. Morgan & Co. have agreed to underwrite the notes at 97 and accrued interest from November 1, 1907. The commission points out that the new issue does not increase the company's indebtedness, as it will be used to retire outstanding obligations which mature soon, including the indebtedness incurred in connection with the Brooklyn extension of the subway.—The Continental Securities Company has filed a complaint in the United States circuit court against the Interborough Rapid Transit Company, the Interborough-Metropolitan Company, the Metropolitan Street Railway and the Windsor Trust Company asking for the appointment of a receiver for the Interborough Rapid Transit Company. The complaint alleges that the Interborough-Metropolitan Company is a monopoly, and that the stocks of the various component companies were acquired illegally. The complainant asks that all transactions in regard to the acquisition of stocks be declared invalid and that the stock of the Interborough Rapid Transit Company be re-exchanged and surrendered to the holders of the Interborough-Metropolitan 4½ per cent collateral trust bonds issued by the Windsor Trust Company to the amount of $67,825,000.

London Underground Electric Railways.—Details of the plans for the readjustment of the finances of this company, which has been placed in the hands of Sir George Gibb as receiver, were made public last week. All the cash requirements are to be met through the sale to Speyer & Co. of $5,000,000 12-year 5 per cent prior lien bonds, the bankers agreeing to provide up to $1,500,000 additional cash for any possible deficiency in fixed charges during the further development of the enterprise. The plan provides that against the pledge of a total of $72,500,000 face value of securities the company will issue $5,000,000 prior lien 5 per cent bonds, the issue which Speyer & Co. are to purchase, $15,000,000 4½ per cent bonds due 1933 and $26,000,000 6 per cent income bonds due 1948. The present noteholders are to receive 40 per cent in 4½ per cent bonds and 70 per cent in 6 per cent income bonds, giving them $1,100 in bonds for each $1,000 note. In case the earnings of the properties develop sufficiently to enable the company to pay the full interest on the income bonds, the noteholders will get more than 5 per cent interest per annum, the rate which the notes carry now. The noteholders will, by accepting the income bonds, also have the controlling voice in the management, as the income bonds will be entitled to vote.

Oregon Electric Railway, Portland, Ore.—This company, which recently completed its line from Portland to Salem, Ore., has filed amended articles of incorporation providing for an increase of capital stock from $2,500,000 to $10,000,000 for the purpose of building additional lines.

Pittsburg & Allegheny Valley Railway, Leechburg, Pa.—Samuel J. Graham, Walter J. Guthrie and George M. Hosack have prepared a plan of reorganization as follows: "The new company shall have an authorized issue of $250,000 of 30-year 5 per cent mortgage bonds, which are to be sold (with a bonus of 25 per cent of common stock) at not less than 85 per cent; authorized issues of $450,000 of 6 per cent cumulative preferred stock and $250,000 common stock. All bona fide holders of bonds and all persons who have actually paid in cash therefor may participate in the reorganization, the agreements to be signed and deposited with the bonds with the Safe Deposit & Trust Company of Pittsburg. The plan stipulates for a delivery by a large holder of bonds and a release of all his right and title in $300,000 bonds and the delivery of the stock which he holds as collateral. For each $1,000 bond the holder is to receive $1,000 in preferred stock and $400 in common stock, full paid.

United Railways Investment Company, New York.—The issue of $3,500,000 of 6 per cent serial notes of 1908 has been sold. The company will acquire with the proceeds $3,500,000 of first preferred 7 per cent stock of the United Railroads of San Francisco. The latter company reports gross earnings in March of $558,524 as compared with $537,700 in March, 1907.

Washington Traction Company, South Charleston, O.—The property of this company, whose line from Springfield to Charleston, O., 14 miles, has been operated by a receiver, S. B. Rankin, will be sold under foreclosure at the courthouse in Springfield on May 11. George Baker of Washington Court House, O., one of the largest creditors, has been buying bonds and claims against the road and it is understood that he will buy the road and extend it to Washington Court House.

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia.—This company has negotiated a loan of $2,000,000 from Louis Boisot and the First Trust and Savings Bank of Chicago for the purpose of extending its lines. The loan is for a term of 40 years, with interest at 5 per cent, and is secured by a trust deed.

West Penn Railways, Pittsburg, Pa.—Net earnings for the year ending March 31, 1908, were $775,839, an increase over the previous year of $132,946. The surplus was $346,622.

Manufactures and Supplies

ROLLING STOCK.

Pittsburg & Butler Street Railway, Pittsburg, Pa., has ordered two interurban cars from the Cincinnati Car Company.

Portland Railway Light & Power Company, Portland, Ore., has placed an order with The J. G. Brill Company for 25 double-truck cars.

Connecticut Valley Street Railway, Greenfield, Mass., has placed an order with the Wason Manufacturing Company for five double-truck cars.

Auburn & Northern Electric Railroad, Auburn, N. Y., has placed an order with the G. C. Kuhlman Car Company for one large double-truck car.

Washington Railway & Electric Company, Washington, D. C., which has been reported in the market for 15 large double-truck cars, expected to place the order this week.

Walla Walla Valley Traction Company has placed an order with the Westinghouse Companies for two equipments for large cars, which are now being built by the American Car Company.

Nanki Railway of Japan has placed an order through Takata & Co., New York, for 12 double-truck equipments, including motors, trucks and air brakes. The order was secured by the Westinghouse interests.

Choctaw Railway & Lighting Company, McAlester, Okla., which was reported in the Electric Railway Review of April 18 to be in the market for two cars, has placed an order with the Niles Car & Manufacturing Company for two interurban trailers.

Philadelphia Rapid Transit Company, Philadelphia, Pa., is reported to be considering the adoption of the pay-as-you-enter type car. Estimates on the cost of converting 50 of the old cars have been asked and it is thought that the board of directors will authorize the expenditure.

SHOPS AND BUILDINGS.

Nelson (B. C.) Electric Tramway.—The car houses of this company were destroyed by fire on April 27.

TRADE NOTES.

Curtain Supply Company, Chicago, has moved its New York office to the Hudson Terminals.

American Bridge Company has moved its New York offices from 42 Broadway to the Hudson Terminals, 30 Church street.

American Steel Foundries has moved its New York offices from 42 Broadway to the Hudson Terminals, 30 Church street.

Union Spring & Manufacturing Company, Pittsburg, Pa., has moved its New York office to the Hudson Terminals, 50 Church street.

Wendell & MacDuffie, New York, have removed their offices from 26 Cortlandt street to the Hudson Terminals, Fulton building.

Sherwin-Williams Company, Cleveland, O., has moved its New York office from 66 Broadway to the Hudson Terminals, 50 Church street.

Cassier Magazine Company announces the removal of its New York offices from 3 West Twenty-ninth street to 12 West Thirty-first street.

Railway Steel-Spring Company, New York, has removed its general offices from 71 Broadway to the Hudson Terminals, Cortlandt building.

Pressed Steel Car Company, Pittsburg, has declared the regular quarterly dividend of 1¾ per cent on its preferred stock, payable May 27.

Eugene Munsell, president of the Mica Insulator Company, New York, is dead. Mr. Munsell was 56 years old and had been in ill health for a long time.

Henry F. Gillespie, who has been assistant superintendent of the Standard Paint Company's works at Round Brook, N. J., since 1893, has been appointed superintendent.

Walter H. Baldwin, for the past 11 years Chicago sales manager of the Lidgerwood Manufacturing Company, New York, has resigned and is now associated with the Adams & Westlake Company, Chicago, as assistant general manager. The latter company has moved its New York offices to the Hudson Terminals, Cortlandt building.

American Brake Shoe & Foundry Company, Mahwah, N. J., has moved its New York offices from 170 Broadway to the Hudson Terminals, Cortlandt building.

The Wilson Company, 160 Harrison street, Chicago, publisher of The Railway Age and Electric Railway Review, has moved its New York offices from 150 Nassau street to the Hudson Terminals, Fulton building.

Ohio Brass Company, Mansfield, O., on May 8 will remove its New York offices from 43 Exchange place to 1022 Hudson Terminals, Cortlandt building. On May 1 the Chicago offices of the company were moved from 321 Dearborn street to 508 Fisher building.

Westinghouse Electric & Manufacturing Company's merchandise creditors' plan, which was outlined in the Electric Railway Review for April 11, has been approved by representatives of claims aggregating $3,500,000 out of a total of $4,250,000 of merchandise debt.

Pantasote Company, 11 Broadway, New York, has had its Pantasote curtain material and Agosote headlining specified for the 25 cars to be built by The J. G. Brill Company for the Portland Railway Light & Power Company, as reported elsewhere in this issue of the Electric Railway Review.

Griffin Double Tread Car Wheel Company, Buffalo, N. Y., has been incorporated with a capital stock of $200,000 to manufacture a car wheel patented by P. H. Griffin, who recently resigned as general manager of the New York Car Wheel Company, as reported in The Railway Age for April 24. Mr. Griffin is not an officer or director of the new company, but his two sons, H. F. Griffin and W. A. Griffin, will be president and secretary, respectively.

Robert W. Hunt & Co., Chicago, have established an analytical chemical laboratory in connection with their St. Louis office, 1445 Syndicate Trust building. In addition to general analytical work particular attention will be given to analyses of and advice on iron foundry mixtures. This work and the laboratory will be under the direction of J. B. Emerson, who for several years past had charge of the metallurgical part of the wheel foundry of the Mt. Vernon Car Company. Previous to that Mr. Emerson was in the employ of the Illinois Steel Company.

Charles A. Maher, who for many years has been in the business of manufacturing and marketing car wheels, and who is now, and has been since its formation, vice-president of the National Car Wheel Company, Pittsburg, has associated himself with Otis, Bonnell & Co., Cleveland, as sales manager of the car wheel department, and will handle exclusively the cast-iron and steel-tired street and steam railway wheels manufactured by the National Car Wheel Company, as heretofore, with offices 408-410 Cuyahoga building, Cleveland, O. J. E. Rawson will continue as sales manager of the steel department, and William F. Bonnell will devote his time largely to the interests of the Securities Corporation, Limited, of 40 Wall street, New York, and the Guanajuato Development Company, operator of mines, mills and railroads in the city and state of Guanajuato, Mexico.

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

Portland Rose Festival Association, Portland, Ore.—A handsomely engraved folder invites attendance at the Portland rose festival to be held June 1 to 6, 1908.

Purdue University, Lafayette, Ind.—The annual catalogue for 1907-08, a book of 320 pages, 5 by 7 inches, is published as Vol. VIII, No. 4, of the University Bulletin.

Goldschmidt Thermit Company, 90 West Street, New York, N. Y.—A 12-page illustrated leaflet treats the subject of butt welding wrought iron and steel and pipes and rods by the thermit process.

Hyatt Roller Bearing Company, Newark, N. J.—A recently issued catalogue devoted to Hyatt roller bearings contains information regarding more than 300 sizes that have been standardized and are now carried in stock. Each bearing has a capacity rating which enables the engineer to determine the most efficient size.

J. G. White & Co., New York, N. Y.—"At Work Around the World" is the title of an artistic book illustrating and describing some of the more important work done on five continents by this company and affiliated companies. The book is unusually interesting from cover to cover and contains many fine illustrations.

NEW DESIGN FOR PAY-AS-YOU-ENTER CARS.

The Jewett Car Company has designed and is now putting on the market a new type of pay-as-you-enter car. A full-size model of this car has been on exhibition in New York, and the new features brought out in this design have met with very favorable comment.

The Jewett design provides for wide folding doors on opposite corners of each platform. These doors are closed on the front platform and open at the rear end, this opening being used for exit and entrance ways for passengers. There are small sliding doors at the opposite sides of the platforms, the door at the rear end being closed and locked. The forward sliding door may be used for the exit of passengers.

The particularly interesting feature of the Jewett design consists in the novel arrangement of the folding partitions, which are hinged about an upright pipe placed on the car platform. These partitions are identical at either end of the car and on the front platform are swung into a V-shaped position, forming an inclosed cab for the motorman. On the rear platform one of these partitions is locked at right angles to the center line of the car. The partition carries within itself a swinging door which forms the entrance way for passengers. The other partition on the rear platform swings against the bulkhead, thus closing the rear end of the car completely. This partition is swung to a position at right angles to the center line of the car, and in this position forms the exit at the rear end.

Pay-As-You-Enter Car—Platform Arrangement for Double-End Operation.

In connection with this car the Jewett company has developed a very interesting type of automatic folding turnstile, which is placed on the partition at the jam of the swinging entrance door. This turnstile is connected to the car register, and positively registers each passenger entering through the entrance door. The turnstile is automatically folded by the movement of the partition, to which it is fastened when this partition is moved to form the motorman's cab. The movement of the swinging partition also automatically folds up the steps at the doors which are not in use on the blind side of the car.

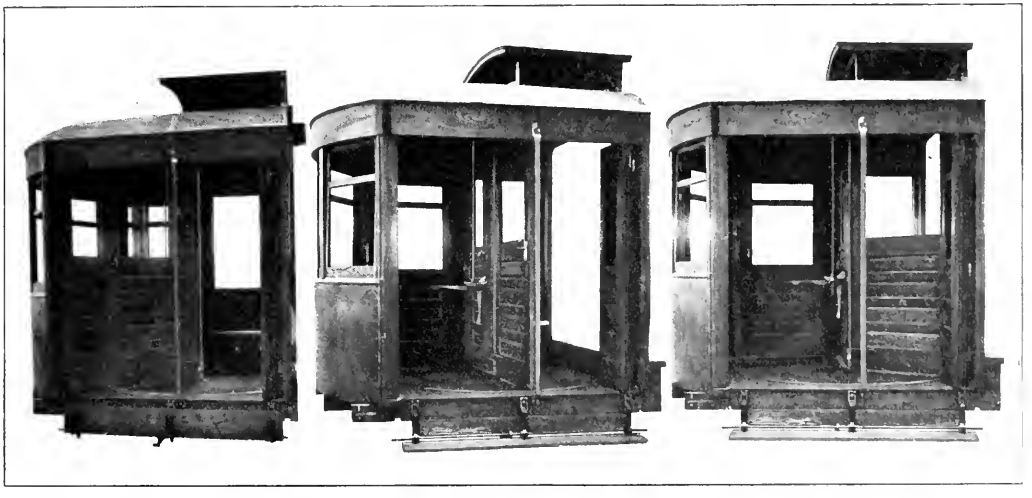
The valuable feature of the design which appeals most to railway managers is the fact that the maximum seating capacity is obtained inside the car body, there being no necessity for cutting out the corner seats for doorways. Folding seats are also arranged to be let down on the front platform, giving room for six passengers in addition to those in the interior of the car body.

THE WESTINGHOUSE HORIZONTAL DOUBLE-ACTING GAS ENGINE.

At the end of March, 1908, there were 122 power plants equipped with Westinghouse producer gas engines, comprising 271 engines and aggregating 68,000 brake horsepower, or an average of 553 horsepower per plant. The engines averaged approximately 250 horsepower each, and all equipment contained in the above total was either in operation at that date or in course of erection. The largest producer plant, about 3,000 brake horsepower, operates the works of the Winchester Repeating Arms Company, New Haven, Conn.

Contrary to the general impression, parallel operation at all but excessive frequencies has ceased to be a difficulty. Although spring couplings are used in the vertical type single-acting engine, they are unnecessary in the horizontal engine, except for special cases.

Recognizing the definiteness of the point of overload capacity, the rating of Westinghouse gas engines is placed at the conservative figure of 10 per cent below the maximum load the engine will sustain for a considerable period. Thus, an engine rated at 500 horsepower could sustain 550 horsepower for long periods. Owing to the high efficiency of the 4-stroke cycle gas engine, economy is largely independent of the size of the unit, so that a 200 or 300 horsepower engine is nearly as efficient in heat consumption as an engine of 1,000 or more horsepower. Both show a heat consumption of close to 10,000 British thermal units per brake horsepower-hour, and this efficiency is largely independent of the kind of gas used, due to the fact that leaner gases will stand higher compression, up to 200 pounds for furnace gas. The tandem cylinder arrangement is standard for all sizes of engines, whether



Pay-As-You-Enter Car—Front Platform (Left), Rear Platform with Exit Door Open (Center) and Closed (Right).

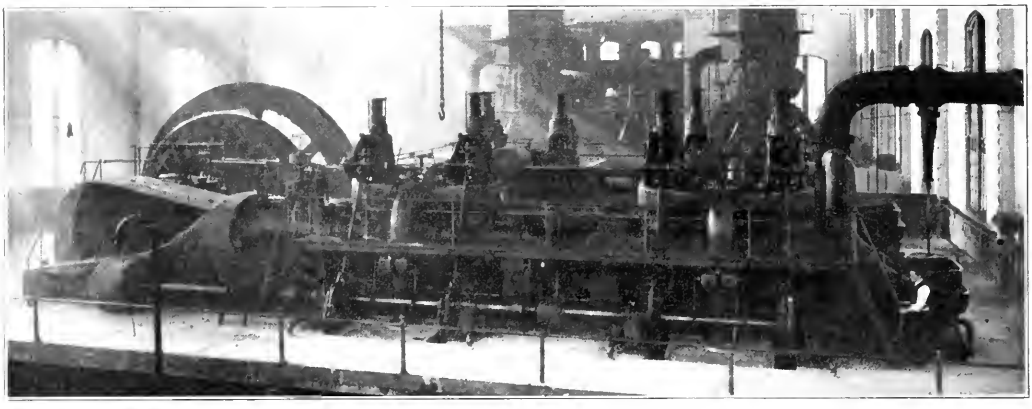
single or double crank. The former gives two power strokes per revolution, the latter four power strokes per revolution, with cranks at 90 degrees. This tandem arrangement, with reasonable size flywheels, easily yields a turning moment sufficiently uniform for all tandem work.

The cylinders of the small engines are symmetrical 1-piece castings, having an opening in the jacket walls, thus avoiding shrinkage in casting. Split jacket bands close the openings with joints made of a flexible packing, which permits the cylinders to expand independently of the jackets. Suitable openings in the jacket walls permit cleaning the water spaces, which are completely accessible by removing the jacket band and water rings at the bottom, surrounding each exhaust. As previously mentioned, all Westinghouse horizontal engines are of the side crank construction, necessitating the alignment of but two bearings. The smaller shafts are solid forgings and the larger ones are bored hollow. Cranks, counterweights and crankpins are cast in one piece, with the pin at the bottom of the mold to insure homogeneous metal.

The pistons are cast in one piece, symmetrical in design, and avoid internal ribs or sharp corners and without the use of chaplets or other methods of core support. They are permanently mounted on the rod with a straight press fit and a retaining nut turned off flush with the piston after being set up. Rods are made in two parts so as to permit removal through front and rear housing, which avoids the extra building clearance for a through rod. They are bored hollow for cooling water, except at the center of the piston, where the ducts connect. Instead of a single governor valve controlling all inlets from a single point, the governing is accomplished directly at each inlet, the inlet valve performing the function of mixing and governing. Thus gas and air are mixed only at the point of entry to the cylinder, and in exact quantity required by the load,-a condition of sensitive governing.

An excellent feature of this engine is that only one eccentric is employed to operate both inlet and exhaust valves, instead of independent cams or eccentrics. This eccentric motion is transmitted by pull rods to a rocking cam motion similar to that used in marine work. Inlet and exhaust are, of course, reversed to accomplish the valve openings at proper points in the cycle. This motion gives the very desirable maximum power at opening, followed by rapidly increasing lift as the valve opens without bringing heavy thrusts upon the eccentric. With fixed eccentrics and no lost motion, it is evident that no opportunity exists for change of adjustment of valves except from wear of the rolling cams, which is obviated by the use of generous contact areas well lubricated. Make and break ignition has been adopted to the exclusion of all other systems after much experimenting, as the most practical for average conditions. Platinum points formerly used are now entirely done away with and cast-iron or a special bronze is employed for the moving contact, working against a fixed steel terminal. High voltages and low current furnished by a small motor generator give the desired results.

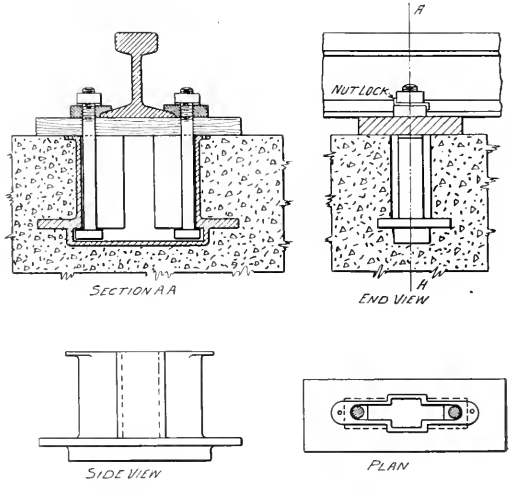
Recognizing engine lubrication as a vital necessity the builders have relieved the operator entirely of the work by automatic lubrication. In a number of 500-horsepower plants cylinder oil consumption is as low as from three to five gallons per week when working 10 hours per day. Engine oil is served by a gravity system, including pump, filter and elevated reservoir with individual sight feeds, all controlled by a single valve so that individual adjustments, once set, need not be changed. One of the engines here illustrated is in the Bessemer works of the Carnegie Steel Company, and is operated by blast furnace gas. It drives an electric generator (1,500 kilowatts direct current) and is rated at 2,400 brake horsepower. The cylinders are 40 by 54 inches and speed 75 revolutions per minute.



Westinghouse Horizontal Double-Acting Gas Engine—Engine at the Bessemer Plant of the Carnegie Steel Company.

BEILHARZ HOUSING FOR EMBEDDED BOLTS.

The accompanying illustration shows a design of metallic housing or socket for securing bolts in concrete or masonry, a patent upon which has been applied for by W. E. Beilharz, 409 Union building, San Diego, Cal. As is apparent from the drawing, the design is such that the bolts can be removed or renewed without difficulty. The chamber inclosing the head prevents the bolt from turning and the lower flange of the casting constitutes an anchor. The small lugs at the top are provided for securing the housing to the forms or templets while being embedded. This housing is intended to be used wherever expansion or other bolts embedded in masonry are required and the application to concrete railroad ties is apparent. Dimensions can, of course, be varied to suit conditions. The illustration shows the housing as applied to a railroad tie.



Beilharz Housing for Embedded Bolts.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Wanted—Position as armature winder and mechanic. Ten years' experience. Can furnish good reference. Address "No. 586," care of Electric Railway Review, Chicago.

Expert street car electrician, city or interurban lines, desires a change. Fifteen years' experience; capable handling men; also railway park manager. Now with a large railway. Address "No. 578," care of Electric Railway Review, Chicago.

Transportation man of seventeen years' experience, young, reliable and thoroughly familiar with organization, dispatching and timetable work, desires a position as superintendent or one of equal responsibility. Highest references regarding character, ability and past service. Address replies to "No. 577," care Electric Railway Review, Chicago.

Position wanted with a proposed interurban electric road by a man with eight years' experience in the preliminary work. Can take complete charge of the engineering work, procuring right of way, franchises, stock selling; and also knows the conditions which must exist before a road can be successfully financed. Address "No. 584," care of Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Wanted — Middle-aged man with 26 years' experience in railway operation and supplies and equipment wants to represent good firms in the southwest, with headquarters at Oklahoma City. (By permission refers to Electric Railway Review.) Address "No. 581," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

Wanted—Position as superintendent of rolling stock or master mechanic on city or interurban railway. Have satisfactorily handled similar work on large metropolitan properties since horse car days. At liberty now; references exceptional. Address "No. 580," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Detective, three years' experience. Both ends. Do you expect a strike? If you do I can make you a good proposition. Address "No. 587," care of Electric Railway Review, Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

Wanted—Copies of Street Railway Review, January to June, 1906, inclusive, and one copy each January and February, 1906. Also Electric Railway Review for January 5, 1907. State condition and price. Address "No. 582," care of Electric Railway Review, Chicago.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

BOOKS AND PUBLICATIONS.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

Car Jacks Not Needed in Massachusetts.

There are many instances which demonstrate that an intelligent board of railway commissioners is of great value to the roads operating under its jurisdiction. This statement is confirmed by a recent example in Massachusetts. Some time ago the legislature demanded an inquiry with a view to the issuing of an order which would compel electric railways to carry on their cars lifting jacks and possibly tackle, so that after an accident a body might be removed before the arrival of an emergency crew. The Massachusetts board now points out that this scheme is not feasible. It states that nothing that has come to its attention in the way of information convinces it that any type of lifting jack now available would serve the intended purpose if placed in the sole charge of a car crew. Only the assistance of trained emergency men with their blocking, chains and ropes would make safe the raising of a car body or trucks. Otherwise would a living human being be under a street car he would be subject to hazardous attempts by inexperienced men to lift the car, which would more than likely result in his receiving additional injuries. Also those handling the jacks, unless experienced, and bystanders, who would naturally be drawn to the scene of the accident, might be injured by the slipping of the jacks or the overturning of the car body. As the result of its inquiry the board has stated that it considers the safety of the traveling public paramount to any consideration of economy, and while this board has been authorized to recommend the equipment of all cars with jacks if it deemed this plan best, yet it feels that more satisfactory results can be obtained by the present method of stationing trained emergency crews with their necessary equipment at suitable points along the routes.

Grading of Creosotes.

In the preservative treatments of timbers and ties for railway and electric railway work creosote is so important a factor that it seems strange that more is not generally known of the value of its various chemical constituents. Creosote under present practice is made to conform to certain liberal specifications formulated after the ideas of the engineer or manager prescribing them and usually having no better foundation than an individual opinion influenced by a possible single practical test with creosote said to have the analysis specified. The result is that we find a large number of sets of specification extant which are widely different in essential features. It is true that creosotes intended for one purpose may not be suitable for another purpose allowing a different degree of exposure or a different volatilization, but there seems to have been no especial consideration given to these conditions in the specifications referred to. The forest service of the United States department of agriculture has conducted a series of tests upon creosotes and recommends for practical purposes two methods of analysis. Creosote is divided into four grades, dependent upon distillation, the index of refraction and other factors, and the uses to which each grade is applicable are prescribed. While these uses indicated probably will not prove entirely in accord with the developments of practice there is undoubtedly much of unusual value in the report. It should serve to effect the abandonment of the practice of adopting or using haphazard specifications or of buying all creosotes upon the same basis. Certainly enough money is being expended annually upon creosotes to warrant the giving of most careful consideration to the values of its different properties and consequently to the return upon the money invested.

Review of Timber Preservation.

It has been difficult for the average engineer or railway official to keep in touch with the many new processes of timber treatment which have been developed in the past decade in which the necessity for timber preservation began to be fully appreciated. A review of the more important of these processes and a brief description of the methods and materials used is given in a paper by Eugene P. Schoch of the University of Texas before the Southwestern Electrical and Gas Association at El Paso, Tex., May 7, 8 and 9, which is abstracted in this issue of the Electric Railway Review. By considering the item of cost for each kind of treatment he presents figures which will enable one to form a correct idea of the relative merits of the several processes considered from a practical point of view. The cause of decay, the value of seasoning, the action of the preservative agents and the method of application or injection are also outlined. It is singular that very few articles have been written which treat of the broader subject of wood preservation in its details, although many have been published describing separate processes. The problem has now been narrowed down to five or six methods of treatment, such as the Burnett process, the Wellhouse process, straight creosote, zinc chloride, zinc tannin and creosote-zinc chloride. These have proved satisfactory when properly applied and when used in climates to which they are best suited.

Watch the Gas Engine.

The all-prevailing desire for greater economies in current generation has brought about the present widespread study of internal combustion engines. There are gas engines which are said to have been operating satisfactorily under the severe electric railway service for a number of years, and yet many power station engineers are just now being convinced of their future. With the increasing scarcity of coal there must follow prime movers which can utilize other fuels or operate with less coal per unit of output. The gas engine seems to fulfill this latter requirement and the problem now confronting its designer is to increase its reliability of operation. The character of the gas fed to an engine has largely to do with its smoothness of operation. In this issue W. B. Tuttle, vice-president and general manager of the San Antonio Gas & Electric Company, presents an especially thorough discussion of one phase of the gas engine fuel problem. He describes the various types of gas producer plants, compares their methods of operation and exhibits test data with which to substantiate his statements. A statement in his conclusion is worth repeating: "The reliability of the service of gas engines operating on producer gas has been established, but in this connection it is well to call attention to the fact that all gas engines require

greater care on the part of the operators than do steam engines. * * * While careful attention should be given to a steam plant it must be given to a gas engine plant."

EXTRA CHARGE FOR TRANSFERS IN PHILADELPHIA.

Announcement that the transfer system of the Philadelphia Rapid Transit Company will be radically changed denotes action that is consistent with the recent curtailment of transfers between the lines of the New York City Railway and the Third Avenue Railroad of New York. In two of the leading cities of the country important steps have now been taken to prevent abuse and overcome the unprofitable effect of too general acceptance of overliberal transfer privileges. The attention of managers has been upon the leaks attending transfer systems for a long while, and the crystallization of opinion into action in New York and Philadelphia affords precedents which other companies may follow with wisdom.

In discussing the transfer system which has prevailed in Greater New York, J. F. Calderwood, third vice-president and general manager of the Brooklyn Rapid Transit Company, stated in an interview, which was republished in the Electric Railway Review of April 11, 1908, page 461, that "the number of transfers issued by * * * the traction companies of the larger cities * * * has increased to an alarming degree." It frequently requires courage to deal with a situation of this character when it is possible that the announcement of a change will bring criticism and perhaps political abuse and injustice upon a public service corporation. The directors of the Philadelphia Rapid Transit Company, however, have determined to attempt to solve the transfer problem in their city. Liberal extension of the transfer privilege in Philadelphia has continued, as in many other places, with development of properties and public insistence upon longer rides for one fare. Directors of this company have evidently been obliged to consider plans for increasing the gross and net revenue. Under the new contract between the Philadelphia Rapid Transit Company and the city of Philadelphia, entered into on July 1, 1907, it was provided that present rates of fare might be changed only with the consent of both parties to the contract. With this clause of the contract in mind certain directors suggested unofficially some months ago that a revision of fares be made in order to raise the revenues of the company to a point commensurate with the larger cost of operation. The suggestion, though only tentative, met with so much opposition that formal or further consideration of any change was abandoned. A special committee of directors was appointed to study the subject of abuse of transfers and the present action of the board is based upon the conclusion of this committee that the only certain method of stopping abuses would be to require the passenger to pay something more for a ride with a transfer than for a trip without transfer, and to issue transfers upon request at the time of payment of fare only. This committee consisted of John B. Parsons, president of the company; J. J. Sullivan, W. H. Shelmerdine, Clarence Wolf and Mayor Reyburn, the latter being ex officio a member of the board.

Pursuant to the recommendation of this special committee the directors met on Monday of the present week and passed an order providing that on and after May 18 a free transfer ticket would be issued only upon the payment of a 5-cent fare and only when a passenger requested a transfer at the time of paying the fare.

As the contract with the city contains no reference whatever to the issuance or regulation of transfers the company is not hampered by municipal interference in its reform. The company has long suffered from serious abuse of the transfer privilege, and previous efforts to remedy the abuse and to regulate the use of transfers have been ineffectual. The plan of giving the transfers to passengers as they alighted from cars was tried but after experiment the conclusion was reached that this system would not yield the desired results. It was found that transfers were sold by conductors in some cases and that boys and keepers of small stores disposed of large numbers of transfers. Under the new plan the company will discontinue the practice which it has followed in the past of giving transfers for tickets costing an average of 4 or 4⅛ cents each.

The use of transfers in many large cities has undoubtedly reached a point where it involves not only waste but great loss to the transportation corporation. The situation respecting transfers should be investigated carefully by every large company. With operating expenses as high as they are at present and with slight prospect of a reduction in expense it is necessary that the public should bear its proportion of the added cost met by the company in furnishing service. Curtailment of the transfer system will aid in raising net revenues to levels where they will permit proper returns on the investment.

THE EXPANSION OF SHOP EQUIPMENT.

As business develops on a small or medium sized electric road it becomes something of a problem to know how to fit the shop equipment to the situation. Labor-saving devices are helpful on large roads as well as small, but as the number of cars to be maintained increases the need of specialized tools becomes more pressing if repairs are to be handled quickly. A company which has to maintain only a dozen or two cars naturally cannot as a rule afford many refinements in its shop facilities, and in such cases the use of home-made "rigs" and "kinks" pays a heavy interest on their cost. When the total volume of repair work to be handled reaches a point where the time required to place the work in the tool is important, then it is well to consider whether or not a standard machine tool built to perform certain operations in a positive and continuous way will not be efficient enough to warrant its purchase.

From the standpoint of the mechanical engineer interested in shop production in a broad way the average small electric railway repair shop depends too much upon makeshift methods. Such a man feels that the tendency of the shop is away from these methods as the demand for its work extends. The practical street railway master mechanic, on the other hand, finds in the home-made device a chance to save in the first cost of shop equipment, and when the apparatus is set up ready for the work it usually is the case that the job can be done with as much economy as with the more expensive tool bought in the machinery market. The fact is, however, that as the road grows and more cars are handled in the shops, if one or two tools are depended upon for a variety of operations, there is apt to be more or less delay in the work, for the demand upon the individual tool tends to become too large for it to handle.

Each road must decide for itself when the conditions require the expansion of its shop equipment, but in facing this question it is interesting to consider what are the essential tools of a street railway shop from the point of view of the machine shop expert who is studying the general problem of production rather than the administration of repairs on a road of limited means. Such a man will probably say that the indispensable tools for a good machine repair shop are a car wheel lathe, grinder, axle lathe, engine lathe, milling machine, planer, drills, grinders, bolt cutters and forges. To these may be added, as the company can afford them, a punching and shearing machine, power hammer, pipe cutting and threading machine, power hack saw, boring mill, radial drill, turret lathe and shaper. There is still a chance in many small shops for the more extensive use of small cranes and hoists and many shops are not yet equipped with enough woodworking tools.

Such a list as this looks rather extensive for the average

small road, and yet we venture to say that as shop practice becomes more and more settled in its methods on a road and as the conditions approach those of the factory in parts of the repairs undertaken, the above list will not seem too large for economical service. The repair of electric railway rolling stock is never likely to become a sequence of production processes in regular order, such as may be found in the ordinary manufacturing plant, but as the quantity of work to be carried on grows larger it will pay the operation company to extend its tool list rather than to depend too much upon substitute methods. The time element is the important factor in the cost of car repairs on all systems, but it is felt more in the shop as the total number of cars repaired increases.

ANNUAL REPORTS.

United Railways Investment Company.

The United Railways Investment Company of New York, a holding corporation which controls the United Railroads of San Francisco and the Philadelphia Company of Pittsburg, has made its report for 1907. The figures, with a comparison with the previous year, make the following showing:

	1907.	1906.	Increase.
Gross income	$1,569,861	$1,331,222	$226,642
Expenses	67,639	28,897	38,742
Balance	$1,493,225	$1,305,325	$187,900
Charges	1,090,591	582,110	508,481
Net income	$ 402,634	$ 723,215	*$320,581

*Decrease.

The principal source of income was the dividends received and accrued on stocks owned, which amounted last year to $1,457,772, as compared with dividends received of $1,295,398 in the preceding year. The larger charges resulted mainly from the greater amount of bonds outstanding and an increase in bills payable. The amount of loans and bills payable on December 31, 1907, was $2,061,488, while the balance sheet of one year before showed $1,000,000 notes payable. Current assets amounted at the close of 1907 to $1,782,323, and current liabilities to $2,443,804, an excess of liabilities of $661,481.

The amount of collateral trust 5 per cent bonds outstanding at the end of last year was $18,150,000, as compared with $15,750,000 at the conclusion of 1906. The preferred and common stock issues were unchanged at $15,000,000 and $19,400,000, respectively. Preferred stock dividend certificates aggregated $1,462,500, as compared with $1,087,500 at the end of 1906.

In his remarks to shareholders Ernst Thalmann, the president, says:

No dividends in cash or scrip were paid during 1907 by the United Railroads of San Francisco, all its receipts over and above fixed charges and expenses, and all the surplus earnings of the Philadelphia Company, above the amount of dividends paid by it, having been retained by the respective companies for their respective corporate purposes.

The most salient feature in the financial history of your company was the strike on the lines of the United Railroads of San Francisco. At the date of presentation of the last annual report your directors firmly hoped that some arrangement, fair and just, both to the employes and to the company itself, would be amicably reached, their hope being founded on the facts that the United Railroads of San Francisco had fulfilled the requirements of the decision of the arbitrators fixing a rate of wages for the period terminating May 1, 1907, and that the officers of the United Railroads were prepared to meet the demands of the employes in a reasonable and conciliatory spirit. These reasonable expectations were not fulfilled, and a strike on the part of practically all of the employes of the United Railroads began on May 5, 1907, and lasted approximately six months. The lines of the United Railroads were subjected to a persistent and continuous boycott. Furthermore, the employes were exposed to repeated attacks, and their lives for the greater portion of that period were constantly in danger. Through the efficient management of the officers, involving a complete disregard of all considerations of their own personal safety, the result of the strike was never for a moment in doubt, and though it resulted in a large immediate loss, it is the belief of your board that the ultimate outcome will be beneficial to the city of San Francisco and to your company.

Naturally, the earnings of that company during this period fell to an extremely low figure, but they have recently regained their former level. The earnings for March, 1908, were $558,932, while those for March, 1907, were $537,700. This comparison furnishes reasonable ground for encouragement as to the future. The consensus of reports received from those familiar with existing conditions in San Francisco justifies a firm belief that the future prosperity of that city is assured, and in that future prosperity there is every reason to believe the United Railroads of San Francisco will fully participate.

The losses sustained by the United Railroads of San Francisco through the strike, as well as the financial requirements of that company, among other things, rendered it both impracticable and inadvisable to issue the $3,000,000 of 3-year notes of this company and to carry into effect the contemplated plan with respect thereto. A substitute arrangement has been carried into effect since the last fiscal year, which in the opinion of the board will result beneficially to your company as well as to the United Railroads. Your company subscribed to the remaining $3,500,000 (par value) of cumulative first preferred stock of the United Railroads, and made the shares of such first preferred stock owned by this company, including the shares to be issued to it under such subscription, the basis for $3,500,000 of 6 per cent notes of this company. The United Railroads of San Francisco is to apply the proceeds of the subscription to the stock toward the payment of its floating indebtedness.

Mr. Thalmann adds that the proceeds of the stock extinguish practically all of items aggregating $1,469,427, upon which the Investment company had a contingent liability on December 31, 1907.

Washington Railway & Electric Company.

The report of the Washington (D. C.) Railway & Electric Company for 1907 shows, as compared with the results of 1906, increases of 8.06 per cent in gross earnings, 8.41 per cent in operating expenses and 7.69 per cent in net earnings. Miscellaneous income was slightly reduced, but the addition to fixed charges was less than the increases in the items of gross or net revenue from operation, and the surplus available for distribution to shareholders showed a gain of 9.26 per cent. Operations of the last three years compare as follows:

	1907.	1906.	1905.
Gross earnings	$3,385,748.58	$3,133,240.52	$2,905,907.35
Operating expenses	1,748,752.58	1,613,096.71	1,478,466.55
Net earnings	$1,636,996.00	$1,520,143.81	$1,427,440.80
Miscellaneous income	42,353.18	44,595.59	50,553.47
Gross income	$1,679,349.18	$1,564,739.40	$1,477,994.27
Taxes	170,029.09	157,682.29	149,156.79
Interest	937,199.34	883,436.12	850,298.57
Total charges	$1,107,228.43	$1,041,118.41	$ 999,455.36
Net divisible income	572,120.75	523,620.99	478,538.91
Dividends	425,000.00	425,000.00	425,000.00
Surplus	$ 147,120.75	$ 98,620.99	$ 53,538.91

The percentage of gross earnings required for operating expenses in the last year was 51.66 as compared with 51.49 per cent in 1906 and 50.86 per cent in 1905. Totals of the operating expenses are given, but no division of the expenditures as between maintenance and the cost of conducting transportation is shown. The report states, however, that the cost of maintenance increased last year $98,822 or 26.12 per cent. From this it may be computed that the total expenditure during the year for maintenance was about $477,122 or about 27.3 per cent of the total operating expense or about 14.1 per cent of the total gross earnings from operation. Allan L. McDermott, the president, states that the slight increase in the operating ratio is due to a continued increased expenditure for maintenance. He adds that the increase in cost of mainte-

nance "is partly due to the continuation of the policy of your management of endeavoring to maintain your properties each year in better condition than heretofore and, as in the previous year, to the increasing cost of materials which enter into the construction and operation of such properties."

Charges to capital account during the year amounted to $1,146,005, of which $914,175 was for account of the Potomac Electric Power Company and $102,293 represented the discount on securities issued by the Washington Railway & Electric Company and the Potomac Electric Power Company and sold for construction purposes.

Credits to capital account during the year aggregated $91,526. Underlying liens amounting to $912,881 were retired and obligations of a total of $2,073,250 were issued.

The total funded debt on December 31, 1907, was $13,073,709 and there were outstanding $8,500,000 preferred stock and $6,500,000 common stock. The cost of property stood on the balance sheet at $27,871,483.

CLASSIFICATION—ESSENTIAL CHARACTERISTIC OF SIMPLICITY IS LACKING.

To the Editors:

A review of the tentative classification as prepared by the interstate commerce commission indicates that it has taken electric railways as similar in organization, operating conditions and characteristics to the steam railroad companies. This is not the fact, as any one who is at all familiar with the organization and operation of these two common carriers knows, and as has been shown in a number of articles published in this and other technical journals on the subject. The action of the interstate commerce commission in submitting a tentative classification of operating expenses for electric railways with the steam road classification as a basis, crudely modified to meet some electric railway conditions, is not easily understood, especially when the commission has at hand the best thought on the subject of classification of accounts for electric railway properties, represented in the "Classification" committee of the American Street and Interurban Railway Accountants' Association.

In preparing a classification of accounts to apply to all the electric railways having organizations, characteristics and conditions of operation—many of these conditions being imposed by ordinances of municipalities in which they operate—varied to the extent that there are hardly two electric railway properties that operate under the same conditions, and in view of the fact that a large percentage of electric railways is operated in connection with electric lighting and often with gas and electric light and water plants, it is absolutely necessary that the classification which would be uniform on all properties must have simplicity as its most prominent characteristic, should provide only for the least number of accounts that would indicate the essential features of maintenance and operation and allow as many subdivisions as any property, however large, may wish to make, being applicable at the same time to the smaller companies without subdivision.

There are three purposes to be covered in a uniform classification of accounts:

First—It should be designed to show operating and departmental costs of value to the individual road, which must be done in order that the road may be operated economically.

Second—To form a basis of comparison between the operation of different electric railway properties, not only for the railway companies themselves but for the public at large.

Third—For general statistical purposes.

That the tentative classification as prepared by the interstate commerce commission does not contain the essential characteristic to make it of value as a uniform classification, namely, simplicity, is patent to every one. Even though the accounts as outlined in this classification could be made to apply to electric railway properties, which is not the case, it is deficient as a uniform classification because of the many proportionate charges necessary to follow out its provisions and the various joint facility accounts, the numerous adjustment and clearing accounts making operation under this classification a most complex problem and producing, as the classification certainly would, a mass of figures intended to represent maintenance and operating costs, which would simply be a compilation of guesses for every company operating under the classification; none of the three purposes for which a uniform classification should be designed would be accomplished.

Some of the provisions of the interstate commerce commission tentative classification, especially that of separating a service rendered by an outside company, or maybe an individual, into what represents cost of manufacture to the outside company or individual and what represents a return on the capital invested are absurd. The most striking example of this is in account No. 79, "purchased power." The text indicates that "power purchased" must be divided as between cost of manufacture and use of capital, the cost of manufacture being charged to operating expenses and the expense which represents use of capital to the income account. Therefore, if a railway company purchased power from an electric power company, which many do at a certain price per kilowatt-hour of consumption, the electric power company must inform the railway company what it costs to manufacture the power so purchased and what represents a return to the power company on the capital invested in its plant. It is not likely that an electric power company will tell its customer (the railway company) what it costs to manufacture the power, and if figures were given as to cost of manufacture they would probably be entirely unreliable for obvious reasons. If this principle were followed out in its entirety it might be carried back to the mines where the coal used by the electric power company is mined, to get first cost or what represented cost to the mining company mining the coal and what represented a return on the capital invested in the mines. One would have just as much reason to expect the coal mining company to give this information to a purchaser of coal as to expect an electric power company to give a statement showing the detailed costs to a customer who purchases power.

The division of electric railway companies into two classes, one to use a classification consisting of 22 accounts and the other or larger companies to use a classification consisting of 116 primary accounts, is another feature of this interstate commerce commission tentative classification that makes it valueless as a uniform classification. By dividing the electric railway lines into two classes the commission practically destroys the value of the classification for statistical as well as for comparative purposes. With one class of electric railway properties using 116 primary accounts and another class using only 22 accounts the statistics of the entire industry cannot be tabulated consistently. The best that could be done for statistical purposes would be to condense the operating expenses of the companies using the 116 accounts into the 22 accounts used by the smaller companies.

The operating expenses of the smaller companies using the 22 accounts could not be distributed over the 116 accounts as kept by the larger companies and therefore the data obtained from the companies using the 116 accounts would be of no practical benefit. The same criticism applies when it comes to a comparison of operating costs as between a company using 22 accounts and one using 116 accounts.

This tentative classification is not consistent in its treatment of material and labor charges. In a number of accounts under the head of "maintenance of way and structures" mate-

rial only is to be charged, while the labor of applying the material charged to these several accounts is all included in one account entitled "roadway and track." Other accounts cover both labor and material and it is essential that all accounts should do so. Why is the labor separated from the material in these special accounts and not in all accounts?

Under a number of the principal maintenance accounts of this tentative classification the following note appears:

"This account may include each month a proportion of the total amount authorized or approximated during the fiscal year, regardless of the month in which the actual expense is incurred."

This is not good practice because it does not show the true facts. The estimated amount based upon the annual appropriation for certain work may be far from the actual cost and for 11 months of the year accounts thus treated would simply represent guesswork, misleading to the operating officials as well as for statistical purposes, particularly when the units of cost per car-mile or per car-hour are applied to the individual monthly operating expenses. One month of the year must take up the deficit or surplus on the various appropriations made.

No good purpose can be served by adopting a classification as uniform which will practically destroy the records of maintenance and operating costs on electric railway properties for the past series of years, as this tentative classification submitted by the interstate commerce commission would most certainly do. It is to be hoped that the electric railway companies will be given due consideration in this matter before any classification is adopted by the interstate commerce commission.

S. C. ROGERS,
Treasurer and Auditor Mahoning & Shenango Railway & Light Company.

Youngstown, O., May 1, 1908.

THE PUBLIC SERVICE LAWS OF WISCONSIN.*

BY PROF. B. H. MEYER, CHAIRMAN WISCONSIN RAILROAD COMMISSION.

The public utilities law requires among other things the commission to value the property of all the public utilities, specifically, all the property "used and useful" for the convenience of the public. The question arises: What is property "used and useful"? The first step is a physical valuation. An engineering staff of some 30 men, organized in groups, each with its special line of work, is assigned to this. On the basis of their statistics a certain price is agreed upon for the different physical parts of the plant, the sum total of which will be the value of the physical property. After such physical valuation has been tentatively worked out a day is set for hearing.

Perhaps the most difficult question that has arisen here is the amount that should be allowed over and above the value of the physical property of the utilities. It is argued, for instance, that you may have in your possession all the parts of a chair and the labor required to put that chair into shape paid for in advance, and yet the combined cost of the parts of material and the labor going into that chair do not constitute its value. How much shall be added? The representatives of the utilities say that all the way from 5 to 100 per cent shall be added, and the line of reasoning in support of this, generally speaking, appears to be something like this: If the price of gas is $1.25 and the price of light, say, is 15 cents per kilowatt-hour, and you, representing that utility, find that you must add to the physical value 50 per cent in order to justify your rate, you tell us you claim 50 per cent "going value"; and if you find you must add 75 per cent you state that 75 per cent is the "going value." In other words, "going value" can be made a general, elastic term to express whatever value is required over and above the physical value to justify whatever rate you choose to put in.

Now, there are, of course, in the term "going value" certain definite things. I want to say that I am still open to conviction, but have very strong suspicions in certain directions. If, for instance, the representative of a utility can show that in building up a business he has spent so much money; that during the first five years he just covered operating expenses and perhaps paid only 2 or 3 per cent additional, and that for the next two years he paid 5 or 6 per cent, and then, finally, after 10 years he paid 8 or 10, then I imagine we would all agree that he is entitled to some return now, because of the fact that during the first three, four or five years he earned nothing, or very little, or possibly went in debt. That is a tangible and demonstrable thing. But when you have the physical property and the amount expended in getting your customers, when all that is accounted for, and then you come in and ask for an addition of 25 or 50 per cent, I think you will agree with me that you must show some adequate reasoning besides the mere say so of somebody's "judgment."

Then there is the matter of standards. With a view of arriving at certain standards which the commission might promulgate, as it is required to do under the law, a conference was held with representatives of all the utilities in the state. As a result of this conference the commission hopes to announce a few relatively simple rules which can be applied immediately, and then to elaborate and add to them. A great deal can be said about unjust discrimination in the service and rates of public utilities. Free and reduced rate service exists very generally, and to a certain extent still exists, because under the law many of these discriminations cannot be removed without an advance, and, as no rate can be advanced without authority, these discriminations will continue until the commission can get around to them.

Professor Meyer then answered questions from various members, saying in part:

The owner of a telephone plant in a small town applied for permission to take out of his schedule a combined business rate of $1.75 and put in a residence rate of $1.00 and a business rate of $1.25. The commission felt it could not decide the question, which involved an advance in revenues of something like $30 a year, without having an actual valuation made. An expert accountant went over the pocket memoranda and other documents of the owner and the engineers took an inventory. Putting their findings together the commission found that this proprietor, without charging anything for his own personal services or for depreciation, had made scarcely 4 per cent on his actual money investment in the telephone business. In the electric light branch, without allowing him anything for services, or for depreciation, he had $126 at the end of the year. This is only one illustration of how this law will put the administration of public utility properties on a business basis.

The commission is obliged to prescribe a uniform system of accounts. In that system of accounts, depreciation, for instance, is expressly provided for. How much that shall be is a question of fact in each case; but depreciation must be provided for and all accounts kept in a certain way, so that at the end of a financial period it is possible, or rather will be possible, to make comparisons among the different utilities throughout the state, not only the different company utilities, but also the municipal utilities. It will not be possible hereafter lawfully to charge to the street cleaning department the labor of 25 men, say, for three months, who have been working for the water department, if the water department is a public enterprise.

If the valuation is not satisfactory there is an appeal, as well as in all other cases, to the circuit court, and from the circuit court to the supreme court. The record before the commission is made the record before the circuit court, and no new evidence can be introduced. Cases of appeal from commissions to courts have frequently been made new questions before the courts. Railways or utilities have not always tried cases on their merits before a commission, because they wanted to appeal and make a test before the court. But under the Wisconsin law, if a railway company or a public utility introduces new testimony in court, thereby automatically the case is thrown out of court and back to the commission. If that additional testimony leads the commission to change its decision it may do so. On the other hand, all of the evidence before the commission, or all the facts which weighed in the minds of the commissioners in arriving at a judgment, cannot be made a part of the record on which the case goes to the court, because the commission is not tied down to the technical rules of evidence in hearings, nor is it tied down to the record in the case; it goes outside of the record. However, the commission endeavors at all times to play fair, and to place before the utility or the railway company or a complainant all the information it has.

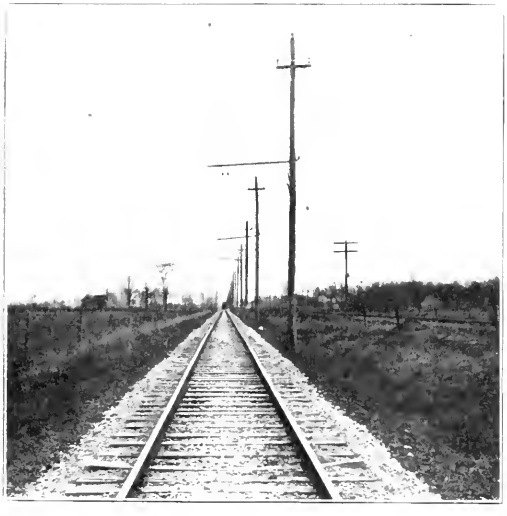
In a state like Wisconsin, in most communities it will be possible to maintain the plant in a good physical condition, to put aside a liberal depreciation reserve, to maintain a surplus fund to carry it through uneven years, and at the same time have very reasonable rates. We hope that investments in public utility enterprises will gain in attractiveness rather than lose.

*Abstract of address delivered before the City Club, Chicago, April 11, 1908.

THE GROWTH OF THE KOKOMO MARION & WESTERN TRACTION COMPANY.

BY C. A. TUPPER, PUBLICITY MANAGER ALLIS CHALMERS COMPANY.

As an illustration of what may be accomplished in building up an existing electric railway, lighting and power distributing system and at the same time strengthening the industrial position of an entire community, the management



Kokomo Marion & Western—Track on Private Right of Way.

of the Kokomo Marion & Western Traction Company furnishes one of the most striking and instructive examples to be met with anywhere in the country. At the time ownership of the system was assumed by the interests now in control, less than four years ago, there was a small street railway and electric lighting plant, having no greater output than 500 kilowatts, a few miles of trackage wholly within the city of Kokomo, Ind., and circuits containing several hundred arc and incandescent lamps. Today 22,000 incandescent and 395 arc lamps in and about Kokomo are supplied with electric current and more than one-half of the company's customers have various electric household devices; factories in the vicinity take upward of 1,000 horsepower daily in current for operating motors; the street railway system has been extended to a trackage of 10 miles, and a finely equipped interurban line 28 miles long extends from Kokomo, a city of about 18,000 inhabitants, to Marion, which has a population of 26,000, through several substantial towns. Further extensions are projected to Terre Haute and Lafayette on the west, distant respectively 130 and 79 miles from the eastern terminus of the road.

Track and Overhead.

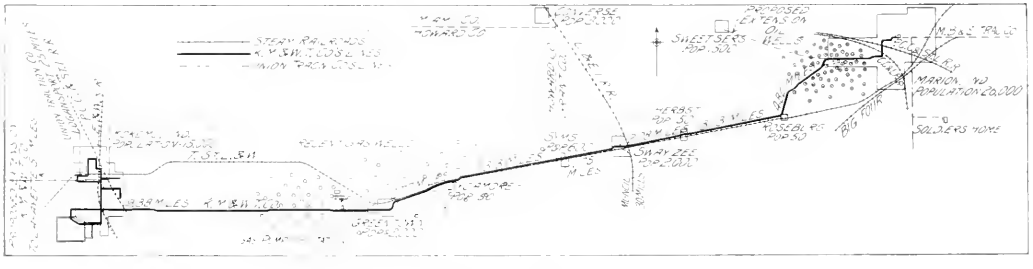
The line of the interurban road, built on a 40-foot private right of way, has easy curves and a maximum grade of no more than two degrees, most of the track being laid on the level. Seventy-pound rail is used, joined by 6-bolt standard splice bars.

The Ohio Brass Company's No. 0000 compressed bonds and soldered bonds are used on the interurban line and No. 00 compressed bonds on the city tracks.

The road is ballasted with crushed stone and gravel six inches deep beneath the ties. The ties are of white oak. Side arm construction has been used for the entire course of the line. The brackets are 9 feet long with 1½-inch tubing made by the Ohio Brass Company. The lightning arresters, four to the mile, are grounded by means of copper wire and ¾-inch iron rods driven into the ground by the side of the pole and also connected to the rail. The trolley wires consist of two No. 000 wires suspended by Ohio Brass Company type D hangers. Feeders of 300,000 and 500,000 circular-mil copper cables feed the interurban trolley wires 10 miles from the power station. The feeder from the substation is stranded aluminum equivalent to 300,000 circular-mil copper.

Cars.

There are six passenger cars, one freight car and one work car. Cars are run on one hour headway, only three being ordinarily in service at the same time. The interurban cars are operated at an average speed of 25 miles per hour. The Jewett Car Company built the cars. They are equipped with four 50-horsepower 93 A motors, K-28 controllers and straight air brakes. Inside they are fitted with every modern convenience, including overhead bundle racks, Peter Smith hot water heaters, toilet rooms and lights of high candlepower. About two-fifths of the interurban car is devoted to a smoking compartment having comfortable arm chairs arranged along the sides, and the remainder has aisle seats nicely upholstered. Direct telephone connection can be opened at any time between the cars and the train dispatcher's office by a pole and hook connection operated in accordance with the Stromberg-Carlson system.



Kokomo Marion & Western—Map of Line and Connections.

The city cars, built by the Cincinnati Car Company, are 22 in number, each having two 40-horsepower 92 A motors and K-10 controller. Some of them are equipped with air brakes.

Car Barn and Repair Shops.

In the city of Kokomo there is a car barn 150 by 50 feet with four tracks and a pit underneath the entire length of one. The repair shop adjacent to this is 45 by 70 feet and contains two tracks, one having a pit 60 feet long beneath it and the other having a pit of sufficient size to be used in taking out a truck. This shop is equipped with a full line of shop tools.

Among outward signs of progress the most prominent is the development of the new power station, which has recently been equipped with two Allis-Chalmers steam turbines and generators having an aggregate normal capacity of 2,000 kilowatts and delivering two-phase 60-cycle current at a terminal pressure of 2,300 volts. The first of these machines, put in operation on February 21, 1907, was found so satisfactory that a second unit of like construction was ordered, the latter being placed on the line on December 7 of the same year.

Power Station Building.

Everything connected with the physical equipment of the system has been very carefully looked after and one of the best evidences of this is the power house itself, which is a well-planned well-built fireproof structure. The exterior walls are faced with standard pressed brick laid in three-fourths English bond, with headers in each fourth course, affording a thorough bond into the wall. All of the interior surfaces in the engine room which have not been enameled are faced with Kokomo pressed sand brick of buff color and the remaining brick work is of the ordinary kiln-run quality. Tile roofing covers the building.

The foundations above grade are of Indiana cut limestone and below of concrete resting on bedrock.

The floors are of concrete with smooth surface, the engine room floor being supported on steel beams and under each of the turbine units there is an independent concrete foundation to a depth of 13 feet 6 inches, foundations for the exciters, condensers and other auxiliaries being correspondingly massive. All machinery foundations rest on bedrock.

Coal Handling.

Coal, consisting of a comparatively low grade of Indiana screenings, is brought in on a spur from the Lake Erie & Western Railway and unloaded through a trestle extending the entire length of the firing room, so that it is heaped up in front of the furnaces, which are hand fired.

Removal of ashes is accomplished by an inexpensive device. Instead of the customary ash pit with track and cars there has been installed a tunnel and screw conveyor through which the ashes are constantly transferred to a pit outside the building. There, by means of a bucket elevator and inclined conveyor, the material is discharged to storage bins at one side of the building and unloaded into cars, which take it to points along the line where it can be used as ballast.

Boilers and Stacks.

The boiler equipment, set on concrete foundations reaching to bedrock, consist of three batteries, two of which include four Stirling boilers, each having a capacity of 235 horsepower and the third comprising one Atlas water tube boiler with a capacity of 400 horsepower. Two of the Stirling boilers discharge into one steel stack, 6 by 80 feet, and the other two, with the Atlas boiler, into a stack 6 by 125 feet, also of steel. The shorter of these stacks is equipped with an engine driven blower, made by the Sturtevant company, by means of which enough draft can be induced to give large temporary overload capacity to the two boilers with which it is connected.

Kokomo Marion & Western—General View of Power Plant, with Storage Battery House in Foreground.

Piping and Auxiliaries.

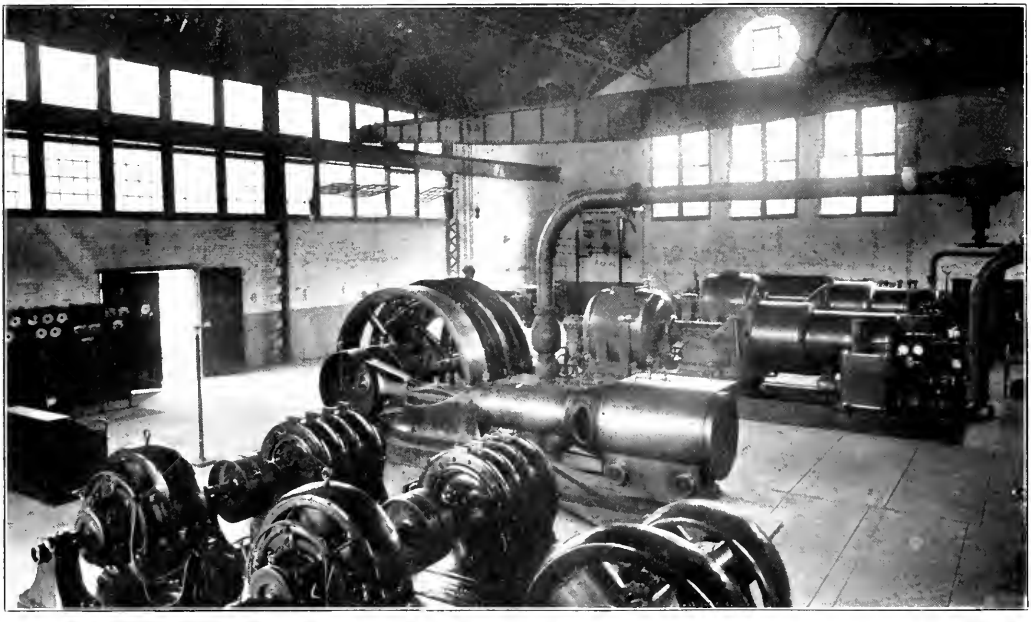
A main steam header 12 inches in diameter, located above the pump compartment in the steam turbine room, is in the form of a loop, from which each turbine unit is fed by a 7-inch pipe. Gate valves are placed between each battery of boilers and between each turbine inlet, these valves being of the Crane type with rising stems. There is aslo a 4½-inch auxiliary header. A proper arrangement of valves enables any part of the plant to be fed from any boiler at will. Heat insulation is provided in the shape of heavy covering, furnished by the Johns-Manville Company. The system includes Cochrane steam separators.

The condensers and all of the other auxiliaries exhaust into a Cochrane heater (with Sorge water purifier), where a temperature of from 200 degrees to 212 degrees F—never less than 200 degrees—is constantly maintained. Water may be drawn from either the condenser suction or discharge pipes, from a deep well or from the city mains, and discharged into an elevated tank which feeds by gravity into the heater and from there by gravity into the boiler feed pumps, or the water may be by-passed directly to the boiler.

Two Worthington pumps are used for supplying the tank

over the heater and two Deam pumps for boiler feed. Either one of any of these two is, however, of sufficient capacity to feed of the water system of the entire plant. The former are now being displaced by a centrifugal pump with 2½-inch discharge, driven by an induction motor supplied with current directly from the main generator buses through a step-down transformer, but the steam pumps will be held in reserve.

Water for condensation and boiler feed is taken from a creek about 350 feet distant through a 16-inch cast-iron pipe and discharged back to the stream through 20-inch tile. The water is drawn from a concrete basin in the creek, 7 feet square inside and extending 6 feet below the water mark, with walls extending to high-water mark and a gate on the down-stream side where the water enters. This gate can be readily closed down tight when desired and the water ex-



Kokomo Marion & Western—Interior of Power Station, Showing Turbo-Generators, Engines and Motor Generators.

hausted by pumps in the power plant, so as to facilitate cleaning the basin of sand and mud.

Steam Turbines.

The turbine operating floor is 5½ feet above the boiler and pump room floor, 11 feet above the basement floor and 30 feet below the roof trusses, the foundation of each generating unit being kept entirely separate from the steel frame of the concrete flooring. Overhead is a 10-ton crane, hand operated.

In this room are placed two horizontal steam turbines and generators, of 1,000 kilowatts capacity each, a 330-kilowatt engine driven alternator operated in parallel with them, the exciter for these units and substation apparatus, transformers, switchboard, etc., as later described.

Incorporated in these turbines are the various patented features controlled by their builder, Allis-Chalmers Company, among which may be mentioned channel shaped shrouds protecting the ends of the blading from injury, machine cut slots in the foundation rings insuring accurate spacing of the blades; a method of fastening the latter which effectually prevents them from working loose, and improved balance-pistons. Other details of special interest will be mentioned briefly under the subjects to which they belong.

The turbines operate at 1,800 revolutions per minute, with a steam pressure of 140 pounds at the throttle, dry saturated, and a vacuum of 28 inches of mercury referred to a 30-inch barometer at the exhaust nozzle. Large temporary overload capacity has been provided for in the design of these machines; high efficiency is maintained, and close regulation secured, even under the most unfavorable operating conditions, as a result both of good design and efficient station management. The turbines are frequently run six weeks at a time without taking the load off and then only to make inspection.

Bed Plate.

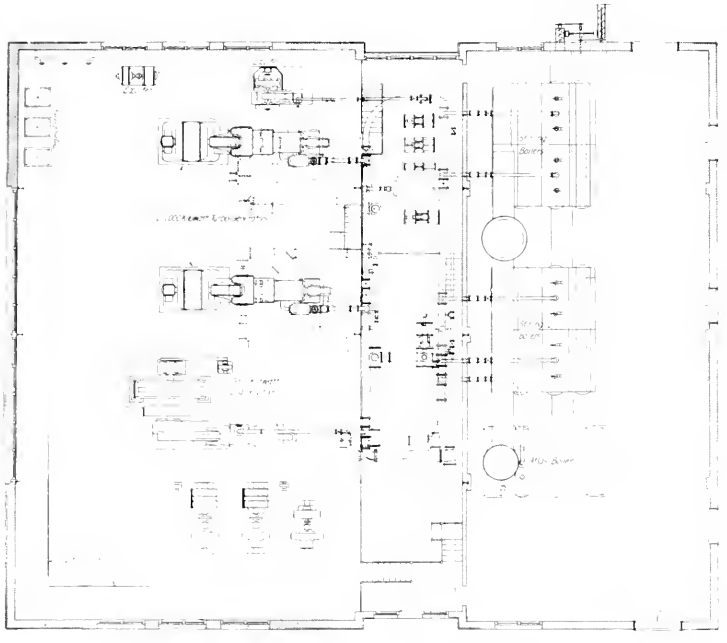
The bed plate is divided into two parts, one carrying the low-pressure end of the turbine and the bearings of the generator and the other the high-pressure end of the turbine. The turbine is secured to the former, while the latter is provided with guides which permit the turbine to slide back and forth with differences of expansion caused by varying temperature, at the same time maintaining the alignment. This arrangement permits of the utilization of the entire space between the foundation piers and below the turbine, for the condensing apparatus. A grating is provided in the engine room floor directly over the condenser pumps and engines, so that operators above and below can watch each other's movements and signals, and the auxiliary engines can ordinarily be watched from above.

The condensers for the steam turbines are of the jet type, built by Allis-Chalmers Company, each capable of giving the best possible service when its unit is operating at full rated load. Cycloidal air pumps, direct connected to inclosed, self-oiling, high-speed engines, and duplex double-acting circulating pumps are installed with this apparatus, as is also a third condenser to take the exhaust from the remainder of the plant.

The speed of each turbine is regulated within close limits by a governor driven from the shaft through cut gears

working in an oil bath. This governor, by means of a relay, operates a balanced throttle valve. The entire mechanism is so proportioned as to respond at once to variation of load, but its sensitiveness is kept within such bounds as to secure the best results in the parallel operation of the two turbo-generators in this station. The governors can be adjusted for speed while the turbines are running, thereby facilitating the synchronizing of the alternators and dividing the load as may be desired. In order to provide for any possible accidental derangement of the main governing mechanism, there is an entirely separate safety or overspeed governor. This governor is driven directly by the turbine shaft without the intervention of gearing, and is so arranged and adjusted that if the turbine should reach a predetermined speed above that for which the main governor is set, the safety governor will come into action and trip a valve, shutting off the steam and stopping the turbine.

The bearings are of the self-adjusting ball and socket pattern, especially designed for high speed. Shims are provided for proper alignment.



Kokomo Marion & Western—Plan of Power House.

Lubrication.

The lubrication of the four bearings, two for the turbine and two for the generator, is effected by supplying an abundance of oil to the middle of each bearing by means of a small cycloidal pump driven from the turbine shaft and allowing it to flow out at the ends. The oil is passed through a tubular cooler with water circulation and pumped back to the bearings.

It is not necessary to supply the bearings with oil under pressure, but only at a head sufficient to enable it to run to and through the bearings, this head never exceeding a few feet. The oil cooling system is taken care of by two induction motor driven centrifugal pumps, supplied by Thomas & Smith of Chicago and the American Well Works, and the gland water for the turbines is also supplied by two centrifugal pumps purchased from the former company, propelled by direct-current motors, taking their power from the exciter circuits. No oil of any kind is used in the interior of the Allis-Chalmers steam turbines, nor in the glands through which their shafts pass. Low oil alarms have been provided for the turbines.

The hot parts of each turbine, up to the exhaust chamber, are covered with an ample thickness of non-conducting material and lagged with planished steel, so applied that it may be easily removed. The non-conducting covering is also removable at the cylinder joint to facilitate the opening of the turbine for examination.

Coupling.

Between the turbine and its generator a special type of flexible coupling is used to provide for any slight inequality in the wear of the bearings, to permit axial adjustment of the turbine spindle, and to allow for difference in expansion. This coupling is so made that it can be readily disconnected for the removal of the turbine spindle or of the revolving field of the generator. Provision is made for ample lubrication of the adjoining faces of the coupling.

Turbo-Generators.

The revolving field alternators driven by these turbines are of Allis-Chalmers Company's standard type, designed for high efficiency and safe operation at high peripheral speeds. The field core is built up of steel discs, each in one piece, giving high magnetic permeability and great strength. Coils are placed in radial slots, thereby avoiding side pressure on slot insulation and the complex stresses resulting from centrifugal force, which, in these rotors, acts normal to the flat surface of the strip windings. Bronze wedges hold the coils firmly in the slots, making the surface of the rotor a smooth cylinder, reducing windage losses and insuring quiet operation, and the end connections are securely held by chrome-nickel steel rings.

The stator is completely inclosed, eliminating noise of operation. Coils were completely wound and insulated before being placed on the core, thus obviating the risk of defective ventilation. Stator windings are placed in open slots, rendering the coils readily removable. End connections are firmly braced, preventing deformation of coils in case of short-circuit.

For the purpose of obtaining adequate ventilation and for muffling the noise produced by the circulation of air, the turbo-generators are inclosed in such a manner that the air is taken in at the sides through fans mounted on the rotor shaft which discharge it over the end connections of the armature coils into the bottom of the machine, whence it passes through the ventilating ducts of the core to an opening at the top. This system of ventilation is most efficient.

Exciters.

Excitation of the two turbo-generators is accomplished by means of exciters of 35 kilowatts and 30 kilowatts, the former being driven by an Allis-Chalmers induction motor and the latter by an Erie Ball engine. The engine driven generating unit has a 5-kilowatt belted exciter. Turbo-generator

excitation at full load is 120 volts, 160 amperes. The exciters do not take care of the station lighting. Current for this is derived directly from the main busbars or from a storage battery.

Station Load.

As above intimated, the character of the load put upon this station is railway, lighting and power combined. At present there is a normal consumption of current somewhat under the rated capacity of the turbines, so that one can be held constantly in reserve, and this drops to a minimum during the early morning hours of about 300 kilowatts.

A feature to be particularly commended is the thorough keeping of station records and the frequent checking of efficiencies of different parts of the plant. On the company's log sheet the daily load curve is plotted, thereby enabling it to be easily comprehended for the 24 hours at a glance. All costs and station performances are also recorded on the daily log. In addition to this records are kept in the office of the outside distributing circuits and two Wright demand meters are constantly used to check the loads on lighting and power transformers over the town.

Alternating current is generated at two-phase, 2,300 volts, and transformed to three-phase, 11,000 volts, for transmission over the line of the interurban railway. In the main station there are used for this purpose three 150-kilowatt oil-filled self-cooled transformers, Scott connected, and in the substation, 17 miles distant, there are three 150-kilowatt step-down transformers delta connected. These transformers have $1\frac{1}{2}$-inch outlet pipes run directly through the floor, so that in case of fire oil can be emptied into barrels in the basement where the oil supplied is stored.

Direct current for the city railway system and 10 miles of the interurban line is supplied through motor generator sets in the main station, delivering power at an operating pressure of 600 volts, and the substation at Swayzee, 18 miles east of Kokomo, contains three rotary converters for the purpose of transforming the alternating to direct current. One of these, having a capacity of 200 kilowatts, is equipped with an induction starting motor and two of the 75 kilowatts each are started through a storage battery from the direct-current end.

Distribution of Current.

Current from the main generator busbars passes to the outgoing lines through double through switches, ammeters, wattmeters and fuses, all such circuits being also put through integrating wattmeters. Three hundred thousand circular-mil cable is used, with high voltage rubber insulation. The wiring from the generators to the switchboard is open work, fastened to the under side of the engine room floor. The busbar system is in duplicate. Any machine or any feeder can be operated off of any set of buses. The switchboard rests on insulated stringers.

Storage Batteries.

In a separate building, located about 60 feet from the main generating station, is a battery installation supplied by the Electric Storage Battery Company, which has a capacity of 480 ampere-hours and consists of 288 "chloride accumulator" cells. A smaller storage battery, consisting of the same number of cells, but having a capacity of 320 ampere-hours, is installed in the substation at Swayzee. The latter has glass cells and the former are of wood with lead lining. The function of these batteries is to eliminate load fluctuations on the rotaries so that their output will be constant. Regulating boosters are installed in conjunction with each battery, of such design as to automatically regulate the charge and discharge of the battery, causing it to discharge when the load is in excess of the average and charge at times when the load is less than the average.

Alternating current passes from the switchboard busbars through the transformers, as above mentioned, and stick breakers are provided between the high-tension sides of the transformers and the outgoing lines, which are led through high-voltage bushings protected by round glass plates set in tile.

The lines are equipped with Westinghouse low-equivalent arresters and Westinghouse choke coils, to which ready access is had from the gallery. The lighting feeders have G.E. lightning arresters and choke coils built at the station. On the direct-current railway system Garton lightning arresters are used, there being four of these to every mile.

Services.

Kokomo has an exceptionally large number of factories and industrial establishments of various kinds, most of which are located on a belt railway that runs around the city at its border. This insures to the city lines large traffic the year through and in summer it is augmented by pleasure trips made to a beautiful and much visited park which the city maintains on the outskirts of the town. Adjacent to this there is also a well-equipped amusement park owned by the company.

A stone quarry, which was originally owned and operated by the company, in order to provide crushed rock for ballast, but has since passed into the possession of others, is located on the line of the interurban railway; and the larger part of the product of the plant—about 300 cubic yards per day—is transported by the company to the steam roads and out into various parts of the state. All of the machinery of this quarry used in crushing, elevating, etc., as well as of another quarry having similar capacity, is operated by motors run on alternating current taken from the power circuits.

Among other important customers taking power for motors are a brass works and spark coil factory, two machine shops, a large flour mill, an automobile manufactory, bottling works, leather and harness establishment, glass factory, canners, planing mill, cooperage plant, mitten works, lumber yards and nearly all of the smaller factories and shops in Kokomo, representing no less than 84 distinct industries. The use of small single motors and groups of two or three operated for various purposes is also growing throughout the city, so that electric drive has become one of the recognized features of the town. To accomplish this result, which has been brought about within comparatively recent time, T. C. McReynolds, secretary-treasurer and manager, and P. H. Palmer, the company's engineer and lighting superintendent, have made a systematic study of local power requirements and are prepared to give each prospective customer a detailed statement as to just what improvements can be effected in his particular case by the substitution of motor drives in place of power applied through shafting, belting, etc. Furthermore, the company is ready at all times to back up its assertions by satisfactory guarantees and to submit complete engineering plans involved by the proposed change. It is indeed a stubborn proprietor or manager who, seeing certain advantages of electrical operation set forth in black and white and guaranteed by a responsible concern, is not willing to listen to such overtures as the central station people in this city are ready to make.

The company's campaign has, however, not stopped at factories, shops, stores or industrial establishments of any kind; but has been carried into the homes of the city. Electric lighting is now become general and more than one-half of the company's customers have electrical apparatus of one kind or other, including laundry irons, heaters and cooking utensils. If progress made along this line during the next few years is at all commensurate with present indications, it will mean an enormous increase in business and the probability is that more will be done in this direction than the most sanguine would believe, for the results of such work multiply almost in geometric ratio.

G. J. Marott, Indianapolis, is president of the company; T. C. McReynolds, secretary-treasurer and manager; P. H. Palmer, engineer; and H. P. Martzolf, superintendent of trans-

portation. To each of these officials must be given credit for far more than the average enterprise and foresight, and to those actively concerned in the operation of the system for downright hard work. With a management so intensely interested in promoting the welfare of a company success is unavoidable and the best prophecy of the future is the very encouraging testimony of the present.

USEFUL ARMATURE REPAIR SHOP METHODS.

BY NORMAN G. MEADE.

The economical operation of the repair shop and its ability to quickly execute necessary repairs is a subject of importance to every electric railroad. The equipment of tools and labor saving devices and the manner in which the work is systematized are important factors upon which the ultimate economy of the repair work depends.

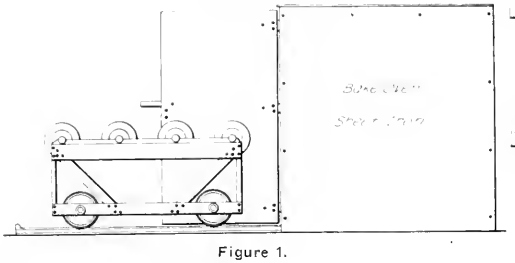


Figure 1.

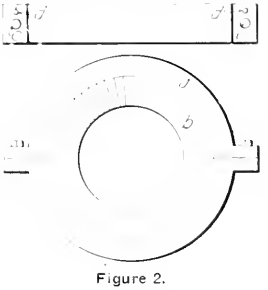

Figure 2.

There are numerous small devices that are inexpensive and add greatly to the quality of the work and uniformity of the product. The shop equipment should include a lathe, shaper or planer, drill press, milling machine with an indexed head, a bake oven for the baking of armatures and field coils, a winding machine and numerous molds for armature and field coils.

Bake Oven.

A very convenient and serviceable oven is shown in Figure 1. It is made of an angle-iron frame covered with sheet-iron lagging and provided with a large door. Steam coils are arranged about the inside for maintaining the requisite temperature. In the figure a track is shown, together with a small car with an angle and channel iron frame and provided with notches for receiving the armature shafts. When commutator or field coils are to be dried a sheet of iron may be laid on the car forming a table. The convenience of such an arrangement will be readily appreciated, as all heavy parts can be easily loaded and unloaded in the open by means of a crane or hoist.

A sloping rack for storing extra armatures is easily made of timber, occupies little space, and permits the armatures to be readily removed when needed.

The commutator is the part of the motor subjected to the greatest wear, therefore the facilities for quickly refilling them and making extras should be at hand. The first operation is loosening the armature leads and removing the old commutator. The segments should be bound tightly with heavy cord and the shell removed, when templates corresponding to the bore of each end should be made. Drop-forged segments for refilling can generally be purchased for the various standard motors. Sheet micanite is desirable for insulation between the segments and pieces can easily be cut out with a pair of snips, using one of the new segments as a pattern.

To assemble the segments stand them upright on a smooth surface, with the insulation in place as shown at b in Figure 2. They should then be clamped firmly by an iron or steel clamp shown at a, one-half being shown in the upper portion of the illustration where c and c' are holes to receive bolts, and d and d' dowel pins. The assembled segments are now ready for boring and may be clamped in the chuck of a lathe and bored at each end to correspond with the templets already prepared.

A device for holding the segments while finishing the outer surfaces is shown in Figure 3. The segments are shown at d and a is an arbor and b and b' are clamping nuts for holding the collars, c and c', in position. The temporary shell should be applied before loosening the outer clamp shown in Figure 2. When in place the assembled segments can be turned and finished. They are then ready for the slots that receive the leads. The milling machine is used for this purpose and the indexed head serves for spacing the slots properly.

The segments should next be carefully lined up as shown in Figure 4, where a is the arbor, b a surface plate, c the segments and d a try square. By sighting along the edge of the blade it is easily determined whether or not each segment is in line. If any one is out of line it should be driven into position by means of a small cold chisel and hammer. The outside clamp should next be applied and the temporary shell removed when the segments are ready for assembling in the original shell.

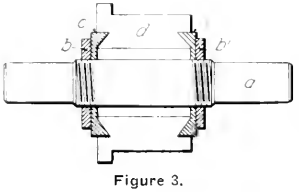

Figure 3.

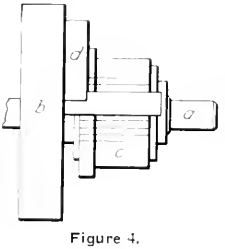

Figure 4.

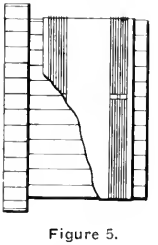

Figure 5.

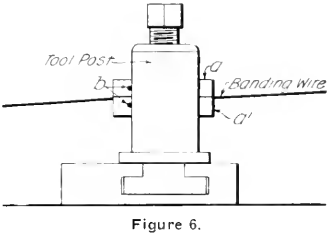

Figure 6.

When removing the worn-out segments from the shell care should be taken to keep the insulating rings at each end intact for future use. After the new segments are assembled in the shell the commutator should be placed in the oven until thoroughly heated and the shell again tightened. The commutator, after a final polishing, is then ready for use. Care should be taken in all the operations to see that no metal chips become embedded in the insulation and before the commutator is used it should be thoroughly tested for grounds or short-circuits.

It is desirable when refilling a commutator to make up

several sets of segments ready for future use. This can be done by placing bands about the segments as shown in Figure 5. The bands consist of brass wire wound tightly and held in place by clips and solder as shown. The bands should be separated from the segments by heavy paper. A convenient arrangement for placing tension on the banding wire is shown in Figure 6. It consists of two pieces of fiber, a and a', with retaining pins, b, held in the tool post of the lathe. Any tension desired can be obtained by means of the clamping screw.

If the slots in the commutator for the armature leads are tinned before using, the soldering operation is much simplified This can be done by applying soldering flux to the slots and immersing the shoulder in melted tin. Figure 7 shows a device, a, for lowering the commutator, b, into the tin, the ring on top being readily attached to a hand hoist.

Armature Coils.

Armature coils, to be successfully made, must be wound on forms and carefully shaped. When tearing apart a burned-out armature at least one of the old coils should be taken out carefully enough to preserve its original shape, so that a sketch can be made and the dimensions taken. Figure 8 shows the essential parts of a form for the first process in the making of coils. The center, a, and one side, b, are shown in plan view, and the opposite side, b', in side elevation. The slots, c, c_1, c_2 and c_3, are to receive pieces of cord for tying the completed coil together, so that it will retain its shape until taped. The holes, d and d', are to receive the bolts, f and f_1; e and e_1 are dowel pins, h is one of two thumb nuts that screw on the bolts, f and f_1, to clamp the parts of the form together. The center, a, is permanently attached to the side, b, so that it can be removed with the coil intact, when it can be easily taken off the form. A boss, g, is bored and threaded to screw on the winding machine shown in Figure 9. The slots in band, b_1, opposite the dowel pin, e, are for the coil ends.

The winding machine is a simple device, consisting of a spindle on which the forms are screwed, the necessary gearing for speed reduction and a pulley for the driving belt. The driving motor can be mounted under the bench and the controller operated by a foot treadle.

A coil is formed in the first operation and partially taped. To shape the coil a device shown in Figure 10 is used consisting of a wood base, a, to which grooved wood strips, b, are attached. The upper sketch shows a cross section of the form. One side of the coil is slipped into one groove and the other pulled over and slipped into the opposite groove, as shown. The ends are easily straightened with a mallet.

Figure 11 illustrates a soldering appliance for soldering the leads in the commutator. The apparatus is shown in section and the armature complete with a clamp on the shaft for lifting. A circular metal bowl mounted on legs forms the solder pot. The melted solder should be kept up to the level of the dotted line, a. A circular gas burner is shown below the pot. The armature is placed in the position shown, resting on the commutator shoulder, and the level of the solder raised by inserting a piece of heated metal, such as iron or steel. Any size of commutator can be soldered by using a bushing slipped over it, which will rest on the bowl.

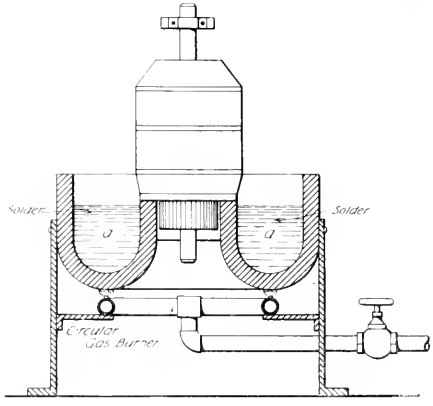

Figure 11.

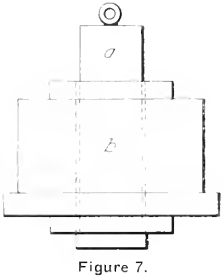

Figure 7.

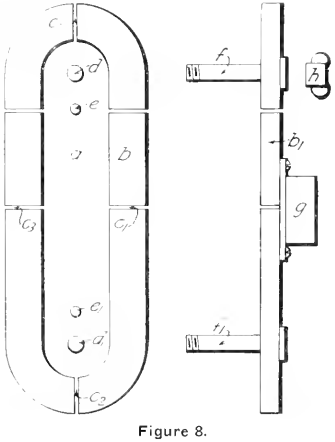

Figure 8.

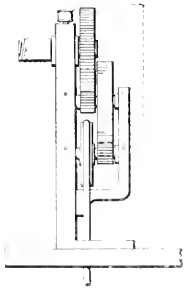

Figure 9.

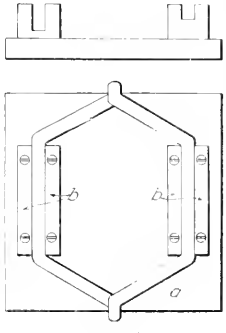

Figure 10.

Recent press reports have related that an electric truck is in operation about the shops of the Union Pacific Railroad at Omaha, Neb., the energy which operates it being transmitted wirelessly from a central station in the middle of the grounds. This report is incorrect in its essential features, though an interesting innovation is indeed being worked out. W. R. McKeen, Jr., superintendent of motive power of the Union Pacific at Omaha, advises us that a storage battery truck is in use in the Omaha shop yard. For experimental purposes this truck has been equipped with necessary receiving wires and wireless waves have been used in connection with a wireless telegraph coherer for making and breaking the circuit between the batteries and the motor on the car, thus starting and stopping the car. This system, while not wireless transmission of energy in the popular sense, should involve some very nice apparatus; and this, the reports state, is being worked out by Dr. Frederick H. Millener, working under the direction of Mr. McKeen.—Railway and Engineering Review.

SHORT TALKS WITH THE CLAIM INVESTIGATOR—IV.

BY F. W. JOHNSON, ASSISTANT GENERAL CLAIM AGENT PHILADELPHIA RAPID TRANSIT COMPANY.

A working knowledge of the principles of the law of negligence is of the utmost importance to the investigator who is desirous of some day standing at the head of his own department. Its value to him cannot be overestimated.

Many young men in claim work seem to labor under the impression that they have, for the time being, reached the limit of their development in the work of the department when they have become proficient in the securing of statements and of releases. Having reached this stage, they let up somewhat in aggressiveness and resign themselves to waiting patiently for promotion.

Necessity for Study.

Right here is where they are misled. Having successfully negotiated the first steps in accident work, instead of waiting for good luck, they should immediately reload their guns and follow the trail for even larger game. Vacancies higher up are bound to occur sooner or later; if not in one company then in another. When that opening does come, the man who has had the foresight to prepare himself in advance for added responsibilities stands in a class by himself, for he has stolen a march upon many another man just as capable as himself, but who lacked his foresight.

To the investigator who is desirous of broadening his knowledge of claim work the suggestion is herewith advanced that he take the matter up direct with the head of his department, explaining to him his wishes in this direction and asking for his advice and assistance. He will find his chief only too willing to aid him in every way within his power.

A systematic course of work, devoting say one hour a day to study, will prove of incalculable assistance to the investigator in his daily work, and in time will give him an insight into the principles of the law of negligence, particularly of his own state, that will qualify him for broader fields of action. With the possession of this knowledge comes promotion, and with promotion comes the ever welcome increase in salary.

Knowledge of Medical Terms.

Having branched out in the right direction, go one step further and acquire as well a working knowledge of the medical and surgical terms commonly met with in this work. Here again can the head of the department render valuable aid in offering suggestions concerning the course of study. It is not essential that a man should attempt to qualify himself as a full-fledged expert; the idea rather is to gain sufficient knowledge to enable one to intelligently understand the reports submitted by the company's examining surgeons, and to accurately judge of the severity of an injury, and of the probabilities of the future.

The ability to recognize defects, wherever they may exist, and to advance suggestions of a remedial character, is another feature of claim work the possibilities of which are too little appreciated by the average investigator.

It doubtless is true that investigators sometimes hesitate to advance suggestions of this nature for fear of offending or of incurring the displeasure of the head of the department. There should be absolutely no grounds for such a feeling, for if a man has any breadth of view at all he cannot but recognize the value of suggestions of just this character.

Value of Offering Suggestions.

A man doesn't have to go four or five hundred miles from home in search of defects. The condition of the company's rolling stock, roadbed and overhead construction, the daily work of the men upon the cars, the advantages of safety appliances in connection with the operation of cars, the methods followed by the department in its routine work, the organization of the office force, and the blanks and forms in use in the department—all of these and countless other matters furnish abundant opportunity for constant improvement, if only a man is sharp enough to recognize defects.

An illustration of this very point may be cited in the custom followed at the immense plant of the National Cash Register Company at Dayton, O. Here every inducement is offered the company's employes to advance suggestions of this very character. A recording device, designed expressly for this purpose, is placed in each of the many departments. Upon these suggestions are noted by the employes, one copy going to the company, the other being detached and retained by the employe.

Upon the occasion of a recent visit to the plant the visitors were informed that countless suggestions of a very valuable character had been advanced by the employes in this way. Due acknowledgment is given by the company of suggestions so received, and it has been found that the interest and enthusiasm of the several thousand employes of the company have been stimulated by their efforts to improve always upon the methods in operation. One interesting instance was cited wherein the desire of an employe to better conditions in his department resulted in a discovery of considerable moment to both the employe and the company. It appeared that the company used a roll of paper, supposed to be of a certain specified length, in connection with the output of one of its departments. The employe in question decided to measure these rolls one day, in order to verify the measurement. To his astonishment he found that they averaged from 20 to 30 yards in excess of the supposed length. This discovery naturally resulted in a considerable saving to his employers in the course of a year.

The opportunities for offering suggestions of this character are just as great in claim work as in any other line of business. A man should not require a special invitation to give to his chief whatever suggestions occur to him along this line. In claim work suggestions should always be put in writing, addressed to the head of the department, and should represent the best thought of the writer upon the subject referred to, as opposed to hasty conclusions formed upon the impulse of the moment.

Personal Appearance.

The matter of personal appearance likewise is a subject which should not be entirely overlooked by the claim man of the present day. First impressions are said to be lasting ones, and in his line of business it is of considerable importance that the first impression formed of him by claimants and witnesses should be as favorable to him as possible. By this it should not be inferred that he must be expensively clothed, or that he should possess the manners of a dancing master, in order to create a favorable impression.

It is simply a question of neatness and of good taste. An occasional pressing of the business suit, shoes blackened daily, face clean shaven, clean linen and a becoming scarf, carefully tied, all cost but little, yet go far toward imparting a wholesome, well-groomed appearance to a man. It is just a question of whether you prefer to appear as a clean-cut, successful young business man or as a recent arrival from the backwoods district.

In conclusion, bear ever in mind the value, from a business point of view, of a good, clean record. If you have any such thought, disillusionize your mind of the belief that trickery, fraud or questionable tactics have any place in claim work. Remember that an advantage gained through fraudulent means can be but temporary in character and of no actual benefit to your company or to yourself.

Endeavor at all times to act fairly and honorably toward your employer, toward your witnesses and claimants, and toward yourself.

You will find it a winning combination that will leave no bad taste in the mouth.

A REVIEW OF THE PRESENT PRACTICE AND ECONOMICS OF TIMBER PRESERVATION.*

BY EUGENE P. SCHOCH, UNIVERSITY OF TEXAS.

The increased price of timber has led many users of wood to inquire carefully into the subject of timber preservation. The railroads have carried on a systematic and painstaking investigation for a number of years and the United States government, through the department of agriculture, more particularly the bureau of forestry, has studied the subject in a way that has supplemented and augmented the information gathered by our railroads and European governments so as to bring it down to a point where answers to the question, "Does it pay?" can definitely be given.

The problem before us in its simplest terms amounts to this: "Is wood preserving profitable?" This is not a simple problem to solve. So many factors enter into the final calculation of the cost that one general answer cannot be given. Granted that a wood preserver is certain to lengthen the life of a tie, the question becomes: How much may we spend for a preservative in order to gain a certain increase of life? Evidently the preservative which would lengthen the life of the tie to the greatest extent is not necessarily the most economic preservative to use, because it is possible that the extra cost of the best preservative over some cheaper, but less effective, article or method is not balanced by the extra length of life of the tie. In this calculation must be included the calculation for the relaying of the tie, which would seem to give the advantage again to the preservative that insured the greatest gain in the life of the tie. On the other hand, however, we may be confronted with the difficulty that the tie may be destroyed through mechanical wear or influence other than decay before the expiration of its assumed life, and for this reason a cheaper method again may be preferable. And so one consideration after the other must be duly weighed before a final answer can be given.

Causes of Decay.

The causes of decay are bacteria and fungi which attack the fibers of the wood. For a detailed description of the action of these fungi in their attack upon wood fiber see Bulletin No. 10, division of forestry, "Timber: An Elementary Discussion of the Characteristics and Properties of Wood," and Bulletin No. 14 of the bureau of plant industry, "The Decay of Timber and Methods of Preventing It." (These two and all other United States government bulletins referred to in this paper are published by the department of agriculture.)

These fungi and bacteria grow best when they have an abundant supply of food and certain conditions of heat, moisture and air. In the absence of one of these growth is inhibited. The efforts in timber preservation should be directed as much toward prevention of the best conditions for the growth of the fungi and bacteria as it should be directed toward poisoning these organisms. Thus, green timber, containing in its sap an ample supply of readily assimilated food, as well as a proper amount of moisture, presents in that state splendid conditions for the development of bacteria and fungi, whereas well-seasoned wood presents unfavorable conditions—the sap has dried out and the fibers and remaining portions are not in a form in which they are as readily assimilated for food as they were before the sap was dry. Also the absence of moisture retards the growth of bacteria and fungi. Hence, wood may be said to be extensively preserved by proper seasoning.

The advisability of seasoning rests not only upon this point, but furthermore upon the fact that preservative liquids cannot be injected into the wood unless the space occupied by the sap had been previously made vacant by the removal of the latter. Furthermore, the preservative liquids in general penetrate only a part of the wood, and if in the parts not reached the conditions for the development of fungi and bacteria are suitable, decay will set in there and continue, although the outer portions may be completely preserved. The baneful effects of preservative treatment without preliminary seasoning of some sort or other are well known to all practical wood preservers, and as the result of general experience it may be said that the most essential first step in the preservation of timber is proper seasoning.

Seasoning Timber.

Seasoning is attained in different ways. Of course, the commonest is air drying—read in this connection Bulletin No. 41, bureau of forestry, "Seasoning of Timber." It is remarkable what results can be attained when by proper stacking timber is given a chance to season. Even three months' seasoning is very beneficial. In many cases over three-fourths of the moisture in green timber is evaporated during the first four weeks. Four months' summer seasoning is adequate for wood used for many purposes, notably for ties and posts. The main thing that is necessary for this purpose is a proper stacking of the timbers, and attention to this detail cannot be urged too much. In suitable localities satisfactory seasoning may be practiced without requiring therefor an amount of time that would seem to make it impracticable.

Artificial seasoning becomes necessary when the local conditions do not admit of air seasoning or when time does not permit. The method of kiln drying may then be practiced, though naturally more particularly by the lumber dealers rather than the timber users. The large wood preserving plants which have cylinders for pressure treatment are using a system of steam pressure seasoning, which is very effective, but it is only used in connection with pressure preservative treatments.

Preservatives.

If through proper seasoning the interior of the timber has been rendered practically free of conditions for the development of bacteria and fungi, all future attack becomes possible only through the entrance of moisture from without. If, then, the moisture entering the wood is thoroughly saturated with poisonous substances which inhibit the growth of bacteria and fungi, decay is effectively prevented. This is the basal idea of the preservative treatment. Many substances have been used an antiseptics for this purpose. At present there are four distinct kinds of substances used as wood preservers. First of all, coal tar distillates—creosote; second, poisonous salts of metals—zinc chloride, corrosive sublimate; third, crude oil; and fourth, wood tar distillates. These substances are far from being equally successful. They are mentioned here merely as the substances that are actually thought of today as possible preservatives. In some processes combinations of several of these substances are used. The American Railway Engineering and Maintenance of Way Association, in the proceedings of the fifth annual convention, page 68, states that the following processes have stood the test of time: Creosoting, zinc chloride with creosote, zinc chloride alone and zinc chloride with glue and tannin. The latter are added merely to fix the zinc chloride in the wood and prevent its being washed out. Corrosive sublimate also has been used and has proven itself very efficient, but its extremely poisonous effect upon high organisms makes it an objectionable substance. These substances are essentially antiseptics; that is, water that has come in contact with these substances inhibits the growth of bacteria and fungi.

The third class of substances, mineral oil or crude oil, has recently been thought of as a wood preserver, and a few experimental trials have been made. A record of results published by the American Railway Engineering and Maintenance of Way Association, volume 8, page 471, shows that crude oil does not effectively preserve wood except when used in sufficiently large quantities to exclude moisture from the wood. It is not a germicide.

The fourth class of wood preserving substances, distillates of wood tar, might be expected to be just as efficient as distillates of coal tar. Such is far from being the case. They have been offered to the public for many years, but they do not appear to have come into any extended use.

Of the substances that are admittedly good wood preservatives the tar oil distillates hold the highest rank. The mixture of tar oils known as creosote has been used as a preservative for such a great length of time that there is now no question as to its efficiency. However, it is a very complex substance and the question arises, "Are all of these components of equal value for purposes of wood preserving or are some of lesser and others of greater value?" An answer to this question was sought by means of analyzing timber that had successfully withstood decay for a long number of years, to determine which ingredients of the original creosote remained in the wood to preserve it. Such investigations were carried out by Charles Coisne in 1862 for the Belgian government; again in 1882 by S. B. Boulton for the London & Northwestern Railway; recently again by Gellert Alleman for the United States department of agriculture, and by Von Schrenk, Fulks & Kammerer. The observations and conclusions of all these investigators agree in the following: (1) That the tar acids, such as carbolic acid, which formerly were considered to be the most valuable constituents of creosote, are soon lost, either washed out or evaporated from the wood, and hence do not serve permanently to preserve the wood. (2) Naphthalene and the low boiling oils are markedly evaporated from the wood during the early years of exposure. (3) The high boiling tar oils, notably the portions boiling from 270 degrees and upwards, are the substances that permanently remain in the wood. All investigators agree in pronouncing these high boiling oils the most valuable portions of creosote.

*Abstract of paper read before the Southwestern Electrical and Gas Association at El Paso, Tex., May 7, 8 and 9, 1908.

For references in this connection see the "Preservation of Timber," by S. B. Boulton, published by D. Van Nostrand Company, New York; Circular 98 of the forest service, "Quantity and Character of Creosote in Well-Preserved Timbers," by Gellert Alleman; and reprint from Bulletin 93, American Railway Engineering and Maintenance of Way Association, "Changes Which Take Place in Coal Tar Creosote During Exposure," by Von Schrenk, Fulks & Kammerer.

The following approximations may be of interest here: Creosote as found in the market contains from 15 to 30 per cent of the high boiling oils. Also 30 to 60 per cent of the oil is lost by evaporation during the first 8 or 10 years of exposure, the loss being confined to the low boiling constituents, including naphthalene. For the most up-to-date detailed discussion on the grading of creosotes see Forest Service Circular No. 112, "The Analysis and Grading of Creosote," which has just been issued.

Action of Preservatives.

Opinions differ somewhat with regard to the theory of the action of these preservatives. Of course, all have agreed that the preservatives must be germicides, and hence that their action is to poison, or at least inhibit the growth of, bacteria and fungi by their mere presence. With such substances as zinc chloride or corrosive sublimate the mode of action is simple enough: The germicides dissolve in the moisture that enters the wood, forming a solution of the proper germicidal value. Wherever such moisture may penetrate bacteria and fungi cannot live. While this action is the only one possible with zinc chloride or corrosive sublimate, there is an additional one possible with oil such as creosote, namely, the utter exclusion of moisture.

If moisture is effectively excluded bacteria and fungi cannot grow, and hence it is not surprising to hear of the results recently reported by Mr. Faulkner of the Atchison Topeka & Santa Fe Railroad (see Volume 8, American Railway Engineering and Maintenance of Way Association, page 473). Fourteen ties were treated with California crude oil, the ties taking up from 4 to 8 gallons of the oil apiece. Crude oil has no germicidal power whatever, yet these ties laid in the experimental track on the Beaumont division of the Santa Fe, near Pelican, in 1902, are still in good condition. Of course, we must remember that from 4 to 8 gallons of oil per tie is a large amount and must close effectively all pores and openings so that moisture cannot possibly enter. Merely coating the surface of wood with what might be assumed to be an impervious coat is ineffective. This is shown by the comparative inefficiency of a coat of hot tar applied to timber, a procedure which, though known to be inefficient, yet is resorted to frequently by engineers and others who should know better. Recent experiments at the Wyoming experimental station (see Bulletin 75, Wyoming experimental station) show that posts that had been dipped in hot crude oil or in hot tar lasted slightly longer than untreated posts, but the tar did not protect as well as the crude oil. Yet, even soaking for 24 hours in crude oil is not economically efficient, as has been pointed out elsewhere above. While it is probable that in piles creosoted for marine exposure in which 20 or more pounds of creosote per cubic foot are injected, the action of the oil tending to exclude water does as much to preserve the wood as is due to its germicidal power, yet with creosoting for land exposure, by the Rueping process, in which not exceeding five pounds per cubic foot are left in the wood, the action is mainly or entirely germicidal. It must be remembered that in all these cases of creosoting for land exposure large central portions of posts and ties receive really no oil and yet decay does not set up in these portions, unless the surface is removed, exposing large portions of untreated wood, in which case decay will readily set in at these exposed places.

These facts lead to the conclusion that in most cases the detail of the preservative action is as follows: Moisture may enter through the layers containing the creosote, in a sense filtering through these portions, and saturate itself with the oil. The moisture is then strongly germicidal, a fact that has been ascertained by direct laboratory experiment by shaking up water with creosote oils. This moisture in its passage to inner untreated portions of the wood prevents decay. While moisture may actually enter the wood during wet seasons, it may just as readily pass out again, because the outer layer of the oil does not prevent evaporation, thus leaving room for other portions of moisture introducing in turn more of the preservative. Any slight quantity of moisture which may probably be present when the wood is treated may thus evaporate after treatment, and at some time or other be replaced by other moisture which contains the germicide. It is readily seen that with a layer of tar this action will not effectively take place. Moisture may enter through cracks in the tar, which cracks will be certain to occur, and hence the entrance of moisture cannot be prevented, yet such moisture has little or no chance to absorb any of the tar. The evaporation of moisture, on the other hand, is effectively hindered because the surface in general is closed by the tar, and hence, under some conditions, an impervious coating of paint or tar may actually hasten decay.

The germicidal power of high boiling tar oils has scarcely been stressed enough so far. The quantity of oil which will dissolve in water, it is true, is exceedingly small, and hence the amount of the oil used up in the course of time is practically negligible, yet that small amount renders the water absolutely germicidal to a degree only attained by a comparatively large concentration of zinc or mercury salts.

We have, then, as the first important property of preservatives their germicidal power. Next to this comes their lasting power. Reference has already been made to the fact that portions of creosote, such as the tar acids, carbolic acid, naphthalene and, in general, all oils boiling below 270 degrees, are either so readily volatilized, or are so readily dissolved in water, that they gradually disappear from the wood, hence it is primarily the high boiling oils which give creosote its value as a wood preserver, because besides being highly germicidal they are quite permanent. Zinc and mercury salts have their greatest defect in their solubility, on account of which they are readily washed out of the wood, particularly in wet localities.

Wood Preservers.

Besides the preservative substances above discussed there are on the market many of what may be called proprietary wood preservers. As far as I know none of them contains ingredients essentially different from those mentioned above. Of course, several of these substances may be variously combined. Depending upon the quality and the relative amounts of the ingredients these proprietary wood preservers may or may not be worth their price. Although the ultimate test of any wood preservative is the practical result it produces, yet chemical analyses properly interpreted by experienced parties, in my opinion, may be relied upon in judging the value of an article approximately justly. Hence, I would advise parties who contemplate the purchase of a wood preserver to ascertain the composition of the substance, and then judge its value with reference to the points discussed above, namely, its germicidal value and its power to resist atmospheric influences, considering in connection the amounts to be injected per cubic foot or per square foot surface.

It might be pointed out here that a wood preserver should not form an outer coating, but should soak into the outer layers of the timber. The statements made with reference to the efficacy of the four classes of substances previously discussed may serve as a basis for judging the value of the proprietary composition. Much valuable advice may be obtained in this connection from the United States forest service. The value of a certain brand lies mainly in the assurance it gives of furnishing uniformly the article it claims to furnish, and if everything else is favorable this assurance has a considerable market value.

It is unfortunate that the life of timber in its natural state and as treated by different preservatives cannot be definitely given, because so many factors enter into the determination of its life. There is first of all the kind of wood, then the season in which it is cut, the extent of seasoning or drying, and all the other special points which have been called the "idiosyncracies" of timber. Above all, the local climatic conditions determine the life of timber, so that it becomes almost impossible to make definite statements regarding the life of untreated timber, or of timber treated with different preservatives. However, if we bar unusually favorable or unfavorable local climatic conditions, and remember that individual pieces of timber may show results differing considerably from the averages, then the following few statements based on a large number of observations may be ventured. Life of white oak and cedar ties, untreated, 10 years; inferior woods, such as tamarack, loblolly pine, etc., 4 to 5 years. Inferior wood ties treated as follows: Burnettizing, 12 years; creosoting, very light treatment, about 4 to 5 pounds per cubic foot, 16 years; 12 pounds creosoting, 20 years; 18 or more pounds creosote, 25 to 30 years. In addition the following, found by the railroads of the United States, may be considered as particularly reliable: Pine ties treated with zinc chloride, east of the Mississippi, 10⅔ years, west of the Mississippi, 11⅔ years; treated with creosote, even with light treatment, the life is greater than with zinc chloride. Reference has already been made to the fact that wood tar distillates and crude oil used in moderate quantities have not increased the life of timber to a satisfactory degree.

Quantity and Cost.

Considering next the quantity of preservative used and the cost of the operation, I may offer the following as general averages obtained in the operation of the large "pressure"

plants and as actual cost conditions, to which a reasonable amount of profit must be added before a commercial price can be arrived at. Cost of Burnettizing, 5 cents per cubic foot, or 15 cents per tie of 3 cubic feet. Cost of Wellhouse zinc tannin process, 6 cents per cubic foot, or 18 cents per tie. Cost of the zinc chloride-creosote process, 9 cents per cubic foot, or 27 cents per tie. Creosoting, light treatment, enough for 16 years life, 10 cents per cubic foot, or 30 cents per tie. Twelve pounds creosote, 18 cents per cubic foot, or 55 cents per tie. Heavy treatment, enough for 30 years, 28 cents per cubic foot, or 85 cents per tie. The operating cost of large pressure plants is from 5 to 8 cents per cubic foot of timber. The efficiency of the pressure treatment using a sufficient quantity of a good creosote is beyond question and needs no further comment. In some cases, for instance piles for marine exposure, nothing else will answer. It appears to be the conclusion of the railroads that pressure treatment is the most efficient. Doubtless this is partly due to the fact that they own and operate their own plants and operate on a large scale. The high price of creosote led the railroads to try zinc chloride extensively. The substance is comparatively readily washed out of the wood, so that its use in moist regions is inadvisable. In dry regions it appeared to be serviceable, particularly because the ties are destroyed by wear and tear in about 10 years, and zinc chloride is able to prevent decay for this length of time. Since the introduction of tieplates and of the Rueping process, which uses only small quantities of creosote, the tendency is to abandon zinc chloride treatment. I should add here that the use of zinc chloride for poles gives little promise of success, because the salt is so readily washed out.

Purchasers of treated timber are confronted with the same difficulties in a sense that they are confronted with in buying a commercial brand of wood preserver. In the first place, the word "treated" is entirely too vague—the details of treatment must be specified. In good pressure treatment the following amounts are injected: Zinc chloride, from ¼ to 1 pound per cubic foot of timber; creosote, from 5 to 15 pounds per cubic foot (the latter is the maximum that should be asked for for land exposure). The zinc-creosote process treats first with 12 pounds of 2 per cent zinc chloride solution per cubic foot, then allows the timber to dry for 10 days, and subsequently injects 3 pounds of creosote per cubic foot. With the stipulation of the amount of injection should go the specification for the kind of creosote.

The railroads have come to the conclusion that it is profitable to use the best creosote only. Their standard specification for coal tar creosote runs as follows:

Specific gravity at 38 degrees C., 1.03; no distillate below 200 degrees C.; up to 210 degrees not more than 5 per cent; up to 235 degrees not more than 25 per cent; residue beyond 355 degrees, if it exceeds 5 per cent in quantity, must be soft

Purchasers should insist on being furnished with the statement of the tests on the creosote with which the wood is said to be treated. But even with all the specific statements as to quantity and quality of the creosote which has been injected, fraud is possible and has been practiced. Professor Alleman of the United States forest service states that of 12 specimens cut from a consignment of piling guaranteed to contain 16 pounds of oil to the cubic foot of timber, some contained less than 3 pounds and none over 7 pounds. The writer has examined many samples of creosote in the market, and has met some samples which would be little better than crude oil or wood tar distillates—they are nothing but low boiling oils with tar dissolved or suspended in them. The purchaser should take sample borings from the shipment and have them analyzed by a competent chemist to determine the quantity and quality of the creosote or zinc present.

Application.

The open-tank method for the treatment of timber, which was developed recently by the United States forest service, has so far not been in practical use, and hence it is diffieult to say whether or no it will be economically efficient. We pass then to the consideration of wood preserving by so-called superficial applications. These methods are usually not considered by the large users of wood which can use pressure treatment, because at first sight they seem to give little hope for success. Yet the unprejudiced observer must admit that the proper substances "superficially" applied add greatly to the life of timber.

During former years, when less was known about the causes of decay, absolute penetration was thought to be positively necessary to preserve the wood. Since absolute penetration was not always attainable, and the inner untreated portions of the wood remained intact, the views as to the necessity of complete penetration were gradually abandoned. The treatments, particularly with creosote on account of its high price, became lighter and lighter. Yet, under these conditions, very few instances of absolute failure of creosote preserving have been cited. The penetration attained with pressure differs only in degree from that attainable without pressure. The question how little penetration will prove itself economically successful has not been experimented upon sufficiently to give a definite answer. Referring to the explanation for the mode of action of the preservative given above, it appears to be necessary that the treated layer of wood be so thick that any moisture passing into the wood during wet seasons may take up enough of the germicide to inhibit the growth of fungi. Naturally, the thickness of this layer should bear some proportion to the thickness of the timber. All things being equal, the deeper the penetration, the greater would be the protection. If the timber checks to a great extent openings may be made into the untreated portions and decay may enter there. This, of course, may happen even with creosoted timber. In this connection it may be mentioned that whenever creosoted timbers have to be cut so that untreated surfaces are exposed the workmen are directed to paint them with creosote, a procedure which all users of creosoted timbers have found very beneficial.

A preservative which is placed close to the outer surface of the wood is exposed more rigorously to wind and water and hence must withstand solution or evaporation to a remarkable extent. Thus material for superficial application will probably be more expensive; but the lesser cost of the application may counterbalance the additional cost. This procedure of superficial application has been in use for many years, but not until very recently have comparative tests been instituted to determine the comparative efficiency of different materials applied by dipping and brushing. (See United States Forest Service Circulars 104, 111 and 136 and Year Book of Department of Agriculture, 1905, page 455.) Hence we are not able to say anything with reference to the comparative economic value of superficial treatments and deep penetration treatments. I cannot refrain from referring again to the fact that either of these properly done differs only in degree from the other. On page 11, United States Forest Service Circular 111, we find the statement: "For small individual operators who cannot afford the cost of a large plant brush treatments are feasible and economical."

A few figures of cost for labor for superficial application may not be out of place here. From figures obtained by the United States forest service it is seen that the cost of painting the butts of poles for the length of six feet with as much of the preservative as the wood would absorb with two coats, the cost per pole is about 8 cents for labor. (See United States Forest Service Circular 136, page 18.) Cedar, chestnut and arbor vitæ poles during this treatment will take up about 2½ to 3 pounds of tar oils per pole for 20 square feet surface. Ties may be dipped into a preservative liquid and allowed to remain there for a sufficient length of time to absorb from 2 to 6 pounds per tie at a cost of 3 to 5 cents per tie for labor.

Returning now to the question, "Does it pay?" I feel that I cannot do better than to quote two estimates furnished by the forest service, adding, however, that the estimates are exceedingly conservative, and could safely be made much more striking. A hemlock tie as furnished and laid in the track cost 75 cents. Its treatment in the railroad's own plant cost 12 cents. Using the formula,

$r = R\,[(1.0\,p)^n \times 0.0\,p] \div [(1.0\,p)^n - 1]$, in which r is the annual charge, R the initial expenditure, p the rate of interest and n the years of the recurring period, we find that the annual charge on the untreated tie with the assumed life of five years and interest at 4 per cent gives us 16.8 cents. For the treated tie, if it lasts only one year additional, the annual charge is 16.6 cents. This shows that the added life of a single year pays for the cost of treatment. Since zinc chloride treatment adds five years at least to the life of the tie, and since the annual charge for 10 years' time is 10.7 cents, we see that the treatment secures even a saving of 36.3 per cent on the annual charge.

The following is quoted from United States Forest Service Circular 136, page 20:

"Assuming the life of an untreated pole to be 12 years, its cost $9.00 set in the line, the rate of interest on the investment at 6 per cent and the cost of the carbolineum brush treatment 15 cents, it is found that the treatment will have to add about one year to the life of the pole to pay for itself. The forest service considers that the treatment will add at least three years to the life of the pole. Even with these figures, which are high for the quantity and cost of material used, and extremely low for the added life, the treatment makes 200 per cent profit on its cost."

In conclusion I may safely say that the question "Does it pay?" has received such a positive affirmative answer that the real question confronting every timber user is: Which treatment is the most economical? This is a problem that every man must figure out for himself as given in the preceding examples. It is safe to say that future market conditions will add largely to the calculated profit.

PRODUCER GAS FOR ENGINE USE: ITS MANUFACTURE AND CHARACTERISTICS.*

BY W. B. TUTTLE, VICE-PRESIDENT AND GENERAL MANAGER SAN ANTONIO GAS & ELECTRIC COMPANY.

It is not my intention to go into the details of gas engine operation, except in so far as it is necessary to deal with the action of producer gas in gas engines. This paper is intended mainly to deal with gas producers.

Almost all gas producers follow the same general form. There is first a generator. This is usually a round shell, lined with fire brick, and provided with a grate near the bottom and a charging door at the top. To the generator is usually connected an economizer. The economizer is frequently in the form of a small boiler with tubes connected to the flue leading from the generator. The scrubber, usually connected to the economizer, is an iron shell, which is filled with checker work of coke or some other substance over which water is sprayed. To the scrubber is usually connected a tar extractor. This may be either a rotary tar extractor or one of the P & A type. In the latter type the gases pass through holes in a plate, and impinge on the surface of another plate. Again, simply a box filled with shavings may be used. Some producers also have a purifying box in which oxide of iron is used to remove the sulphur from the gas. This, however, is not common.

There are various modifications of the generator part of the producer. Different styles of shaking grates have been used, and in some cases down draft is used instead of an up draft. There are two general types of producers in use: (1) Positive pressure producers, (2) suction producers.

The positive pressure producer receives its air supply from a blower; usually either a centrifugal blower or a Koerting steam blower. The producer works under pressure all the time, and the gas, after leaving the tar extractor, is conveyed to a small holder or gas tank, from which it is supplied to the engine. The suction producer, as its name implies, is not under pressure at any time, and this producer is connected direct to an engine without an intervening holder, and the air necessary for combustion is drawn into the producer by the suction of the engine.

Method of Operation.

In either type of producer the method of operating is about as follows: The generator is filled with fuel in some form, either coke or coal, and when this fuel has been ignited air is supplied to the fuel bed, usually from below. This air passes into the incandescent fuel bed, and combustion immediately takes place. Most of the air unites with the carbon from the fuel and burns to carbon dioxide, so that at the top of the zone of combustion almost all the air has been formed into carbon dioxide and nitrogen. The fuel bed, however, is deep and the carbon dioxide and nitrogen have to pass through additional incandescent fuel. In this passage the carbon dioxide is converted into carbon monoxide, the nitrogen remaining unchanged, so that we have emerging from the top of the fuel bed a gas composed of carbon monoxide and nitrogen. This is the theoretical result if air only is used, and if all the carbon dioxide is converted into carbon monoxide in the fuel bed. As a matter of fact, however, in most producers the fuel bed becomes so hot that the ash and fuel form clinkers, unless some means is taken to prevent it. Most producers are therefore arranged so that steam generated in the economizer can be introduced into the fuel bed along with the air. This steam helps to keep the fuel bed below the temperature at which clinkers form readily, but the steam in passing through the fuel is decomposed and carbon monoxide and hydrogen are both formed, together with some carbon dioxide.

As will be explained further on, the formation of hydrogen has an important effect on the operation of an engine running on producer gas. The fuel itself contains more or less moisture, and this also adds to some extent to the formation of hydrogen. Besides this, particularly where bituminous and lignite coals are used, there is a certain amount of volatile matter driven off of the fuel, and a part of it passes over in the gas in the form of methane, while some is condensed out as the gas is cooled in the form of tar. This tar has been one of the serious obstacles which has confronted those that have attempted to use lignite or bituminous coals for producer gas, but it may, however, be satisfactorily extracted by passing the gas through a tar extractor.

Fuel.

Almost all kinds of coal can be successfully used in gas producers. The following results taken from a report of the testing plant of the United States geological survey would indicate the relative values of Illinois and Indian Territory coals and Texas lignite:

Analysis of Fuel.

	Illinois	Indian Territory.	Texas
Moisture (per cent)	12.43	5.00	33.50
Volatile matter (per cent)	32.65	36.51	32.31
Fixed carbon (per cent)	45.70	49.98	23.80
Ash (per cent)	9.22	8.51	10.36
Sulphur (per cent)	1.11	1.43	0.63

Analysis of Gas by Volume.

	Illinois.	Indian Territory.	Texas
Carbon dioxide (per cent)	9.72	8.25	11.10
Oxygen (per cent)	0.12	0.11	0.22
Carbon monoxide (per cent)	15.12	19.39	14.43
Hydrogen (per cent)	9.98	7.69	10.54
Methane (per cent)	6.00	4.92	7.48
Nitrogen (per cent)	59.06	59.65	56.22

Coal Consumed in Producer.

Pounds per hp. per hour per e. hp. at switchboard—	Illinois	Indian Territory.	Texas
Coal as fired	1.56	1.77	2.98
Coal, dry	1.55	1.69	1.99
Combustible	1.38	1.53	1.68
Pounds per hp. per hour per b. hp. at engine—			
Coal as fired	1.50	1.50	2.54
Coal, dry	1.31	1.43	1.69
Combustible	1.17	1.30	1.43

Gas Produced.

Cubic feet, standard, per pound consumed in producer—	Illinois.	Indian Territory.	Texas
Coal as fired	51.1	51.6	28.4
Coal, dry	58.4	54.1	42.7
Combustible	65.3	59.4	50.6
British thermal units per cubic foot of gas	151	159	169

These figures show that Texas lignite can be used to advantage in gas producers.

The Effect of Hydrogen.

In the operation of gas engines using producer gas it is extremely desirable to keep the amount of hydrogen at a minimum. This can readily be accomplished where a positive blower producer is used; the steam can be added just in sufficient proportion to take care of the fuel bed, thus keeping the amount of hydrogen at a minimum. In the suction type of producer, where the load varies, it is extremely difficult to prevent having an excess of hydrogen in the gas at times, and much of the trouble that has been experienced in the operation of small gas engines equipped with suction producers comes from this source.

Hydrogen and carbon monoxide both have approximately the same calorific value—about 320 British thermal units per cubic foot. Carbon monoxide, however, when it burns, forms carbon dioxide, while hydrogen burns to water. The temperature of a gas engine is such that this water invariably leaves the engine in the form of steam, carrying with it a large amount of latent heat. This heat so lost amounts to about 15 per cent of the calorific value of hydrogen. Besides this, hydrogen gas burns very quickly, while carbon monoxide burns slowly. As a result of this it is impossible to set the igniter, on an engine using producer gas containing a large proportion of hydrogen, at a point where the greatest efficiency can be obtained. If the igniters are set "early" enough, so that the carbon monoxide will be completely burned up in the explosion, the hydrogen will be exploded too quickly, while if the igniters are set at a point where the hydrogen explodes at the proper time, the carbon monoxide will not be entirely burned up before the exhaust valves are opened, and, as a consequence, it will pass out burning through the exhaust valves and into the exhaust pipe. The result is a loss in economy in the engine and, furthermore, the exhaust valves and pipes are burned out.

These troubles are particularly noticeable in engines running on suction producers because the per cent of hydrogen in the gas varies with the load on the engine, and it is very difficult to set the igniter so as to get fairly economical results. As a matter of fact, a gas may be very high in heat units, and yet it may be impossible to put full load on the engine on account of a high per cent of hydrogen.

The troubles resulting from the presence of a large amount of hydrogen in producer gas have led up to the in-

*Abstract of paper read before the Southwestern Electrical and Gas Association, El Paso, Tex., May 7, 8 and 9, 1908.

vention of a method of operation in which, instead of a jet of steam introduced under the fuel bed to keep down the temperature of the fuel, a part of the exhaust gas is returned and so introduced. The exhaust gas is composed principally of carbon dioxide and nitrogen. The mixture of the air and exhaust gas passes into the hot fuel bed and the carbon dioxide which is thus introduced takes the place of the steam. Carbon dioxide unites with the carbon in the fuel and forms carbon monoxide. In this process heat is taken up and compensates in part for the heat given off, as the air and fuel burn to carbon dioxide, so that the fuel bed is kept at such a low temperature that the fusion of ash and the formation of clinkers does not take place.

The following analyses show the difference in the gas made in this way and ordinary producer gas:

(The mixture of air and exhaust gases entering the producer includes: Carbonic acid (CO_2), 3.3 per cent; oxygen (O_2), 18.9 per cent; carbonic oxide (CO), 0.1 per cent.)

Analysis of Supply Gas (Per Cent).

	Using exhaust gases.	Ordinary system.
Carbonic acid (CO_2)	1.8	5.8
Oxygen (O_2)	1.2	1.3
Carbonic oxide (CO)	26.2	19.8
Hydrogen (H_2)	0.4	15.1
Marsh gas (CH_4)	0.7	1.3
Nitrogen (N)	69.7	56.7
British thermal units per cubic foot by gas calorimeter (high value)	103.7	136.0

Results.

As a result of this method several advantages are gained. In the first place, the igniters of the engine may be properly timed for the complete combustion of the carbon monoxide, and thus the greatest economy can be obtained; second, very little energy is lost through the latent heat carried off when steam forms at the time of the explosion; third, the gas leaves the producer at a lower temperature, and less water is required in the scrubber, and less heat is lost from the producer; fourth, the economy of the engine may be very largely increased by increasing the compression. The compression of the engine may be raised up from 140 pounds, which is about the maximum that is used in ordinary practice, to 200 pounds, and not only is the efficiency of the engine very materially improved, but the capacity of the engine is also increased. Certain tests have been made showing that an increase of 38 per cent in efficiency was gained, and that 25 per cent increase in load carrying capacity was also gained. It might be well here to call attention to the fact that this process is patented and the patent is held by the Combustion Utilities Company, 60 Wall street, New York.

The following is a record showing the results obtained on the same engine, which in one case was run on ordinary producer gas, and in another case on gas made without the presence of steam, and with the exhaust gas introduced:

Data and Results of Economy Tests.

	Exhaust gases used.	Ordinary system.
Date of test, 1906—	March 28-29.	April 5-6.
Duration, hours	25.5	14.05
Total time engine was running, hours	25.5	13.17
Maximum brake horsepower developed	110.5	99.8
Minimum power developed, horsepower	50.0	7.6
Average brake horsepower developed for engine period	102.5	78.7
Average brake horsepower for running period	102.5	84.1
Total weight of dry coal consumed, pounds	2,927.0	1,988.0
Total ash and refuse, pounds	391.0	317.0
Percentage of ash and refuse in dry coal	13.5	15.9
Weight of dry coal per hour, pounds	114.8	141.5
Dry coal consumed per brake horsepower per hour, pounds	1.12	1.8
Combustible consumed per brake horsepower per hour, pounds	0.97	1.51

The reliability of the service of gas engines operating on producer gas has been established, but in this connection it is well to call attention to the fact that all gas engines require greater care on the part of the operators than do steam engines. Steam engines, if they are supplied with steam and oil, will run in some sort of fashion as long as the load is not so great as to stall them; but gas engines will not run at all unless every part is in good working order, and, while careful attention should be given to a steam plant, it must be given to a gas engine plant.

IMPOSSIBILITY OF DIVISION OF OPERATING EXPENSES ACCORDING TO TENTATIVE CLASSIFICATION.

Accompanying the uniform letter to the interstate commerce commission criticizing Accounting Series Circular No. 20, published in the Electric Railway Review of May 2, 1908, page 529, was a circular from the Indiana and Ohio lines represented at the meeting in Indianapolis on April 14. This letter, signed by Joseph A. McGowan, secretary of the meeting, contained the following:

After a very thorough discussion of the following paragraph of the American Street and Interurban Railway Association's circular—"It is suggested, in order to develop the practicability and application of the proposed classification to the electric railway industry, that each company subdivide its 1907 operating expenses among the proposed accounts, in as approximate an estimate as time and convenience will permit"—the consensus of opinion was that in endeavoring to comply with this request it was found that the subdivisions could not be made with any degree of accuracy; that over one-half the apportionments would be mere estimates and that to be of real value to the interstate commerce commission the figures should be correct. To arrive at an accurate distribution would necessitate such an enormous expenditure of labor and time that it could not be correctly made within the period required.

One of the largest interurban railways of Indiana made an extraordinary effort to subdivide its operating expenses in accordance with the classification contained in Circular No. 20, and after devoting such time to the task, found that only 72 of the 116 accounts could be used; that 95 per cent of the operating expenses was contained in 35 accounts and that the remaining 5 per cent was distributed over 37 other accounts. It was further shown that out of the 72 accounts used the figures for 42 of these had to be estimated. The subdivisions in many cases amounted to only one-tenth of 1 per cent, and in some instances to one-hundredth of 1 per cent.

Rather than render an unreliable division of operating expenses to the interstate commerce commission it was unanimously

Voted, That the secretary of the meeting communicate with Prof. Henry C. Adams, in charge of statistics and accounts of the interstate commerce commission, Washington, D. C., and advise him that after an earnest effort to do so, the representatives of the interurban railways of Indiana and Ohio find it impossible to correctly subdivide their operating expenses for 1907 among the proposed accounts with any degree of accuracy within the allotted time, and that in their opinion it would be misleading to the commission and fail in its object and purpose to furnish any figures which did not represent actual results. It was further

Voted, That a copy of this resolution be also forwarded to the American Street and Interurban Railway Association.

PAY-AS-YOU-ENTER CAR TRIED IN DES MOINES, IA.

The Des Moines City Railway has been conducting an experiment of the pay-as-you-enter type of cars with one of its standard cars, of which the rear platform has been rebuilt to conform to the new method of fare collection. The tests will be made both with and without a 3-arm turnstile in the entrance passage.

The platform is eight feet long and is arranged similarly to other pay-as-you-enter cars, having an exit passage 24 inches wide and an entrance passage 36 inches wide. The turnstile is placed in front of the conductor's railing and registers all passengers. The conductors are also supplied with the Rooke automatic register and fare collector. The entrance door to the car body swings inward. The exit door slides toward the center of the bulkhead and is operated by the conductor by means of a lever. Passengers may enter the car by the front platform and may stand there but will not be permitted to stand on the rear platform until all the seats in the car are occupied.

It is announced that if the experiment proves successful all of the company's lines will be equipped with pay-as-you-enter cars within a year.

The Mankato Electric Traction Company opened for traffic on May 1 its 5-mile street railway in Mankato, Minn., which has been under construction since July, 1907.

STEAM TURBINE DEVELOPMENT.*

BY PROF. L. C. THORP, UNIVERSITY OF ILLINOIS.

Among the noteworthy facts that impress themselves upon the mind of the investigator of the development of steam turbines is the very close resemblance of the earliest types to many of the present-day machines that are proving such efficient prime movers in our power stations of both large and small capacity.

The principal difficulties in design and construction were early recognized. From the earlier days designers have endeavored to reduce the energy losses to a minimum and it is this desire that inspires present-day designers who have brought the steam turbine to the prominent place which it occupies in the list of prime movers. The energy losses, mentioned with their approximate values, may be classified as follows:

	Per cent.
Friction between the steam and the metallic surfaces, both stationary and moving	10
Friction due to eddy currents	5
Resistance to the rotation of moving parts in the atmosphere of steam, called "windage"	6
Mechanical friction in journal bearings, glands, stuffing boxes, etc.	5
Leakage through clearance spaces, glands, etc	3
Radiation loss, residual velocity in exhaust	4

Performance.

In 1902, after very careful consideration of the steam turbine problem, the then Commonwealth Electric Company of Chicago purchased the first 5,000-kilowatt machine that was built. It is worthy to note that the turbine, unit No. 1 in the Fisk street station of the present Commonwealth Edison Company, was the result of the first effort that had ever been made in this country to build a machine of this type larger than 600 kilowatts. The 600-kilowatt turbine mentioned was a 2-stage horizontal Curtis machine, installed in 1901 in the shops of the General Electric Company at Schenectady, N. Y. It is a compliment to the engineers and management of the General Electric Company, who built and installed this first larger unit, that they planned and built so well and confidently at that time.

The writer has been privileged during the past two years to conduct tests on three of the units in the Fisk street station of the Commonwealth Edison Company. A brief summary of the results of these tests is presented in the following table:

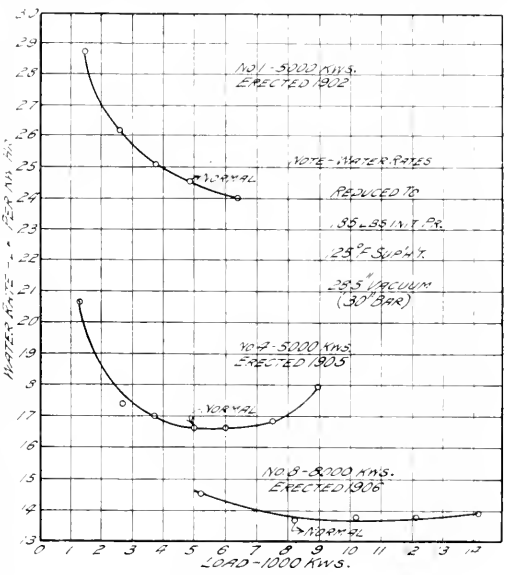
Operating Conditions.

Comparative Results—Best Performance.			
Nominal rating of machine, kilowatts	5,000	5,000	8,000
Load—			
Gross output, kilowatts	6,137	5,970	10,156
Per cent normal rating	1.25	1.20	1.25
Water rate—			
Observed kilowatt-hour	23.85	16.56	12.94
Corrected for "contract conditions"	23.94	16.72	13.07
Observed electric horsepower-hour	17.89	12.42	9.71
Corrected for "contract conditions"	17.96	12.54	9.80
Initial pressure, pounds	176.6	174.0	176.0
Vacuum observed, inches	28.10	28.0	29.17
Vacuum, 30-inch barometer, inches	28.52	28.30	29.50
Superheat, degrees F.	139.0	184.0	147.0
First stage pressure, pound gauge	5.66	34.8	46.7
Normal speed, revolutions per minute	500	500	500

Accompanying curves, Figure 1, present the relative steam economies of these three units in a very interesting manner. It will be seen that the scale of the vertical ordinate, representing "water rate," is continuous, thus giving a direct comparison of the units, all values of the steam economy having been reduced to the basis indicated. Another notable feature is the flatness of the load curve for unit No. 8. It is noticeable in No. 4, but less markedly, and the tendency to give a wide range of economy with a considerable range of load is hardly perceptible in the first unit. It is difficult to say what the results would have been in the latter case had the load been increased to 75 per cent overload, as in the case of No. 8. These curves serve better than words to illustrate the remarkable development in the design and operation of large turbine units of this type during the past five years.

Figure 2 presents the steam economy of Westinghouse-Parsons units of various rated capacities, under the actual operating conditions. It is significant that the curve of water rate of the 400-kilowatt unit coincides with the curve of the 5,500-kilowatt machine up to their normal capacities. Both machines were operating under similar initial and final pressures, but the small unit was supplied with steam superheated 100 degrees, whereas the initial steam for the large machine was saturated.

It is exceedingly important that accurate means be secured for reducing the performance to a common basis for purposes of comparison, whether various types and sizes of units are involved, or the agreement of actual performance with guarantees in contracts is in question. For these purposes "performance curves" should always be determined which will present the variation in economy due to changing conditions of vacua, superheat, pressure, etc. Typical "performance curves" are shown in Figure 3. Most significant of these curves and most worthy of special mention is the "initial pressure" curve, which demonstrates the futility, from the standpoint of economy, of increasing the initial pressure much above 140 pounds gauge. Up to this point the inclination of the curve is quite marked, and the advantage of increasing pressures as a means of reducing water rates very apparent. Beyond this point the curve tends to become more nearly parallel to the pressure co-ordinate, indicating an advantage, and that a somewhat questionable one, only in gaining capacity. This deduction is in accord with numerous investigations recently conducted, which have resulted in a diminishing of enthusiasm for high initial steam pressures. It will be of interest to mention that the government engineers in charge of the steaming tests of the United States geological survey have also advanced the proposition that lower steam pressures and high degrees of superheat will be found desirable and economical in the operation of steam prime movers.



Turbine Development—Figure 1—Economy Curves for Curtis Units of Three Sizes.

Small Turbines.

Before passing from the consideration of steam economy it will be well to consider examples of the numerous smaller machines that are attracting attention. Among the turbines of this class that have appeared quite recently are the Kerr, the product of the Kerr Steam Turbine Company of Wellsville, N. Y.; the Sturtevant, recently perfected by the B. F. Sturtevant Company; and the Terry, built by the Terry Steam Turbine Company of Hartford, Conn. These small machines are all of the multi-stage impulse type, the Kerr applying the principle of the Pelton wheel and all of the others mentioned being modifications of the Riedler-Stumpf pattern.

Low-Pressure Turbines.

A number of plants have been installed more or less recently that have employed low-pressure turbines as prime movers, which are operating on the exhaust steam from reciprocating engines in the same station. By this means great economy is effected in the use of the steam, and a saving

*Abstract of paper presented before the Western Society of Engineers, Chicago, May 6, 1908.

of practically 65 per cent may be effected by the use of a high-vacuum condensing equipment. Practically all of the builders of turbines of large capacity have developed a low-pressure turbine, and these are playing a prominent part in the design of power plant extensions. One of the prominent installations of low-pressure turbines is in the power station of the Philadelphia Rapid Transit Company. This machine is an 800-kilowatt Curtis turbine unit, operating on the exhaust from Corliss engines and utilizing a vacuum of 28 inches. The guarantee provides that the steam consumption per kilowatt-hour shall not exceed 36 pounds at full load, and 40 pounds at half load. Tests that have been made indicate a water rate well within the guarantee. Tests made in the shops of the Westinghouse company upon a 1,250-kilowatt low-pressure unit have resulted in a water rate of 30 pounds per brake horsepower-hour, this being the equivalent of approximately 38 pounds per kilowatt-hour.

Heat Efficiencies.

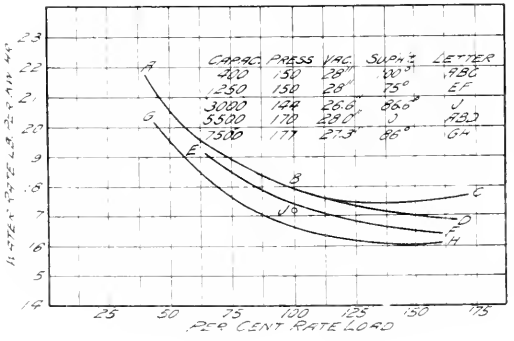
The Willans-Robinson Company of England recently entered into a contract for the construction and erection of a 3,000-kilowatt unit. This contract contained a performance guarantee clause, stipulating a water rate of 12.9 pounds per kilowatt-hour. This is equal to the best performance of the 8,000-kilowatt Curtis turbine.

We are fast approaching the limit of economy in the prime mover itself, and future developments must be looked for in the steam generator. Greater economy must be secured in the performance of the boilers. It is significant that practically the same rated boiler capacity was installed for the first 5,000-kilowatt unit in the Fisk street station of the Commonwealth Edison Company of Chicago, as six years later was installed to operate the 9,000-kilowatt units. This points to developments in boiler practice as well as to remarkable advances in the large turbo units.

Boiler Economy.

In most plants the steam-driven auxiliaries do not furnish enough exhaust steam to heat the feed water above 120 degrees F. The possibility of increasing economy by using hot feed water has been taken advantage of in some cases by the installation of economizers. Other engineers have taken steam from the second or third stage of the turbines to increase the feed water temperature, and this without suffering a deleterious effect in economy.

In a recent article before the American Institute of Electrical Engineers, J. T. Findlay presented a very interesting



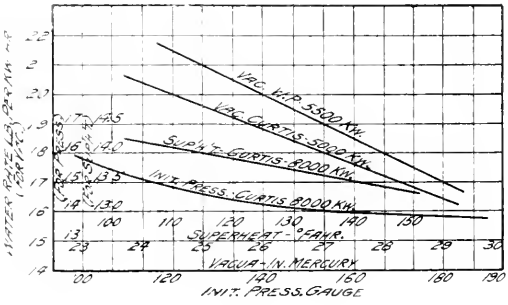
Turbine Development—Figure 2—Economy Curves for Westinghouse Units of Three Sizes.

discussion of experiments with double stoker boilers in the power plant of the Interborough Rapid Transit Company of New York City, made under the general supervision of H. G Stott, superintendent of motive power of the Interborough company. These boilers were 500-horsepower units, set with two Roney stokers, one as in the standard setting and the other at the rear at a somewhat lower level. The horizontal baffling was so arranged that the gases from both stokers intermixed and traversed the same passes over the heating surface. This increase in volume of gases, with the resultant higher velocity, effected an increase in capacity of 80 per cent, with no appreciable difference in over all efficiency.

This suggests what is very much discussed, namely, the possibility of securing a greater amount of work from our boilers. It leads to the prediction that we are rapidly approaching the point when we will be able to rate water tube boilers on a basis of five square feet of heating surface per horsepower, instead of 10, as now used. Experiments such as are now being made, of which the one cited is a good example, foreshadow the design and operation of larger boiler units, the reconsideration of generally accepted theories regarding heat transmission through boiler heating surface, and the redesign of boiler settings that have been standard for years. There must be a constant striving for better evaporative performance—for a decrease in the radiation and unaccounted-for losses in boiler practice—if this factor in power plant development is to keep pace with the modern prime movers.

Rating of Steam Turbines.

An inspection of curves suggests a very significant fact pertaining to the rating of steam turbines. The maximum steam economy is obtained at loads varying from 115 to 130 per cent of the rated capacity of the units, and no considerable increase in water rate occurs at 150 per cent of the normal rating. This is in direct contrast to the conditions



Turbine Development—Figure 3—Performance Curves.

which obtain in reciprocating engine practice, where increasing the load above the normal rating or point of maximum economy brings about a marked increase in the water rate. The reciprocating units are designed to sustain a certain overload for a period of time, usually 50 per cent for two hours, but it is obvious that this maximum capacity should not form the basis for normal rating. In the light of these facts a change is being effected in the system of rating turbines, and it will not be long until such rating will be based upon the continuous maximum operating capacity instead of upon a normal load basis of the turbines, and generators will be installed capable of such continuous operation. It will be seen that this will not present a radical departure from the practice which now obtains with reference to some prime movers, such as gas engines or water turbines, where the best performance occurs at points of maximum capacity, and where guarantees of performance seldom contemplate any considerable overload capacity.

In conclusion it should not be said or inferred that the steam turbine is supplanting the steam engine in the broad field of the latter's usefulness, nor that the days of the "old reliable" are numbered. Certain it is, however, that for electric generation for all purposes, particularly in large units, the steam turbine of the past decade has proven its superiority.

Where Electric Locomotives Gain.

Each ton moved, whether of useful trailing load or of locomotive weight, costs a certain amount of money. If the locomotive weighs 150 tons and the train consists of, say, five cars, aggregating about 250 tons, then the useful car ton mileage will be only 62.5 per cent of the total. Take an actual case: On the New York Central line, between the Grand Central terminal and North White Plains, each steam locomotive moved each day an average of 25,620 ton-miles. Of this total 12,960, or 51 per cent, were locomotive ton-miles and 12,660, or 49 per cent, were useful car ton-miles. With electric operation each locomotive moves each day 33,210 ton-miles. Of this 11,700, or 35 per cent, are locomotive ton-miles, and 21,150, or 65 per cent, are useful car ton-miles. These figures plainly show the great saving of non-revenue bearing ton mileage which is made possible by the use of the electric locomotive.—Electric Trunk Line Age.

PARKS OF THE GRAND RAPIDS RAILWAY.

The problem of conducting a summer amusement park as a successful money-making venture has been satisfactorily worked out by the Grand Rapids Railway Company at its two parks, Ramona and North park, near Grand Rapids, Mich. In round numbers the two amusement resorts represent an outlay of $250,000, and, according to Louis J. Delamater, manager of the resort properties, the returns on the investment are entirely satisfactory to the company.

Ramona, which covers an area of 23 acres and which has been called "The Coney Island of the Middle West," is situated on Reed's lake about three miles from the heart of Grand Rapids and is reached by three of the company's lines. The park is a part of the village of East Grand Rapids, which has about 1,000 population. Besides a large pavilion containing a summer theater, refreshment booths and a Japanese restaurant, a large number of concessions are located about the grounds. There is also one of the largest ball parks in the middle west and a large picnic ground. Boating, bathing and fishing are among the attractions offered.

Grand Rapids Railway—Ramona Pavilion.

The grounds of the railway company are located on the north shore of Reed's lake, which is about 1½ miles long and 1 mile wide. In the rear of the grounds is Fisk lake, about ½ mile across in either direction. The two lakes are connected by a small channel. On the other side of Reed's lake is Manhattan beach, a bathing and picnic resort, not controlled by the railway company, which is reached by two steamers and electric launches.

The pavilion at Ramona is practically new, having been built a few years ago to replace an old one which was burned. It is a wooden and steel structure, 182 by 205 feet, open on three sides, and represents an investment of $50,000.

The theater, stage and auditorium occupy nearly three-fourths of the entire structure and 1,200 persons may comfortably attend a performance. The stage has a 40-foot opening, is 38 feet deep and 68 feet wide and is equipped with all modern stage improvements. The electric lights are supplied with current by the Grand Rapids-Muskegon Power Company of Grand Rapids. The vaudeville acts are booked from selections offered by the Western Vaudeville Association and are of a high class. The prices for admission to the auditorium, which contains 18 boxes besides regular theater chairs, are 10, 20 and 30 cents at the evening performances and 10 and 15 cents at matinees, except on Sundays and holidays, when evening prices prevail. At the rear of the auditorium is a board partition about four feet high, over which persons may view the performance free of charge. The theater is flanked on one side by an ice cream parlor and on the other by the Japanese restaurant. These concessions are separated from the theater by clouded glass partitions.

In the rear of the theater is a large resting room, open on three sides, and provided with benches. A small cigar and tobacco stand and a candy stand occupy a small portion of this room. On one side of the pavilion is a long veranda with benches.

Around the pavilion "on the circle" are the following concessions: "Figure Eight," laughing gallery, "Ye Olde Mill," roller rink, miniature railway, photograph gallery, shooting gallery, "Razzle Dazzle," Japanese ball game, box ball alleys, moving picture theater, circle swing, together with candy stands, soft drink booths, popcorn stands, etc. The railway company owns the roller rink.

Leading from the main steps of the pavilion a concrete walk runs to the boat landing, where electric launches, rowboats and steamboats await. On the shore of the lake is the fine new building of the Colonial Club, one of the most exclusive clubs maintained by Grand Rapids society. There are benches scattered here and there along the lake shore in front of the pavilion, the building itself being upon a small elevation. To the east of the pavilion is a small concert garden conducted by private parties, where vaudeville shows are held. Several social clubs also have fine homes at the resort. All parts of the grounds are open and no admission whatever is charged to the resort. No liquor is sold on the grounds and the village council strictly enforces the Sunday liquor law in the whole village.

Grand Rapids Railway—Pavilion and Boat House at North Park.

To the south of Ramona pavilion is the railway company's large baseball park, Ramona Athletic Park, which is used regularly by the Central and Grand Rapids baseball leagues and at other times by picnickers. A charge of $15 per day is made for the park. In cases where large picnics are held this $15 is usually refunded to the organization giving the picnic in some kind of a donation. The grounds and grand stand represent an outlay of $25,000 and about 6,000 persons

can be comfortably seated in the grand stand and on the bleachers. At the west of this is the picnic ground, occupying about two acres. There is another small picnic ground to the north of Ramona pavilion.

Among the features promised for the season which opens May 16 is a miniature Panama canal, built by Fred Kempf of Grand Rapids. This is a model operated by complicated machinery and shows the work along the canal, the cities, the ocean and steamships, the railroad trains, etc. There will also be an aerial cable railway, a "devil's slide," something on the order of the "figure eight" roller coaster and a "human laundry." It is promised that the bookings at Ramona this season will be of a higher class than usual. The summer programme includes balloon ascensions and several feature days, such as toy hunts, fairyland nights, Venetian nights, animal hunts, Teddy bear day and Japanese night. Already arrangements are under way for several big picnics to be held this season.

The fare to the lake from any part of the city is five cents and it can be reached from any point in Grand Rapids within half an hour.

North park, the company's other resort, is located about six miles north of the city on the Grand river. It is served by the Wealthy avenue and Taylor street line, which connects it with Reed's lake, passing through the city and near the Michigan Soldiers' Home, which is about one-fourth of a mile from the park. The park may be reached from Reed's lake in about half an hour for a 5-cent fare. North park occupies about four acres of ground and represents an investment of about $50,000. It contains a pavilion 85 by 160 feet, the boathouse of the Grand Rapids Boat and Canoe Club, and a 2-acre picnic ground. In the pavilion are refreshment parlors, a boat livery and a large dance hall. Balloon ascensions and band concerts are held frequently during the summer.

Considerable traffic is also derived by the railway company from John Ball park, a municipal park located west of the city.

SECURING PUBLIC GOOD WILL BY BULLETINS.

The Portland (Ore.) Railway Light & Power Company has begun publishing a series of bulletins in the daily papers of the city which are designed to secure the good will of the public by pointing out what efforts the company is making to give good service and explaining the difficulties which are involved in street railway operation. Bulletin No. 1 deals with the subject of "Kicks" and presents the case in such an excellent manner that we publish it in full, as follows:

The Portland Railway Light & Power Company is a public service corporation and we realize that the most valuable asset a public service corporation can have is the good will of the public. We are trying to be candid and sincere in all our dealings with the public and with the city, and we frankly admit that we shall consistently strive to secure and maintain the good will of the people of Portland.

It is an important part of our business to run a street railway and to run it efficiently. We feel that we can do more, ordinarily, by attending to our business than by entering into discussions or explanations.

The secret of getting along with the other fellow in this world is to have a better understanding of his troubles. The man who is the sharpest critic is often the best friend when he understands the other fellow's job.

Comparatively few people realize the difficulties of modern street railway operation. When anything goes wrong, everybody notices it; whenever everything goes right, nobody notices it.

We want to have everything go right and everybody to notice it. We feel that we are making friends with the people of Portland, and that our efforts to give the best service possible are being appreciated. This is not the accomplishment of a day, but the result of grinding work and large expenditures for some years past, and we desire to show the public what we have done and are doing for the improvement of the service; what problems we meet with daily, and some of the methods which would be mutually helpful and beneficial to the railway company and the public.

You may take this fact as assured, that it will not be possible to remove all sources of complaint. There is the amiable gentleman who kicks at home and growls all day at his office.

We cannot expect to escape him between time. He will probably kick at the publication of these articles. But, leaving him out of the question, it is still plain, from the nature of the business, that there will frequently be unavoidable troubles and inconveniences.

We carry a large portion of the population of Portland twice a day. Counting the transfers, people step up and down from the cars 320,000 times a day. The street cars of Portland pass backward and forward through crowded streets, covering about 29,000 miles, or one and one-quarter times the circumference of the globe, in a single day. There will always be accidents under these circumstances. Then, too, the conductor's lot is not a happy one. He has to collect money from people of all sorts and dispositions. He alone is expected to keep his temper, and it is his duty to do so. If he does not, upon proper complaint, he is disciplined, and perhaps discharged. We endeavor to secure the highest class of employes. We are proud of the character and courtesy of our men, and we believe that, as a body, they have not their superiors in the country. Still, they are only human, and they make mistakes. Many a reasonable kick will necessarily be registered against us. The unreasonable kicks come hard. We feel that we can do away with many of them if the public understands the street car business a little better. We want to present to you a series of articles discussing some of the problems, together with a statement of how we are meeting them.

As for the reasonable kicks, we want to hear them. They help us. We realize that we can best serve ourselves by serving you. An outsider can sometimes suggest remedies for existing conditions which have escaped the men engaged in the detail of the work. Suggestions are solicited.

If, by telling you our story, you will understand us better, and the spirit of mutual helpfulness will be advanced, we shall feel that our work has been well done. We welcome honest criticism, particularly if it is good-natured.

REPORT ON ELECTRIC RAILROADS IN PENNSYLVANIA.

The annual report of the bureau of railways of the state of Pennsylvania for the year ended June 30, 1907, has been submitted to the governor by James H. Craig, superintendent of the bureau. The total capitalization of the street railways of the state is given at $464,553,942; total capital stock outstanding, $144,890,438; total funded and unfunded debt, $79,439,443; total cost of roads and equipment, $225,798,775.

Figures showing the increases for the year, as compared with 1906, include the following:

Capital stock outstanding	$29,231,030
Funded debt outstanding	19,541,702
Current liabilities	7,797,888
Capitalization and current liabilities	$56,570,620
Cost of road and equipment	$41,905,336
Stocks and bonds of other companies owned	13,586,174
Cash and current assets	1,857,468
Total assets	$57,348,978
Gross earnings from operations	$ 2,911,331
Income from other sources	646,502
Total income	$ 3,558,260
Operating expenses	$ 2,787,061
Taxes	79,861
Interest on debt	595,979
Rentals	426,165
Other expenses	176,682
Dividends	259,013
Total	$ 3,968,397
Miles of single track and branches operated	264.53
Length of all tracks operated	304.20
Total number of cars	690
Total number of employes	3,396
Total compensation	$2,093,537
Total passengers carried, including transfers	87,935,058
Capital stock outstanding	$33,255,019
Funded and unfunded indebtedness	2,692,219
Cost of road and equipment	28,112,956
Income through rental of road and other sources	1,294,882
Dividends paid	2,004,210

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. I. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Company Not Liable for Injuries to One Passenger Caused by Another Giving Signal to Start.

Wagner v. New York City Railway Company, 107 New York Supplement, 807.—The supreme court of New York, appellate term, says that the question upon which this case turned was: By whom was the signal given that caused this car to start after it had stopped and while the plaintiff was in the act of alighting? The defendant's testimony was that the bell to start was given, not by the conductor, but by "a young man standing on the back platform," who "rang the bell twice and the car went ahead," who got off the car before the conductor got to the back platform. This testimony was not rebutted, stood absolutely uncontradicted, and was the only testimony in the case on either side as to the cause of the car's starting while the passenger was alighting. Under such circumstances a verdict for the plaintiff could not stand. How could negligence of the defendant be predicated upon the unauthorized act of this passenger? Certainly the motorman, in receiving the signal and starting his car, was not guilty of an act from which negligence could be deduced

Duty of Pedestrian Walking on Track.

San Antonio Traction Company v. Kelleher, 107 Southwestern Reporter, 64.—The court of civil appeals of Texas says that a pedestrian usually is expected to take the sidewalk, when not crossing the street, a part of the street generally dedicated to the use of those traveling over it on foot. Conditions, however, may be such as may induce him to exercise his right to walk along that part over which the car track is laid. But when he does this he has no right to prevent those in the exercise of their right to travel in street cars of the convenient and speedy mode of transportation for which street railway companies are designed by walking in front of an approaching car, and thereby limit the speed of the car to that made by him in walking. In such event it is his duty, if he is where he can safely do so, to step aside and let the street car go on at its usual speed. It is true that the one operating the car cannot run him down if he sees that he is not going to leave the track; but the court apprehends that the company is not without the right to have him removed and kept off the track until its car passes.

Motormen Must Keep Close Lookout and Give Warning at Crossings—Concealment of Headlight by Dust.

Zalotuchin v. Metropolitan Street Railway Company, 106 Southwestern Reporter, 548.—The Kansas City court of appeals says that the plaintiff's evidence abundantly sustained the charge that the bell was not rung as the car approached the crossing, and that the motorman was negligently inattentive to the track ahead of him. Whether the rate of speed at which the car was running was 25 or 30 miles per hour, as the testimony of the plaintiff's witnesses would seem to indicate, or was only 10 or 12 miles per hour, as stated by the witnesses for the defendant, the fact remained that the motorman was operating a powerful and dangerous vehicle along a public thoroughfare where others had a right to be, and, in the exercise of reasonable care, could not approach a crossing where he had reason to anticipate the presence of vehicles and pedestrians without keeping a close lookout and without giving warning of the presence of the car

But the assertion of the driver of a wagon that when he looked just before starting the car was not visible, for the reason that it was at that time more than a block away, and, on account of its great speed, was raising a cloud of dust in front of it which totally obscured the headlight, was too absurd to merit serious consideration. It could not have been more than 100 feet away, even had it been going at top speed, and the contention that a swiftly moving vehicle under ordinary conditions of wind and weather will throw up a cloud of dust in advance of it is a proposition in physics beyond the comprehension of reasonable minds. Such evidence goes for naught against the plain physical facts of the situation.

Duty at Stations.

Birmingham Railway Light & Power Company v. Landrum, 45 Southern Reporter, 198.—The supreme court of Alabama says that the place where the injury occurred in this case was at a station, where the cars were in the habit of stopping for persons to get on and off the train. Under such circumstances the carrier owes them a duty, that while making their egress they be not struck by other passing trains, and, while a passenger is not absolved from the duty of exercising care for his safety, he has a right to presume that the tracks intervening between the place where he is to alight and the station will be kept safe while he is crossing; so that the mere fact that he fails to look and listen for an approaching train before attempting to cross will not, as a matter of law, be ascribed to his contributory negligence, and will not prevent a recovery of damages if he is struck by such a train. Again, the court says that a passenger may alight from a slowly moving street car. A passenger car, within a very short distance of a station, is likely to be discharging passengers, and it would be culpable negligence for another car operated by the same company upon the same highway, to run at full or very rapid speed.

Injury to Man Stooping Over in Way of Car to Unload Wagon—Duty of Motorman—Assumptions—When No Car Has Passed in 15 Minutes.

Volosko v. Interurban Street Railway Company, 82 Northeastern Reporter, 1090.—The court of appeals of New York says that the plaintiff was struck by an electric car while he was standing on the hub of a wagon, engaged in unloading blocks of marble from the wagon, which was standing near the track, the distance between the rail and the hub of the rear wheel being five or six inches. While the jury would have been authorized to find the defendant guilty of negligence, was the evidence strong enough to permit it to find the plaintiff free from contributory negligence? The court thinks not, because he knew that he was in a place of danger, and it was his duty to exercise some care for his own safety; yet he took no care whatever. While he had a right to stop his wagon where he did, temporarily, for the purpose of unloading, his rights were subordinate to those of the railroad company, which had the right of way. He had no right to obstruct travel upon the railroad, and it was his duty to get out of the way when a car came along so as to let it pass.

The plaintiff had no right to assume that there was no danger because no car had passed for 15 minutes, as the longer the interval without a car the stronger the probability that one would come along at once. He stood for 5 or 10 minutes so near the track of a street railroad as to be within reach of a passing car, without once looking to see or listening to hear whether one was coming, and the court thinks he was guilty of negligence as matter of law, even if his duties required him to stoop over so that looking or listening was not as easy as if he had been in an upright position. The law required him to use ordinary care, such as a person of average prudence would use under like circumstances.

Assuming, without deciding, that the plaintiff had the same rights as a street sweeper, for instance, still he could not keep his eyes upon his work all the time and not look, listen or observe any caution of any kind for his own safety without so contributing to the injury he sustained as to defeat a recovery of damages. The case was properly nonsuited

News of the Week

Brooklyn Subway Extension Opened.

The extension of the Interborough subway from the terminus of the East river tunnel at Borough Hall, Brooklyn, to the Atlantic and Flatbush avenue station of the Long Island Railroad was opened for traffic on May 1. The new branch serves three stations in Brooklyn and connects the Manhattan lines with the extensive system of the Long Island Railroad. The opening of the new line was made the occasion of elaborate celebration in Brooklyn and a banquet was held in the evening at the Union League Club, at which officers of the company and city officials made speeches. August Belmont, who financed the construction of the subway, was the guest of honor. After reviewing the development of transportation facilities since the days of the horse car, he said in part:

"Today we are at a standstill because we have become unreasonable in our hostility and are sapping the life out of our transportation lines with increasing taxes and hostile legislation. You will say, 'What is the remedy?' I can't tell you what it absolutely is, but I can tell you what I think will effect a cure. Standardize your traction securities by permitting them before they do anything else to make a profit. Limit it fairly so that the investor has unflinching confidence in its securities and then let the city take its compensation in a surplus in lieu of all taxes and any and all state and municipal charges. Until you bring about something of this nature you have reached the point where the increase in transportation facilities in New York, but more particularly on Manhattan island, is liable to remain practically checked. I feel, however, that we are on the road to a clearer and better understanding, and I cannot but believe that the coming year will see a beginning of a new and important move toward very much greater transportation facilities."

Aid by the United Railways & Electric Company in Reconstruction of Baltimore.

Bulletin No. 10 is the conclusion of the remarkable series which has been published by the United Railways & Electric Company of Baltimore. This bulletin states in part:

"When in February, 1904, the business section of our city lay in ashes; when the 'calamity howlers' said that the city was as a city of the dead; that its business and commerce would pass to more favored cities, and that our working population would seek homes elsewhere, what was then the policy of our company?

"It was the hardest hit of any enterprise in the city. The great flames had swept into the Pratt street power house; the feed and trolley wires in the burnt district lay in twisted masses on the streets; the company's main offices were destroyed, and its whole clerical force was without official home. Inside of 12 hours the company's cars were running through the unburned section, and, as quickly as the streets were cleared, wires were strung and the company's cars followed.

"The company not only responded quickly to the need of transportation service at the time, but the fire was hardly out before its directors developed large and more comprehensive plans than ever before for the improvement and betterment of the street car service and for leading in the restoration of the city. These plans have been steadily pursued.

"Since the fire the company has expended for the general betterment of the street car service, for the reconstruction of tracks with heavy grooved rails, for the purchase of large, commodious cars, for extensions, for conveniently located car houses, for building, rebuilding and equipping power houses and for other betterments which would increase the efficiency of service, over $10,000,000."

Strike Threatened in Cleveland.

Immediately after assuming control of the Cleveland street railway lines on April 28 the Municipal Traction Company found itself involved in difficulties with its employes on the question of wages. President A. B. du Pont announced that the former employes of the Cleveland Electric Railway would be paid the same scale as had been paid to the Forest City men, 22 cents an hour for the first year, 24 for the second and 25 for the third and thereafter, an increase of one cent an hour over the Cleveland Electric scale, and that they would be given one uniform a year free, but no free transportation.

The men refused to be satisfied with the increase, saying that the loss of free transportation while in uniform was not compensated for by the 1-cent increase, and demanded the fulfillment of the agreement made by the Cleveland Electric Railway on December 26, 1906, that, in case the company secured a renewal of its franchises from the city a scale of 23, 25 and 26 cents would be put into effect at once. The Cleveland Electric men also considered that they were unfairly treated because the Forest City employes were in many cases given a preference of runs. Mr. du Pont had followed the plan of arranging the men according to seniority and giving a Cleveland Electric man the first choice, a Forest City man the second, etc.

Mr. du Pont refused to abide by the Cleveland Electric agreement, saying that the Cleveland Electric Railway was not operating the property and that he had been assured by Mr. Goff and other lawyers at the time of the settlement that it was not binding on the Municipal company. The dissatisfaction of the men was further increased by the discharge of about 50 men on charges of dishonesty, breaches of discipline and for refusing to collect fares from fellow employes.

On Friday night a meeting of the union was held and the executive committee was authorized to call a strike if the increase was not granted by Sunday morning. On Saturday and Sunday several conferences were held between representatives of the union, Mayor Johnson, President du Pont and members of the state board of arbitration. Mr. du Pont refused to recognize the agreement in any way and the mayor endeavored to conciliate the men by promising an increase as soon as it had been demonstrated that the earnings would justify it. On Sunday it was agreed to appoint an arbitration committee, consisting of one man selected by the company, one by the men and a third by the first two, to determine whether the agreement was binding. Mr. du Pont wished to have the general question of wages, rather than the validity of the agreement, passed upon by the arbitration committee and declined to appoint an arbitrator until a meeting of the directors could be held.

The union then presented an ultimatum that if the company's representative were not appointed by 2 p. m. Tuesday the strike would be declared Wednesday morning, but on Tuesday it was decided to await a meeting of the directors, to be held on Wednesday or Thursday.

The suburbs outside of Cleveland are up in arms because the 3-cent fare is made effective only within the city limits. As reported in last week's issue, Mayor McQuigg of East Cleveland was put off a car for refusing to pay a 5-cent fare and the village brought suit against the company. The suburb's claim is based on the franchise granted to the Cleveland Electric Railway in 1906, which, it is claimed, specified a 5-cent fare to the center of Cleveland or such rate of fare as may be charged on the Euclid avenue line. Since the settlement the Euclid avenue line is operated at a 3-cent fare. Residents of Lakewood, Collinwood and Corlett protested because they were obliged to pay a 5-cent and sometimes an 8-cent fare to Cleveland, and plans are being made to attack the company's franchises.

President du Pont has announced that transfers would be received from the printers and put in use this week. A charge of one cent will be made for transfers. The officials of the company have been at work on extensive plans for rerouting some of the car lines as soon as the transfers are received.

F. H. Goff, who represented the Cleveland Electric Railway in the negotiations leading to the settlement, has declined election as chairman of the board of directors of the Municipal company.

Dashboard Destination Signs Replaced.—At the request of the city council the Portland (Ore.) Railway Light & Power Company has replaced the dashboard destination signs, displaying the initial letter of the name of the line, which were recently removed from the cars.

Elevated Road Consolidation in Chicago.—Another attempt is being made to bring about the consolidation of the elevated railways of Chicago with the possible ultimate intention of including in the combination the Commonwealth Edison Company. Samuel Insull, president of the latter corporation, has undertaken to carry the negotiations to a conclusion.

Racine Franchise in Dispute.—Burr Jones, an attorney of Madison, Wis., who has been retained by the city of Racine, Wis., to investigate the status of the franchise of the Milwaukee Light Heat & Traction Company, has rendered an opinion that the company's franchise in Racine expires on May 27. The company claims that the franchise is indeterminate.

St. Paul-Seattle Air Line Declared Fraudulent.—According to press reports from Seattle the St. Paul Minneapolis & Seattle Electric Railroad, which was incorporated several months ago to build an air line third-rail electric railway from St. Paul to Seattle, and which has been disposing of large amounts of stock at bargain prices, has been prohibited

from circulating its alluring advertising literature through the mails by the postoffice department at Seattle on the ground that the promoters of the company are not financially responsible. W. C. Webber of Minneapolis is president of the company.

Tirey L. Ford Acquitted in San Francisco Franchise Case.—Tirey L. Ford, general counsel of the United Railroads of San Francisco, was acquitted on May 2 of the charge of having bribed a supervisor to vote for the company's overhead trolley franchise. This is the second time Mr. Ford has been acquitted on similar charges. Several other indictments remain to be tried.

Protest Against New York Rapid Transit Bill.—Several civic organizations of New York have asked Mayor McClellan to disapprove of the Robinson bill, recently passed by the state legislature, which permits the granting of franchises for subways to private corporations. The principal objection urged against the bill is that it provides for an alternative to municipal ownership.

Increase of Wages on New York Suburban Lines.—Justice Morschauser of the New York supreme court has issued an order authorizing the receivers of the Yonkers Railroad, the Westchester Electric Railroad and the Tarrytown White Plains & Mamaroneck Railway to increase the wages of their conductors and motormen approximately 15 cents per day. The employes were made a party to the application of the receivers for permission to increase wages.

Convention Committee Visits Denver.—The joint committee of the American Street and Interurban Railway Association and the American Street and Interurban Railway Manufacturers' Association, appointed to determine the date and the place for holding the next annual convention, has been visiting Denver this week to confer with the Denver Convention League and to investigate the facilities afforded by the city for the convention as compared with other cities which have extended invitations to the associations.

American Society for Testing Materials.—The eleventh annual meeting of the society will be held at the Hotel Traymore, Atlantic City, N. J., Tuesday to Saturday, June 23 to 27, 1908, inclusive. The congestion of the programme in past years, necessitating parallel sessions, has led this year to the extension of the time of the meeting from three to five days. By this arrangement it is hoped that the necessity of holding sessions concurrently will be avoided, and that provision may be made for periods of recreation and special social features. Since the last annual meeting the membership has risen from 925 to 1,005.

Interborough Rapid Transit Company Sustained in Tax Decision.—The New York appellate division, third department, on May 6 rendered a decision sustaining the claim of the Interborough Rapid Transit Company that it is exempt from special franchise assessments. The company appealed from the action of the state board of tax commissioners in assessing the special franchises at $9,000,000 for the year 1905, on the ground that it was exempt from this class of taxation under the provisions of the rapid transit act, under which the subways in New York City were constructed and are now operted by the Interborough company.

Toronto Section American Institute of Electrical Engineers.—The regular meeting was held April 24 in the engineering building of the University of Toronto. H. W. Price of the University of Toronto presented a paper on the oscillograph, showing by means of slides the essential characteristics of manufacture and operation. Slides were also shown of oscillograph records of current and voltage taken on the occasion of sundry operations with direct and alternating current motors. A number of oscillograph records taken on the lines of the Ontario Power Company at Niagara Falls were then shown and explained by Mr. Johnson, assistant engineer of that company.

W. R. Willcox on New York Public Service Commission.—William R. Willcox, chairman of the New York public service commission of the first district, addressed the City Club of Chicago on Monday of this week in regard to the work of the New York commission. Mr. Willcox expressed himself as heartily in favor of state regulation of public utilities and stated that the commission had been very successful in New York in bringing about improvements in service. He said that the fact that companies are required to seek the commission's permission before issuing additional securities has been of great value to the companies because its authorization of an issue, based on a thorough investigation of a company's condition, provides a sort of guarantee that the securities are amply protected. Such matters as rate regulation, he said, could be handled more profitably by a commission than by the state legislature, because the latter had neither the time nor the familiarity with the subject requisite for proper decision. In regard to the plans for the proposed subway in Chicago Mr. Willcox said that the city should build the subway itself and lease it to an operating company, but if the city was unable to finance the construction a franchise might be granted to a private company, with a reservation of the right of the city to purchase the property after 25 years.

The Alternating-Current Commutating Motor.—Dr. Charles B. Steinmetz delivered an address on alternating-current motors before the Ithaca section of the American Institute of Electrical Engineers on April 17. There were 350 students and instructors present. Dr. Steinmetz discussed the various types of the alternating-current commutating motor, explaining the difficulties of commutation in such motors. He pointed out that compensation for the reactance and transformer voltages involved was a complicated problem and showed the latest inventions and devices for insuring satisfactory commutation at various loads and speeds.

New York Railroad Club.—The next regular meeting of the New York Railroad Club will be held at the building of the United Engineering Societies, 29 West Thirty-ninth street, on Friday evening, May 15, 1908, at 8 o'clock. The technical paper of the occasion will be presented by Alexander Crawford Chenoweth, his subject being "Reinforced Concrete with Special Regard to Its Use in Railroad Work." This paper was arranged for in response to requests from a number of members of the club, and in view of the experience and knowledge of the author as an expert, an interesting and instructive evening is anticipated. All interested in the topic are invited to attend and participate in the discussion.

Pittsburg Wage Controversy Submitted to Arbitration.—The fear of a strike of the car men employed by the Pittsburg Railways Company, which was threatened when the company announced a decrease of one cent an hour on May 1, has been averted by the appointment of a third arbitrator to consider the question. Two arbitrators were appointed several weeks ago to decide on the wage scale for the coming year, but they failed to select a third. Following the notice of the decrease issued on May 1 representatives of the company and the car men held a conference and decided on Judge J. J. Miller of the Allegheny county court. The other two members of the board of arbitration are M. K. McMullin, representing the company, and Calvin Wyatt, representing the union. The decrease has been postponed until May 9 and both sides are pledged to abide by the decision of the board.

Controversy over Car License Fees.—The city of Chicago and the Chicago & Oak Park Elevated Railroad are engaged in a controversy over the payment of car license fees. On Monday of this week the company sent a check for $4,800 to the city collector as payment of the $50 fee on 96 cars in regular use. The check was returned with a demand for payment on the company's entire equipment of 163 cars and a threat that if the amount were not paid within three days the company would not be allowed to use the Lake street bridge. Clarence A. Knight, president of the road, promptly returned the check, stating that the company's franchise only required it to pay on the cars in regular use and that the question is now in litigation before a master in chancery. The city council committee on track elevation has under consideration an ordinance compelling the company to elevate its tracks from Fifty-second avenue to the city limits.

No Federal Arbitration of Chester Strike.—The commissioner of labor and Martin A. Knapp, chairman of the interstate commerce commission, have announced that they have no authority to appoint a board of arbitration under the Erdman labor law to settle the strike of the motormen and conductors of the Chester (Pa.) Traction Company. Representatives of the strikers went to Washington last week to ask for such a settlement, but after a conference on May 1 it was decided that the federal government has no jurisdiction in the case because the company is chartered under the street railroad act of Pennsylvania, although its tracks extend to Wilmington, Del. Governor Stuart of Pennsylvania has stated that he has no jurisdiction in the matter except to preserve peace as far as possible by sending the state militia to Chester. President Rigg of the Chester Traction Company has declined to arbitrate, saying that the reduction of wages from $18\frac{1}{2}$ to $16\frac{2}{3}$ cents an hour was made necessary by the decrease in earnings. The cars are being run on schedule but are carrying few passengers.

Recent statistics prepared by a committee of the Master Car Builders' Association show that over 60 per cent of the removals of wheels were for flange wear or flange failures.

Traffic and Transportation

Traffic on Washington Baltimore & Annapolis Line Exceeds Expectations.

Traffic on the Washington Baltimore & Annapolis Electric Railway since the formal opening of the line has exceeded all expectations. That this situation exists is a great tribute to the attractiveness of the electric service, which must meet the competition of the numerous steam railway trains operated between Baltimore and Washington. Up to this time the Washington Baltimore & Annapolis road has operated cars on an hourly schedule between Washington and Baltimore, but it is now expected to increase the service so that a car will be run every half hour between Baltimore and Washington between the hours of 6:30 a. m. and 7:30 p. m., beginning on May 10.

Fare Announcement.

The Waverly Sayre & Athens Traction Company of Waverly, N. Y., has made the following announcement:

"Commencing on May 1, 1908, one fare of five cents will transport a passenger to any point in the village of Waverly, N. Y., and the boroughs of Athens, Sayre or South Waverly, Pa., with the privilege of one transfer. A special commutation ticket will be sold by the conductors, 44 tickets for $2.00; good for transportation between the hours of 5:30 and 7:30 a. m. and 5 to 7 p. m., with transfer privilege. One of these tickets will transport a passenger to any point on the line in the four towns. Transfers must be asked for at the time fare is paid to the conductor. These rates of fare compare favorably with those in the largest cities in the country, it being possible to ride nine miles for five cents."

Freight Handling in Montreal.—The council of the board of trade of Montreal has decided to urge the city council of that city to grant to the Montreal Street Railway the privilege of handling freight in the streets under such restrictions as would prevent interference with passenger business or the ordinary street traffic.

Transfers Limited in Philadelphia.—The board of directors of the Philadelphia Rapid Transit Company has issued an order stating that on and after May 18 the company will issue free transfer tickets only upon the payment of a 5-cent fare and only at the time the 5-cent fare is paid, when requested by the passenger.

Complaint Regarding Freight Rates.—The New York public service commission, second district, has been asked to investigate the freight rates charged by the United Traction Company of Albany between Albany, Troy, Watervliet and other near points and by the Electric Express Company. The commission has served a copy of the complaint upon the companies and has asked them to answer within 20 days from April 28.

Philadelphia Rapid Transit Company Handling Milk Traffic.—Under the provisions of the trolley freight bill passed by the last legislature of Pennsylvania the Philadelphia Rapid Transit Company has begun the operation of a car to carry cans of milk. The car starts from Doylestown, Pa., at 6:24 a. m. The rate charged is 12 cents for a 30-quart can. The rate charged by the Philadelphia & Reading Railway, a steam road, is 15 cents for a can of the same size.

Elevated Road Traffic in Chicago.—The Northwestern Elevated Railroad of Chicago carried a daily average of 103,569 passengers in April, 1908, an increase of 13,434 over the corresponding month of last year. The South Side Elevated Railroad carried a daily average of 117,889 passengers in April, an increase of 14,753 over the corresponding month of last year. The Metropolitan West Side Elevated Railway carried a daily average of 146,638 passengers, a decrease of 9,627 from April, 1907.

Hearing on Coney Island Fare.—At the inquiry before the New York public service commission, first district, on April 27, regarding the 10-cent fare charged by the Brooklyn Heights Railroad to Coney Island, testimony was offered by Howard Abel, comptroller of the company, to show that the road lost $141,769 in the operation of its lines in 1907 and that a reduction of the fare from 10 cents to 5 cents would add to the annual loss. Mr. Abel said that the larger part of the territory through which the lines of the company extend is unsettled and that the average number of passengers carried per car is small. He said that if the company averaged 50 passengers per car between terminals it could afford to carry passengers the entire distance for 5 cents and would make an annual profit of over $230,000.

Construction News

FRANCHISES.

Baltimore, Md.—The right of the Maryland Electric Railways Company to use the tracks of the Baltimore & Ohio Railroad in entering Baltimore with its interurban line without securing a terminal franchise has been sustained by the board of estimate. The company was authorized to lay tracks on Russell street for a distance of three blocks. A park tax of 9 per cent amounting to $65 per year will be paid for the privilege.

Brooklyn, N. Y.—The New York & Queens County Railway Company has filed notice of intention to extend its line from its tracks on Jackson avenue, in the borough of Queens, opposite the bridge plaza of Blackwell's Island bridge, and thence along the bridge plaza and approach across the bridge to the borough of Manhattan.

Calgary, Alberta, Can.—P. A. G. Roderique has applied to the city council for a franchise to operate a street railway in Calgary.

Farmingdale, L. I.—The Nassau county supervisors have granted the Huntington Railroad Company an extension of time to May 1, 1909, for beginning work on its line along Main street, Farmingdale, a county road, and until May 1, 1910, in which to complete the road under the franchise granted by the board on November 3, 1906. The road will be a cross island route from Huntington to Babylon, L. I.

Littleton, Colo.—Pending the passing of a franchise ordinance the town council of Littleton has granted permission to the Denver & South Platte Railroad Company to construct its line through that town, work on which will be started immediately. The road later will be extended to Roxbury Park and Colorado Springs. W. E. Hughes of Denver is president.

Oakland, Cal.—It is stated that the San Francisco Oakland & San Jose Railway Company will apply for a franchise for the extension of its lines to Twelfth and Union streets, where a station will be erected.

Piedmont, Md.—A 50-year franchise has been granted to the Potomac Valley Railway Company for the operation of its proposed interurban line in Piedmont, where the headquarters of the company are located. Louis Trabe and others of Wheeling, W. Va., are interested. (Noted April 11.)

Portland, Ore.—The F. B. Holbrook Company has applied for a franchise to construct and operate a single-track electric railway in Portland from East Thirtieth and Alberta streets north of East Thirtieth street to Ainsworth avenue and through the Irvington Park addition, six blocks. It is understood that this will be part of the Portland Railway Light & Power system and that transfers between the two lines will be exchanged.

Springfield, Mass.—The Springfield Street Railway Company has secured franchises for spurs on Hickory street, on State street at Federal street and on State street at the Highland brewery, all being for the purpose of establishing a trolley freight business.

RECENT INCORPORATIONS.

Cochise County Electric Railroad.—Incorporated in Arizona to build an electric railway from Bisbee to Douglas, Ariz. Capital stock, $500,000. Incorporators: James S. Douglas, W. H. Brophy, M. J. Cunningham, M. J. Brophy and George H. Neale.

Indianapolis Frankfort Delphi & Chicago Traction Company, Frankfort, Ind.—Incorporated in Indiana to succeed the Frankfort Delphi & Northern Traction Company, which was incorporated in January, 1907, to build an electric railway from Frankfort, Ind., to Chicago, Ill., by way of Delphi, Monticello, Monon and Hammond. The new company will improve the water power at Monticello, which will be used to generate power for the operation of the proposed line. Capital stock, $100,000. W. H. Cohee, Frankfort, Ind., was vice-president and general manager of the earlier organization.

Oklahoma-El Reno Interurban Traction Company.—Incorporated in Oklahoma to build an interurban railway from Oklahoma City to El Reno. It is stated that work will be started immediately on the construction of the line. Capital stock, $2,000,000. Incorporators: Howard M. Hyatt, A. M. Spencer, Stephen Brown, Joseph Brown and J. A. Stevenson, all of Oklahoma City.

Valley Power Company.—Incorporated in Oregon to construct an electric railway from West Woodburn through Monitor to Scott Mills and on to Wilhoit Springs, Ore. It is stated that work will be started this month. Capital stock, $100,000. Incorporators: Frank Robertson, Charles H Carey and William S. Turner of Portland, Ore.

Wheeling & Western Traction Company, Cleveland, O.—Incorporated in Ohio to operate street railways in Urichsville, Dennison, Bridgeport, Cambridge, Steubenville, Zanesville, Bellaire and Louis Mills, O. Capital stock, $1,000. Incorporators: A. Evans Townsend, T. H. Bierbach, Josiah Wolf, Nathan Fronstine and Herbert Goldpaden.

TRACK AND ROADWAY.

Alabama Railway & Electric Company, Opelika, Ala.—It is reported that this company proposes to build an electric railroad from Opelika to Eufaula, Ala., 55 miles. Judson C. Chapman of Atlanta, Ga., is interested.

Belleville & Pinckneyville Traction Company.—It is reported that this company has practically completed its surveys and estimates and proposes to begin construction at an early date on its proposed line from Belleville to Pinckneyville, Ill., 46 miles. The officers are: President, L. D. Turner, Belleville; vice-president, C. R. Hincke; secretary, George F. Meade; treasurer, J. A. Hamilton, Marissa Ill.; chief engineers, Harpe Brothers, East St. Louis, Ill.

Bennington & North Adams Street Railway, Hoosick Falls, N. Y.—It is reported that this company will expend $100,000 for repairs and improvements on its line.

Birmingham (Ala.) Railway Light & Power Company.—An interlocking plant has been established at the crossing of the Louisville & Nashville Railroad tracks at First avenue and Twenty-ninth street in Birmingham.

Connecticut Company, New Haven, Conn.—The Massachusetts railroad commission has approved the route and the method of construction for the proposed line from Hartford to Middletown, Conn. The directors have voted not to build the line this year but the preliminary work will be disposed of as far as possible. Most of the right of way has been secured (Noted May 2.)

Crown Point, Ind.—Herman E. Sasse writes that the business men of Crown Point have secured a 50-foot right of way from Crown Point to Gary, Ind., 11 miles, which they are ready to donate to any company which will build an interurban railway connecting either Gary or Hammond and Crown Point before May 1, 1910. The property is held by three trustees, John Brown, W. G. Woods and H. E. Sasse, who also have a franchise over the Lake county highways. The county commissioners have appropriated $37,500 for the construction of a concrete bridge over the Little Calumet river at Crown Point, which could be used by an electric line. The Gary & Hobart Electric Railway and H. W. Seaman have applied for the right of way.

Drake's Branch, Va.—It is reported that surveys are being made for an electric railway from Drake's Branch on the Southern Railway, via Charlotte Court House, to a connection with the Virginian Railway.

Greenville & Carolina Railway, Greenville, N. C.—This company has been organized to build an electric railway from Asheville to Greencastle, N. C., 70 miles. At a meeting held last week officers were elected and it was decided to begin construction in August. The contract will be awarded to the Carolina Construction Company. T. E. Smith is president and L. W. Walker secretary and treasurer.

Huron (S. D.) Gas & Electric Railway Company.—This company is making surveys for its proposed line from Huron to Aberdeen, S. D.

Interstate Consolidated Street Railway, Attleboro, Mass.—It is reported that this company has let a contract to Eveline Brothers of Attleboro for the construction of an extension from Thacher street to Washington street, South Attleboro.

Jeannette Montclair & Woodland Traction Company, Washington, D. C.—A stockholders' meeting has been called for May 12 to reorganize this company, which proposes to build an electric railway from Woodland to Brawley, Cal. Construction is to be started this summer. A contract for grading and excavation has been awarded to John Hahwood of Brawley and work is to be started this summer. The officers are: President, Albert Mollizal; vice-president, Ladd Veitt, Tulsa, Okla.; treasurer, Bruce Clark, El Reno, Okla.; secretary and manager, A. E. Culley, 407 Hudson street, New York, N. Y.

Kansas City (Mo.) Railway & Light Company.—Work on the extension of the Tenth street line is nearly completed. The track has been laid, the overhead work is in progress and it is stated that the line will be in operation in a few days.

Kansas-Colorado Power & Railroad Company.—A. B. Hulit representing the Northern Electrical Company of Madison, Wis., is seeking to interest several towns in the Arkansas Valley in a project to construct a large electric power system serving the entire valley and an electric road connecting Canyon City, Pueblo, Rocky Ford and La Junta, Colo., with Dodge City, Kan. It is proposed to erect a large power plant near Canyon City.

Lake Erie & Youngstown Railroad, Youngstown, O.—It is reported that financial arrangements have been made for building this proposed line from Youngstown to Conneaut, O., 60 miles, and that 75 per cent of the right of way has been obtained. John H. Ruhlman is president and George Tod, Jr., is chief engineer. (Noted September 7, 1907.)

Louisville (Ky.) Railway.—It is reported that this company is considering a plan to extend the Okolona line to Washington, Ky., 16 miles. T. J. Minary is president and general manager.

Little Rock & Hot Springs Electric Railway, Little Rock, Ark.—L. Garrett, vice-president and general manager, writes that conditions are favorable for beginning construction within 90 days on the proposed line from Little Rock to Hot Springs, Ark., 56 miles, including three miles of city line in the two cities. Contracts have not yet been let. The road will serve a population of 250,000 and will be built and equipped for handling freight and passenger traffic. C. J. Kramer, 319 Main street, Little Rock, is president; J. C. Marshall, secretary; G. W. Rogers, treasurer; P. M. Pierce, electrical engineer. (Noted May 2.)

Manchester (Ky.) Traction Company.—It is reported that this company has been organized to build an electic railway from Manchester to Barboursville, Ky., 25 miles. Right of way has been secured. Louis des Cognets, Lexington, Ky., is president.

Marquette Negaunee & Ishpeming Interurban Railway, Marquette, Mich.—This company is preparing to begin construction this spring on its proposed line connecting Marquette, Negaunee and Ishpeming, Mich., 14 miles. The site for the power house has not yet been chosen. L. M. Sigler, Cleveland, O., is president; J. W. Barber, Cleveland, is secretary. The Roberts & Abbott Company, Cleveland, is acting as consulting engineer.

Mattoon Shelbyville Pana & Hillsboro Traction Company.—W. R. Patton, president, Charleston, Ill., writes that this company proposes to build an electric railway from Mattoon to Hillsboro, Ill., 68 miles, via Windsor, Shelbyville, Nokomis, Pana and Witt. Surveys have been completed but it has not been definitely decided when construction will begin. (Noted April 18.)

Milwaukee & Fox River Valley Electric Railroad, Fond du Lac, Wis.—It is reported that this company has agreed to complete the line from Plymouth to Elkhart, Wis., by July 1. J. M. Saemann of Sheboygan is president. (Noted February 29.)

Mt. Hood Railway & Power Company, Portland, Ore.—Construction on the line from Portland to Bull Run, Ore., has been suspended temporarily on account of a dispute in regard to the right of way near Gresham. (Noted May 2.)

Omaha & Council Bluffs Street Railway, Omaha, Neb.—It is announced that the route for the proposed extension of the Manawa line to the Iowa School for the Deaf has been finally decided. Right of way has been secured, plans have been prepared and construction is to be started this summer (Noted March 28.)

Paul's Valley, Okla.—Scott Jones is said to be interested in a project to build an electric railway from Paul's Valley to Anadarko via Chickasha and Lindsay.

Pendleton, Ore.—It is reported that W. H. Coe of Portland, Ore., is interested in a project to build an electric railway from Pendleton to Irrigon, Ore., and that surveys are now being made.

Schenectady (N. Y.) Railway.—It is announced that this company will double-track the Broadway line in Schenectady from Campbell avenue to Guilderland avenue and also a short portion of the Campbell avenue line.

Spokane & Inland Empire Railroad, Spokane, Wash.—It is reported that surveys are being made for a branch line from

Steptoe, Wash., to the summit of Steptoe butte, about four miles.

Terre Haute Indianapolis & Eastern Traction Company, Indianapolis, Ind.—John J. Appel, vice-president, and C. C. Reynolds, general manager, are reported to have announced that plans are now being considered for the proposed extension from Crawfordsville, Ind., to Danville, Ill. County franchises have been secured.

Washington Westminster & Gettysburg Railroad, Washington, D. C.—James B. Colegrove, president, writes that surveys have been completed for the proposed line from Washington, D. C., to Gettysburg, Pa., 90 miles, via Sandy Spring, Laytonsville, Damascus, Mt. Airy, Westminister and Littlestown. Contracts are to be let for the entire construction and grading is to be started this summer. The maximum grade will be 1½ per cent and the maximum curvature 4 degrees except in towns. It is proposed to use 70-pound T-rails. The road would accommodate a large excursion traffic and traverse a rich agricultural region. A. A. Chapin is vice-president and W. Atlee chief engineer. (Noted April 18.)

Wellsburg Bethany & Washington Traction Company, Wellsburg, W. Va.—Work was started this week in Bethany on the city portion of the line from Wellsburg to Bethany, W. Va., seven miles, and it is stated that the road will be in operation this month. T. E. Cramblett of Bethany is president.

West Chester & Wilmington Electric Railway, West Chester, Pa.—This company has awarded a contract to the Eastern Railway Construction Company for the construction of its proposed line from West Chester, Pa., to Wilmington, Del., 16½ miles. Surveys have been completed and construction is to be started at once. Thomas E. O'Connell, president. (Noted April 11.)

Winona Interurban Railway, Winona Lake, Ind.—S. C. Dickey, general manager, has announced that the Winona-Warsaw line should be ready for operation by July 4. The grading between Akron and Warsaw is nearly completed and tracklaying is to begin at an early date. (Noted April 11.)

Yakima Valley Transportation Company, North Yakima, Wash.—This company, which recently completed a 3-mile electric road in North Yakima, has announced plans for the construction of a system of lines amounting to about 70 miles in the Yakima valley. Preliminary surveys have been made and a portion of the capital has been subscribed. The plans include a line to the state fair grounds southeast of the city to be built this year, which is to be extended to Yakima City, Parker and Zillah and eventually to Granger and Sunnyside, Wash.; a line running southeast of the city for about 12 miles through the Moxee valley, and another extension of the present line to Ahtanum, six miles. A. J. Splawn is president and G. S. Rankin vice-president and general manager. (Noted January 4.)

POWER HOUSES AND SUBSTATIONS.

Virginia Passenger & Power Company, Richmond, Va.—This company contemplates the expenditure of about $70,000 for a substation on Church Hill. (Noted February 8.)

Winchester & Washington Railway.—S. H. Hansbrough, president of this company, which owns and operates a large power plant on the Shenandoah river at Millville, Va., and supplies light and power to Winchester, Berryville and Charlestown, is reported as announcing that the capacity of the plant will be doubled at once. It is stated that contracts for $50,000 worth of additional machinery have been let for installation in July. The plant will then have a capacity of about 3,000 horsepower.

Milwaukee Light Heat & Traction Company, Milwaukee, Wis.—It is announced that this company will begin the construction of a temporary power station at Watertown, Wis., to care for the operation of the electric line now building from Oconomowoc to Watertown. This work is preliminary to the construction of a large power plant to be erected next year for the operation of all the lines radiating from Watertown, estimates on which are being made by Davidson, Rau & Kahill, engineers at Milwaukee.

Greenville & Carolina Railway, Greenville, S. C.—It is stated that this company, recently organized to build a 70-mile interurban line from Greenville, S. C., to Hendersonville and Asheville, N. C., will build a water power electric plant which will develop about 6,000 horsepower for the transmission of electricity to operate its lines and various electric light plants in that section. The contract has been awarded to the Carolina Construction Company of Asheville, N. C., which will start construction work in the near future. T. E. Smith, Greer, S. C., is president of the railway company.

Personal Mention

Mr. J. F. Lardner, vice-president and general manager of the Tri-City Railway at Davenport, Ia., has resigned to engage in other business in Davenport.

Mr. Henry J. Davies, secretary of the Cleveland Electric Railway, has been elected treasurer also and will be the active representative of the company in Cleveland.

Mr. Grant Buchanan has been appointed assistant superintendent and chief dispatcher of the Chicago Lake Shore & South Bend Railway at South Bend, Ind. Mr. Buchanan formerly was superintendent of construction of the Youngstown & Ohio River Railroad at Youngstown, O.

Mr. A. J. McAndrews has been appointed master mechanic of the Bloomington lines of the Illinois Traction System, with headquarters at Bloomington, Ill., effective at once. Mr. McAndrews formerly was connected with the Indianapolis & Cincinnati Traction Company at Rushville, Ind.

Mr. Henry Haigh has been elected president of the Cincinnati Georgetown & Portsmouth Railroad, Cincinnati, O., succeeding the late A. W. Comstock. Mr. Haigh is a well-known railway builder and is at present engaged in the construction of the extension of the Milwaukee Northern Railway from Port Washington to Sheboygan, Wis.

Mr. R. W. Cooke has been appointed superintendent of the Municipal Traction Company of Cleveland, O. He succeeds Mr. George L. Radcliffe of the Cleveland Electric Railway, which has been leased to the Municipal Traction Company. Mr. Cooke has been superintendent and chief engineer of the Forest City Railway. Mr. Lawrence Crecelius has been appointed superintendent of power. Mr. Terrance Scullin, master mechanic of the Cleveland Electric Railway, has been retained by the Municipal Traction Company.

Mr. A. B. du Pont, president of the Municipal Traction Company, which, by the recent settlement, now operates under a lease all the street railway lines in Cleveland, was born in Louisville, Ky., on April 26, 1865. Mr. du Pont comes from a family long identified with street railroads, an uncle, A. V. du Pont, and his father, Bidermann du Pont, having had large holdings for many years in the street railway lines of Louisville and other large American cities. Mr. du Pont graduated from the Rensselaer Polytechnic Institute of Troy, N. Y., at the age of 21 years, and for a short time was engaged as a mining engineer. Desiring to enter street railway work he went to Louisville, Ky., where he was employed in the track department of the city lines on construction and maintenance.

A. B. du Pont.

At this time Tom L. Johnson, a friend of the family and the present mayor of Cleveland, was associated with the lines in Brooklyn, N. Y., and at his solicitation Mr. du Pont went to that city to engage in the construction and equipment of the cable lines. After completing this work he was placed by his uncle, A. V. du Pont, in charge of the reconstruction and equipment for electrical operation of the Louisville lines, during which time he designed and built power houses and invented several railway appliances, among them the du Pont truck. He then engaged in similar work in Detroit and later, when all the lines of that city were consolidated, he was appointed general manager of the combined properties. He subsequently became vice-president and general manager of the St. Louis Transit Company, where he was engaged for three years in reconstructing and equipping the lines for electrical operation. He also designed and installed the large terminals for handling the crowds at the St. Louis world's fair in 1904. In 1905 he resigned from this position with the intention of retiring from active business connections. The traction difficulties in Cleveland, however, under the leader-

ship of Mayor Johnson, have since occupied his attention and, as earlier stated, their adjustment has resulted in the Municipal Traction Company being in control of all the lines of that city with Mr. du Pont as president.

Mr. L. R. Gaw, for the past year master mechanic of the Ohio Central Traction Company at Gallion, O., has resigned to accept a similar position with the Saginaw-Bay City Railway & Light Company at Saginaw, Mich., succeeding Mr. William Long, resigned, as noted in the Electric Railway Review of May 2. Mr. Gaw formerly was with the Toledo & Indiana Railway.

Mr. J. C. Gillette, who has been in charge of the engineering work for the Roberts & Abbott Company of Cleveland, O., in connection with the overhead construction of the Washington Baltimore & Annapolis Electric Railway, Baltimore, Md., has been appointed electrical engineer of that road, effective at once. Mr. Gillette formerly was electrical engineer for the Columbus Delaware & Marion Railway at Delaware, O.

Mr. H. R. Fothergill, heretofore general superintendent of the Greenville (S. C.) Traction Company and superintendent of the Greenville Gas & Electric Light & Power Company and the Paris Mountain Water Company, has resigned to re-enter the contracting business. Mr. Fothergill has been connected with electric railway and lighting properties for the past 15 years, having been particularly engaged in power plant construction.

Mr. J. G. Huntoon, heretofore superintendent of transportation of the Tri-City Railway at Davenport, Ia., has been appointed general superintendent of the company, with entire charge of the operation of the lines of that road. Mr. Huntoon was born in Rock Island, Ill., and has been connected with the Tri-City company in various departments for the past 20 years. He succeeds Mr. James F. Lardner, whose resignation is announced elsewhere.

Mr. C. E. A. Carr, heretofore manager of the Helena Light & Railway Company, Helena, Mont., has resigned to become managing director of the Quebec Gas Railway & Electric Light Company of Quebec, Canada. Mr. Carr had been connected with the Helena property since 1905, when he was engaged by J. G. White & Co. as manager with entire charge of the construction and reconstruction work on the property in 1906 and 1907. He was born at Thornton, Ont., in 1870 and was actively engaged in street railway work in Canada for several years, having had charge of the conversion of the London (Ont.) Street Railway from horsepower to electricity in 1905, and holding at the same time the position of general manager and secretary of the Montreal Park & Island Railway, a 40-mile suburban road operating between Montreal and Quebec.

OBITUARY.

A. W. Comstock, formerly president of the Cincinnati Georgetown & Portsmouth Railroad, Cincinnati, O., died on Thursday, April 30.

Pay-As-You-Enter Cars Give Satisfaction in New York.

The new pay-as-you-enter cars which were placed in service in New York on March 21 are giving entire satisfaction, according to a recent statement by Oren Root, general manager for the receivers of the New York City Railway.

"Passengers are co-operating with us, by having the exact fare ready to hand the conductors upon entering the cars," said Mr. Root, "and the signs on the sides of the cars, calling the attention of the public to this requirement, have helped as a constant reminder. We have had few complaints about the new cars, and I can hardly class as complaints those we have received from men that the steps are too high, particularly for short, stout people. This was one of the first deficiencies we noticed ourselves, and, as the cars are an experiment with us, we have been giving them close attention.

"On 65 of the 155 cars installed we have already lowered the steps $2\frac{1}{2}$ inches, which is lower than the steps on the standard closed cars in operation on the other lines. The steps on the remaining number will be lowered within the next two weeks. We have found the doors are a little too narrow, and this defect will be remedied in the next lot of cars we shall order. They will be made wider than those of the present cars by $1\frac{3}{4}$ inches, which is sufficient to meet all requirements. We contemplate placing an order for 150 more of these cars, which we shall probably run on the Eighth avenue line.

"We may say that the new cars are a great success, and they certainly facilitate the loading and unloading of passengers."

Financial News

American Light Heat & Traction Company, New York.—Earnings on the stock of subsidiary companies in the quarter ended March 31, 1908, were $600,163, as compared with $571,549 in the corresponding quarter of 1907. Miscellaneous earnings were $58,630, as compared with $56,496; net earnings available for distribution were $617,093, as compared with $616,015. After provision for accrued dividends, the surplus for the quarter was $332,140, as compared with $317,963. A deduction of $176,500 was made for reconstruction reserve in each quarter.

Augusta-Aiken Railway & Electric Company, Augusta, Ga.—Stuart F. Knott, Gordon N. Buck, W. S. Johnson, J. H. Hellen and C. C. Tegethoff have been elected new directors to succeed W. T. Van Brunt, D. S. Herdy, H. B. Parson and W. P. Gardiner. This company controls the Augusta Railway & Electric Company, the Augusta & Aiken Railway and other properties.

Boston & Northern Street Railway, Boston, Mass.—This company has asked the Massachusetts railroad commission to approve the issue of $1,250,000 of 6 per cent cumulative preferred stock.

Camden & Trenton Railway, Camden, N. J.—Protective committees representing bondholders of this company, the Trenton & New Brunswick Railroad and the New Jersey Short Line Railroad met on April 16 in Philadelphia and decided to retain Ford, Bacon & Davis of New York to examine the properties and report what improvements will be necessary to enable profitable operation. A majority of each class of bonds has been deposited with the West End Trust Company of Philadelphia.

Chicago & Milwaukee Electric Railroad.—George G. Moore of Detroit has been appointed one of the receivers for this road to succeed H. A. Haugan, president of the State Bank of Chicago. The issue of $1,000,000 of receivers' certificates, the proceeds of which will be used to complete the construction of the line to Milwaukee, has been purchased by the Investment Registry, Limited, of London, which had previously acquired an interest in the bonds of the Chicago & Milwaukee Electric Railroad of Wisconsin. The certificates were purchased at 95.

Evansville (Ind.) Terminal Railway.—An issue of $200,000 of an authorized amount of $300,000 of first mortgage 30-year 5 per cent bonds has been made. The bonds are offered for sale at 90 and interest, with a bonus of 30 per cent in 6 per cent cumulative preferred stock of the Evansville Railways Company. The latter owns the outstanding stock of the Terminal railway and guarantees principal and interest of the bonds. The bonds are described as follows: "The $200,000 bonds are issued for the purpose of providing funds with which to construct a line between Evansville and Newburg, Ind., nine miles; the line to be operated by both electricity and steam. It is proposed to lease the present property belonging to the Evansville & Eastern Electric Railway, in operation between Newburg and Rockport, 21 miles, and to operate the lines as one system, together with the line west to Mt. Vernon, Ind.; total mileage, 48 miles. The business at present handled by the Evansville Suburban & Newburg Railway for the account of the Evansville & Eastern road shows annual business amounting to $23,152 and cost of operation, $6,280. The Evansville Railways Company owns all of the stock of the Evansville & Mt. Vernon Electric Railway and 98 per cent of the outstanding stock of the Evansville & Eastern Electric Railway, besides the total capital stock of the Evansville Terminal Railway. The company has $1,000,000 common stock and $500,000 preferred stock. It has no bonded debt and has not heretofore guaranteed bonds of either of the other roads owned by it."

Fairmont & Clarksburg Traction Company, Fairmont, W. Va.—The authorized stock of this company has been increased from $2,000,000 to $5,000,000.

Hartford & Springfield Street Railway, Hartford, Conn.—The directors deferred the usual semi-annual dividend due in May, on account of business conditions and the existence of a floating debt of $40,000. An explanatory statement by the company to shareholders said that it was inadvisable to attempt at present to dispose of securities to provide for the payment of this debt. While nearly all of the electric railways in New England have shown a decrease in passenger revenue for the first quarter of this year, this company, the statement said, showed an increase for each of the three

months. In the quarter gross earnings amounted to $32,051,98, as compared with $30,359.45 in the first three months of 1907. The statement added further that it was believed that earnings in 1908 would be materially larger than in any previous year, and the directors expressed the hope that the earnings would be sufficiently large to warrant payment of the deferred dividend at a later date.

Hudson Valley Railway, Glens Falls, N. Y.—Gross earnings for the quarter ended March 31, 1908, were $112,300, as compared with $107,884 for the corresponding quarter of the previous year. Operating expenses were $107,103, as compared with $103,602. The final deficit, after meeting fixed charges, was $60,050, as compared with $43,959.

Northern Texas Traction Company, Ft. Worth, Tex.—An amendment to the charter authorizing an increase in the capital stock from $2,500,000 to $3,000,000 has been approved by the authorities of Texas.

Old Colony Street Railway, Boston, Mass.—Application has been made to the Massachusetts railroad commission for approval of an issue of $750,000 of 6 per cent cumulative preferred stock.

Philadelphia Company, Pittsburg.—Gross earnings for the quarter ended March 31, 1908, were $4,662,060, as compared with $5,102,113 in the corresponding quarter of the previous year. Expenses and taxes were $2,838,799, as compared with $2,947,214, and net earnings were $1,823,261, as compared with $2,154,899 in the 1907 quarter.—Gross earnings of the Philadelphia Company and affiliated corporations for the year ended December 31, 1907, were $19,082,099. Operating expenses and taxes were $9,668,328. Net earnings were $9,413,771. From the net income of $5,061,060 there was deducted $2,136,726 for improvements, betterments and extraordinary expenses.

Portland (Ore.) Railway Light & Power Company.—This company has acquired the properties of the subsidiary Portland Railway Company, Oregon Water Power & Railway Company and the Portland General Electric Company.

Public Service Corporation, Newark, N. J.—Thomas N. McCarter, the president, states: "The directors have authorized the execution of a first mortgage upon all the property of the corporation, securing an issue of $50,000,000 of 5 per cent bonds, dated May 1, 1908. The mortgage is designed to provide a complete financial scheme for the company for years to come. It covers all the real estate, the leases of gas and electric properties, and pledges as security thereunder all the shares and bonds of underlying companies. By the terms $3,725,000 bonds are to be delivered by the trustee to recoup the company for betterments recently made and contracted for; $7,250,000 bonds are reserved for retiring a like amount of collateral gold notes, dated November 1, 1904; $6,250,000 bonds are reserved for retiring a like amount, or so many thereof as may not have been converted, of the convertible notes, dated April 16, 1906. The remainder of the issue is reserved under most carefully restricted provisions for future betterments. After delivery of the $3,725,000 bonds no future bonds can be delivered by the trustee unless there be delivered to the trustee a certificate, verified by affidavit, that so far as any portion of said issue up to $25,000,000 is concerned, the earnings from the leased properties mortgaged and the income from pledged securities for the 12 calendar months

ELECTRIC RAILWAY EARNINGS.

	Gross earnings.	Operating expenses.	Net earnings.	Total charges.	Surplus.

*Includes miscellaneous income.

next preceding the date of the certificate exceed by 33⅓ per cent the interest on all the bonds issued under said mortgage, plus interest on the bonds, the certification and delivery of which is desired; and that so far as the issue of the remaining $25,000,000 bonds is concerned, there must be delivered to the trustee a certificate, verified by affidavit, that earnings from the leased properties mortgaged and the income from pledged securities for the 12 calendar months next preceding the date of the certificate, exceed by 50 per cent the interest on the bonds issued under said mortgage, plus interest on the bonds, the certification and delivery of which is desired. Not more than $25,000,000 bonds can be delivered under the mortgage prior to January 1, 1911, and thereafter not more than $4,500,000 bonds can be issued in any one year for betterments, except that this last provision is cumulative."

Rutland (Vt.) Railway Light & Power Company.—G. T. Rogers, the president, has issued a statement to holders of stock and bonds saying that the final consolidation of the Rutland properties has been completed, and giving a balance sheet as of April 1, 1908, together with the figures of earnings for the year ended March 31, 1908, with comparisons. The railway earnings and earnings of the consolidated properties for three years have been as follows:

Railway—	Earnings.	Expenses.	Net.
1906	$ 93,726.22	$ 55,369.97	$ 38,356.25
1907	105,154.55	56,003.09	49,151.46
1908	105,484.93	58,213.43	47,271.50
Consolidated—			
1906	180,026.08	115,189.98	64,836.10
1907	222,019.41	130,454.89	91,564.52
1908	254,835.18	144,379.29	110,455.89

Mr. Rogers states: "Notwithstanding the splendid increase in both gross and net receipts, all indications point to a still further increase, as the company has entered into a number of contracts for power with some of the largest consumers in this section."

Sheboygan (Wis.) Light Power & Railway Company.—This company has executed a lease whereoy it takes over for a period of 25 years the section projected by the Milwaukee & Fox River Valley Railway between Plymouth and Elkhart Lake, Wis. Ernest Gonzenbach, general manager of the Sheboygan company, states that this section will be rushed to completion.

Springfield (Mass.) Street Railway.—The Massachusetts railroad commission has approved the issue of $500,000 additional capital stock, making the total outstanding $2,758,100. The proceeds will provide for floating debt and additions to property.

Toledo Urban & Interurban Railway, Toledo, O.—We are advised by an official of this company that there is no truth in a report that the joint operation of the Toledo Urban & Interurban Railway and the Toledo Bowling Green & Southern Traction Company will be abandoned and the Ohio Electric Railway will acquire an interest in the former property.

Union Electric Company, Dubuque, Ia.—A block of $125,000 of first mortgage 5 per cent bonds, due on May 1, 1924, is offered for sale by Perry, Coffin & Burr, Boston. Gross earnings of the company in 1907 were $294,922 and net earnings were $90,448. Interest amounted to $32,500, leaving a surplus of $57,948.

United Traction Company, Albany, N. Y.—Gross earnings in the quarter ended March 31, 1908, were $453,777, as compared with $456,644 in the corresponding quarter of the previous year. Operating expenses were $323,799, as compared with $292,621. Net earnings were $129,978, as compared with $164,023. Other income was reduced and charges were a little higher, so that the final surplus was $71,343, as compared with $114,183.

Vicksburg (Miss.) Railway & Light Company.—The property of this company was sold at auction on May 4 at Vicksburg to H. S. Bullis of Olean, N. Y., for $50,000.

Dividends Declared.

Columbus (O.) Railway, preferred, quarterly, 1¼ per cent.

Connecticut Railway & Lighting Company, New Haven, Conn., common, assenting, quarterly, 1 per cent; non-assenting, quarterly, 0.15 per cent; preferred, quarterly, 1 per cent.

Dartmouth & Westport Street Railway, New Bedford, Mass., quarterly, 2 per cent.

Ohio Traction Company, Cincinnati, O., preferred, quarterly, 1¼ per cent.

Tampa (Fla.) Electric Company, 3½ per cent.

Union Street Railway, New Bedford, Mass., quarterly, 2 per cent.

Manufactures and Supplies

ROLLING STOCK.

Spokane Traction Company, Spokane, Wash., has ordered four double-truck cars from the St. Louis Car Company.

Marion Bluffton & Eastern Traction Company, Bluffton, Ind., has ordered one 18-bench open car from the Cincinnati Car Company.

Snohomish Valley Railway, Snohomish, Wash., is in the market for three direct-current interurban cars, three trailers and one express car.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind., has ordered 10 closed cars and one portable substation car from the Cincinnati Car Company.

Pittsburg & Butler Street Railway, Pittsburg, Pa., which was reported in the Electric Railway Review for May 2 to have placed an order with the Cincinnati Car Company for two cars, has ordered four combination passenger interurban cars from this company.

SHOPS AND BUILDINGS.

Texas Traction Company, Dallas, Tex.—It is reported that this company has leased a lot, 47 by 200 feet, on Commerce street, Dallas, and will build a station on it.

TRADE NOTES.

Railway Materials Company, Chicago, has moved its New York office to the Singer building.

Quincy, Manchester, Sargent Company has moved its Chicago offices to 1175 Old Colony building.

Lufkin Rule Company, Saginaw, Mich., reports a satisfactory increase in the demand for its well-known measuring.

Nanz Clock Company, New York, manufacturer of watchman's time detectors, announces the removal of its office, salesroom and repair shop to 178 Fulton street.

A. L. Whipple, formerly with the Curtain Supply Company, has re-entered the railway supply field as manager of sales for the Forsyth Brothers Company, Chicago. Mr. Whipple will engage in the eastern field and will at once open an office in New York.

John A. Stewart Electric Company, Cincinnati, O., has contracted with the Joplin & Pittsburg Railway of Kansas City and Pittsburg, Kan., for two 600-kilowatt direct connected railway units and complete power house equipment, consisting of water tube boilers, etc.

James G. Wilson Manufacturing Company, New York, manufacturer of rolling steel shutters, rolling wood partitions and rolling wood doors for roundhouses, has established an office at 305 Real Estate Trust building, Philadelphia, Pa., which will be in charge of A. H. Dodge.

Charles H. Spotts, for the past 10 years manager of the paint department of the Joseph Dixon Crucible Company, Jersey City, N. J., has resigned. Mr. Spotts is contemplating establishing a paint manufacturing plant in the vicinity of New York and is making his headquarters for the present at the Engineers' Club, New York.

H. W. Johns-Manville Company, New York, on account of increasing business in Detroit, Mich., and the adjacent territory, will soon open a branch office in that city at 72 Jefferson avenue. Willard K. Bush, who has been connected with the Milwaukee office of the company for a number of years, will be manager of the new branch. A complete stock of Johns-Manville products will be carried, so that shipments can be ordinarily made direct.

J. G. White & Co., incorporated, New York, has been awarded the contract for engineering and constructing a complete hydro-electric plant, with transmission lines, substations, etc., for the Central Georgia Power Company. This plant will be built on the Ocmulgee river, about 36 miles above Macon, Ga., supplying power to that point and to other points in the vicinity. The normal capacity of the plant will probably be 12,500 kilowatts, generated by water wheels under a 100-foot head. The crest of the dam will probably be 750 feet.

Horace H. Lane has announced the opening of an engineering office at 822 Penobscot building, Detroit, Mich. Mr. Lane will conduct a general engineering and construction business, including steam equipment, electrical installation,

structural work and complete plants. He has lived in Detroit almost continuously for the past six years, during which time he was connected with Westinghouse, Church, Kerr & Co., New York. Mr. Lane was in charge of the construction of the American Car & Foundry Company's plant at Detroit and has devoted his entire life to engineering work.

Technical Publicity Association, New York, at its annual meeting, April 30, elected the following officers to serve during the ensuing year: President, C. S. Redfield, advertising manager Yale & Towne Manufacturing Company; first vice-president, Rodman Gilder, publicity manager Crocker-Wheeler Company; second vice-president, C. N. Manfred, manager advertising department H. W. Johns-Manville Company; secretary, H. H. Kress, publicity department A. S. Cameron Steam Pump Works; treasurer, H. M. Davis, advertising manager Sprague Electric Company; members of executive committee, F. H. Gale, in charge of advertising General Electric Company, and C. W. Beaver, special representative Yale & Towne Manufacturing Company. Twenty new members have joined the association since the last annual meeting.

Goldschmidt Thermit Company, New York, announces the establishment of an office and works at 103 Richmond street, West, Toronto, Ont. The new branch was opened for business May 1, and is under the management of E. C. Rutherford. Mr. Rutherford has a wide acquaintance in Canada, having been for several years the manager of the Magann Air Brake Company and of the Canadian Brake & Supply Company. A complete stock of thermit and appliances will at all times be carried at Toronto, and the branch organization will be in a position to execute promptly the welding of heavy steel sections, such as stern posts of ships, crankshafts, etc., as well as trolley rails in paved streets, moter cases and other broken steel sections. A fully equipped repair shop will be in operation for the repair of steel castings up to 1,000 pounds in weight.

General Electric Company, Schenectady, N. Y., has issued its report for the year ended January 31, 1908. The net profits of the company were $6,586,653.37. Dividends paid during the year aggregated $5,183,614, leaving $1,403,039.37 carried to the surplus account. The total surplus January 31, 1908, was $16,513,836.14. The total sales billed during the year were $70,977,168, and the total orders received, $59,301,040. The company's consolidated balance sheet, as of January 31, 1908, showed total assets of $98,525,765. Of this sum $12,250,720 represented cash, $18,000,089 stocks and bonds, $541,900 real estate, $29,857,726 notes and accounts receivable, $1,276,294 work in progress, $70,673,067 merchandise inventories, $12,900,000 factory plants, including all lands, buildings and machinery, and $2,701,976 invested in copper mining. The total liabilities included $55,000 in 5 per cent debentures of 1892, $2,047,000 in 3½ per cent debentures of 1902, $12,872,750 in 5 per cent debentures of 1907, $108,791 in accrued interest on debentures, $1,759,517 in accounts payable, $1,469 in unclaimed dividends, $65,167,400 in capital stock outstanding, and $16,513,836 in surplus. C. A. Coffin, president of the General Electric Company, in his report, says: "Late in the year there was a sudden and severe shrinkage in the value of all merchandise and materials used by your company, notably copper. All said materials, whether raw, manufactured or in process of manufactnre, which were on hand January 31, 1908, were inventoried at the lower prices then prevailing. The book value of such inventories was thereby reduced by about $2,000,000. During the year all the assets and liabilities of the Stanley G. I. Electric Manufacturing Company, Pittsfield, Mass., were taken over by your company, and the factories owned by that company at Pittsfield are now a part of the factory plants of your company. In this practical liquidation of the Stanley company there has been a considerable shrinkage in the valuation of its factory properties, inventories and other assets, thus adding to the otherwise large depletion in the profits for the year. In view of the then great expansion in business your directors deemed it wise, early in 1907, to provide for future development at some point nearer the central west, in preference to a further enlargement of the plants at Schenectady and Lynn. For this purpose the unencumbered fee of about 700 acres of land adjacent to the city of Erie, Pa., was purchased at a cost, including engineering and other expenses, of $232,301.53. In view of the existing depression the erection of buildings thereon is deferred for the present."

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

Bruce-Meriam-Abbott Company, Cleveland, O.—Vertical gas engines are illustrated and described in a recently issued catalogue.

American Asphaltum & Rubber Company, Chicago, Ill.—A leaflet illustrates the use of "Pioneer" reservoir waterproofing asphalt in reservoirs at Iola and Independence, Kan., and Chickasha and Okmulgee, Okla.

H. W. Johns-Manville Company, 100 William Street, New York, N. Y.—An illustrated booklet sets forth the advantages of "Magic" boiler compound.

American Engineering Company, Indianapolis, Ind.—An interesting subject is handled in an interesting manner in a recently issued booklet entitled "Forty-nine Reasons Why New Railways Fail."

Allis-Chalmers Company, Milwaukee, Wis.—Recent publications include a leaflet devoted to portable air compressors, a bulletin on rotary kilns for cement plants and one on "Modern Rock Crushers."

United Electric Car Company, Ltd., Preston, Eng.—A 90-page catalogue recently issued shows the wide variety of rolling stock types built at this company's works for both electric and steam service. The catalogue is illustrated by a large number of halftone views.

Rock Island Lines.—The passenger department at Chicago has issued six unique mailing cards under the title of "Rock Island Bear Series," which are calculated to impress ticket agents of connecting lines with the desirability of ticketing people in need of vacations to Colorado via the Rock Island.

National Bridge Company, Indianapolis, Ind.—A recently issued catalogue of 148 pages and cover is devoted to concrete bridges. There are 63 full-page views of bridges designed by this company, many of them for steam and electric railways. Twenty-two full-page views show the same bridges under construction. The book also includes a large amount of valuable engineering information.

Association of American Portland Cement Manufacturers, Land Title Building, Philadelphia.—The Concrete Review for May has an increased number of pages and shows marked improvements from a typographical standpoint. In view of the additional expense involved in issuing the publication a minimum charge of 50 cents a year or 5 cents a copy will hereafter be made. The publishers state it is their intention to still further increase the monthly contents so that the journal may be thoroughly worthy of the important industry it represents.

General Electric Company, Schenectady, N. Y.—The CQ motor is described in detail in Bulletin No. 4584, recently issued. This motor is for direct-current circuits and is made up to 20 horsepower in size, and for voltages of 115, 230 and 550. Descriptions are given of belt tightener attachments, back-geared devices, motor generator sets consisting of two CQ motors rigidly connected, etc. The application of the motor to ventilating outfits, machine tools, etc., is also outlined. The extensive tables of dimensions, capacities, etc., in the bulletin will be found useful in preparing specifications.—Bulletin No. 4578 describes in a comprehensive manner the essentials of the various standard motor controllers manufactured for railway service. Among the controllers described are type B, which include the necessary contacts and connections for electric braking; type K, for series parallel operation of the motors; type L, also in the series parallel class, but which completely open the power circuit when changing from series to parallel; type R, which are designed to control the motor speeds by means of resistance only; and a brief outline of the Sprague-General Electric type M control system. Tabulated data and dimension diagrams of the many standard forms of controllers, together with illustrations of the apparatus, provide ready means of reference.—Bulletin No. 4579 describes the construction, installation and operation of the luminous arc headlight, for which is claimed many advantages over the carbon arc headlight for use on interurban roads or heavy railway service. The upper electrode of the luminous arc is a copper forging and the lower electrode an iron tube filled with a special composition. As the copper forging wears away very slowly, its life being from two to three thousand hours, the arc is kept constantly in focus and the light obtained being in excess of that given by the carbon arc, a very brilliant illumination is obtained. The parts of the mechanism are substantially made and few in number, and the appearance of the headlight is similar to the ordinary carbon arc headlight. If the polarity of the electrode is reversed the light given is very much less and this is utilized for dimming the headlight when passing through the streets of cities and towns.—Bulletin No. 4576 describes the type F form K-3 line of oil switches for panel installation and remote control. It contains extensive data for selecting the proper switch, current transformer, etc., for any desired service.

During the month of April the Chicago City Railway installed 391,595 duct feet of underground conduit and laid 8.7 miles of track, of which 5.21 miles were paved.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Wanted—Position as armature winder and mechanic. Ten years' experience. Can furnish good reference. Address "No. 586," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Detective, three years' experience. Both ends. Do you expect a strike? If you do I can make you a good proposition. Address "No. 587," care of Electric Railway Review, Chicago.

Want work on right of way, franchises, stock sales, etc. Promotor's right-hand man. Always in harness. Reliable and experienced. Address "No. 585," care of Electric Railway Review, Chicago.

Wanted—Position as superintendent of rolling stock or master mechanic on city or interurban railway. Have satisfactorily handled similar work on large metropolitan properties since horse car days. At liberty now; references exceptional. Address "No. 580," care of Electric Railway Review, Chicago.

Transportation man of seventeen years' experience, young, reliable and thoroughly familiar with organization, dispatching and timetable work, desires a position as superintendent or one of equal responsibility. Highest references regarding character, ability and past service. Address replies to "No. 577," care Electric Railway Review, Chicago.

POSITIONS OPEN.

General manager wanted for combined electric railway, electric light and gas property, operating 25-mile city and interurban railway located in middle west. Promotion assured for capable man. Must be able to handle relations with public, as well as operate property economically. Address "No. 589," care of Electric Railway Review, Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Wanted—To exchange, first mortgage gold bearing 5½ per cent bonds for material for electric railway, issue limited as to amount per mile; right of way held by company in fee simple. Those interested address Chicago Ottumwa & Western Railway, Hamilton, Ia.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

Wanted—Copies of Street Railway Review, January to June, 1906, inclusive, and one copy each January and February, 1906. Also Electric Railway Review for January 5, 1907. State condition and price. Address "No. 582," care of Electric Railway Review, Chicago.

NOTICE OF SALE

Detroit, Flint and Saginaw Ry.

June 18, 1908, 12:00 Noon, Front Door of Court House, City of Flint.

The Company was organized to build an electric railway between the cities of Saginaw and Flint, State of Michigan, of which 12 miles have been completed from Saginaw, south through the village of Bridgeport to the village of Frankenmuth, which is now being operated by a receiver.

Power House and Car Barns, fully equipped, are located at Bridgeport.

Franchises for complete right of way from Saginaw to Flint will be sold with the physical properties of the road as an entirety.

Unusually Attractive Opportunity for Capital

as the road when completed would consist of only about 35 miles and serve a population of about 112,000 people, with splendid freight possibilities. For full particulars, write

DETROIT TRUST COMPANY, Receiver

Penobscot Building, DETROIT, MICH.

THE REVIEW AND THE JOURNAL TO BE MERGED.

We have pleasure in announcing that with the first issue in June the Electric Railway Review and the Street Railway Journal will be consolidated. It has been the belief of the publishers of both these journals that the exacting requirements of the electric railway field could be much better met by one publication embodying all the editorial strength and all the business resources of both organizations.

The tendency toward specialization in the several departments of electric railways has called for an increasingly high order of ability in the personnel of the corporations engaged in that great industry. This necessarily has made larger demands upon the resources of the publications which are seriously engaged in the dissemination of news and in the treatment of the problems in a rapidly growing field. The endeavor on the part of each paper to give the latest and best information has resulted in a considerable duplication of matter, and from this has followed an unnecessary expense in preparing and printing twice matter that might be just as well circulated if printed but once.

Moreover, advertisers have indicated in many important instances a feeling that there was not room for two strong weekly papers. The tendency toward a division of the patronage of many large advertisers necessitated a reduction in the amount of space which both they and the publishers felt was desirable, not to say necessary, to insure profitable results.

The consolidated paper will make a technical journal of such wide reach and scope, such editorial and financial potency, as will easily meet the demands of the most critical and exacting. The "Electric Railway Journal," which will be the name of the consolidation of the Electric Railway Review and the Street Railway Journal, will draw to it not only the good-will, the equipment and the traditions, but for the main part the personnel, of both the existing papers. We bespeak for the "Electric Railway Journal" the good-will, the patronage and the support of all of our friends who have so warmly assisted us in making of the Electric Railway Review the strong and reputable publication which it is.

The "Electric Railway Journal" will carry out all engagements which the Review has contracted with both advertisers and subscribers. The subscribers to the Review will receive the "Electric Railway Journal" to the end of the terms for which they have paid their Review subscriptions. Those who are now subscribers to both papers will be credited on the "Journal" mailing list with the unfulfilled terms of their Review subscriptions.

Three-Cent Fares and Three-Cent Service.

Reports from Cleveland during the past week indicate that a semi-municipal holding company is not a panacea for all the inconveniences incidental to street railway transportation in a large city and that even 3-cent fares may have their disadvantages. We have previously expressed in these columns a curiosity as to how Mr. Johnson proposed to operate a system at a rate of fare less than the ordinary figure for operating expenses. The past few days have brought some enlightenment and the people of Cleveland are learning things about 3-cent fares that were not included in the campaign speeches. The Municipal Traction Company is charging only three cents within the city limits of Cleveland but two cents additional is charged for a ride beyond the city limits and one cent additional for each transfer. Thus many of the suburban residents are obliged to pay six and even seven cents for a ride to the business district. In addition cars are being rerouted to reduce mileage and short unprofitable routes are being abandoned. The protests against the service of the Municipal Traction Company, voiced at the meeting of the city council last Monday evening, differed from similar expressions against private corporations that we have heard only in the fact that this time the mayor was on the other side of the fence. A 3-cent fare would be an excellent thing if it did not mean 3-cent service.

Painting Poles Near Switches.

The conditions surrounding turnouts and sidings vary widely on interurban roads and frequently the obstructions along the right of way are such that a motorman must be thoroughly familiar with the track if he is to approach a switch with any degree of certainty as to just where that switch is located. Sometimes a siding may be just around a curve so that it is very desirable to have a car under full control before the target on the switchstand can be seen. Again, on straight track the line of poles may hide the target so that if the ground is covered with snow it is also especially advisable that some fixed sign be placed where it can always be seen by the motorman and tell him how far he is from the switch. On the Illinois Traction System, to serve the purpose of indicating the location of a switch, a scheme of painting the poles has been found to satisfactorily meet these requirements. Starting at a fixed distance away from the switch, say 1,000 feet, the base of the pole to a height of about 12 feet is painted white. From this pole with its coating of paint 12 feet high each following pole toward the switch is similarly painted, except that the height of the band of paint is regularly decreased by steps. With a line of poles so painted, no matter whether they be on straight track or on a curve, the motorman soon learns to tell without thinking how much distance he has yet available in which to stop his car before it will reach a switch. This scheme of painting poles to a varying height has so many advantages over a sign board which exhibits only the distance between the board and the siding that there is considerable to be said in its favor

Several recent derailments, some with and others without loss of life, emphasize strongly the value of guard rails. Our steam railway friends, who are, we must admit, more experienced in track construction than we, consider the guard rail a vital part of their track structures and have studied its functions thoroughly. True it is that guard rail construction takes various forms, but the differing types of rails and stringers all are laid with the same end in view. Probably far more than a dozen serious accidents have been averted on interurban lines during the last year from no other reason than that even though the car wheels had left the rails there was a guard rail which constrained these wheels to a path on the ties until some bridge or trestle had safely been passed. In view of the unified agreement that a track structure is not properly built unless the sharp curves and rails on trestles have guard rails or guard stringers, and also because there are many widely different arrangements of rail, stringer and bolted plate, all of which are intended to serve the same purpose, we would suggest that the subject of guard rails is a fit one for consideration by the committee on "Way Matters" of the Engineering association.

Standardize the Guard Rail.

SECOND-HAND MACHINERY IN RAILWAY PLANTS.

The economies resulting from the use of second-hand machinery in moderate capacity power plants are many. The increasing size of generating and auxiliary equipment in city stations, the need of concentrating as much generating capacity as possible in a given floor space, and the improvements in economy of operation which designers of large units are striving to attain are all tendencies in favor of the transfer of partly worn-out machines to plants where the requirements are less severe.

In the power service of a great urban system it is on the whole true that the traffic is sufficient to support refinements in machinery design which cannot be afforded by the small road. There is consequently an opportunity now and then in connection with the rehabilitation of a large or even moderate sized city plant for the smaller plant of the outlying districts to secure additional machinery suitable for its needs at a reduction in cost considerably below the expense of new equipment.

Large generating stations are almost always designed in detail long before the dates for machinery delivery as promised by the manufacturers, and as a rule provision for future expansion is made with apparatus of the latest type in mind, rather than with second-hand units. Even if the latter type of equipments could be utilized satisfactorily, there would be no certainty that it would be available when it became necessary to enlarge the plant. The need of the most efficient machinery and the most reliable service which money can effect in the plant supplying the larger systems does not favor the use of anything but first-hand apparatus in the majority of large plants. Then, too, the capacities of generators and engines ordinarily available in the second-hand markets do not exceed 750 to 1,000 kilowatts, and it is becoming a rare practice for a large station to install units of such small power in extensions. The small road, however, in most cases finds a machine of even 500-kilowatt rating a most important addition to its resources.

If expansion becomes necessary it is a mistake to overlook the possibilities of the second-hand market if the company is one of rather limited resources. It sometimes happens that even a large plant can be carried past a bad breakdown period by the temporary installation of a second-hand unit.

The most important point in the purchase of any second-hand unit or auxiliary machinery is its physical condition and capacity for the work in the new location. Too much cannot be known of the operating history of any such apparatus, and after an option is taken upon it, inspection by an engineer of experienced judgment should invariably precede purchase. It is absurd to expect that even a second-hand machine for power plant service can be bought for little or nothing. A machine in good condition may be sold in the second-hand market for perhaps 50 to 80 per cent of its original price, but when the price goes much below these figures it is safe to make a very exhaustive study of the machine's capabilities before accepting it. It may be possible in some cases to make tests of service capacity, regulation, insulation, valve action, parallel operation and convenience of adjustment before taking the unit away from its first place of service. If records of the repairs expended on the machine can be had so much the better. Some consideration also should be given to the ease and safety with which the machine can be taken from its original service and transferred to the new site. The important point of the whole problem is that it is much better for a small road to have the benefits of service from second-hand machines of relatively large capacity, provided they are reliable, than to be short of power through the inability to buy machinery of the latest and most efficient design.

It is not too much to expect a renewed lease of life when a machine of standard design is transferred from the exacting conditions of city service to the less severe requirements of the smaller road, provided it is in fair condition when sold. The fluctuations of the load are relatively more severe in the case of the smaller road, but as a rule the total load is for a time well within the capacity of the plant as a whole when a machine of several hundred kilowatts rating is added to the equipment. An old machine originally designed for railway service will generally stand such fluctuations within its limits of capacity better than it will hold its service under excessive overloads.

To a large extent, of course, each problem in connection with the selection and purchase of a second-hand unit is one of special characteristics. On account of the greater cost of generating units as compared with auxiliary equipment and the enhanced ease of inspection of the latter apparatus, it is not worth while usually to spend much time upon the second-hand market for auxiliaries. Low cost generating capacity interests the average manager of a small road more than reduced prices on minor equipment.

Communications

CLASSIFICATION—HEARING AND ACTION BY OHIO RAILROAD COMMISSION.

To the Editors:

This commission listened to arguments concerning the classification of accounts tentatively proposed by the interstate commerce commission presented by a committee representing about 30 interurban lines in Ohio and Indiana, and also considered the brief filed by these lines with the interstate commerce commission criticizing and suggesting changes in such classification. [See Electric Railway Review of May 2, 1908, page 529.—Eds.]After having heard the committee and considered the brief, the commission addressed a communication to Prof. H. C. Adams of the interstate commerce commission calling attention to the objections of the traction lines and bespeaking for them the consideration of the interstate commerce commission in the matter of the changes suggested in such classification. The commission is in receipt of a letter, in response to the one herein referred to, from Professor Adams, in which he states that his office has modified the tentative classifications to Circular No. 20 very much along the lines indicated by the traction people in their brief.

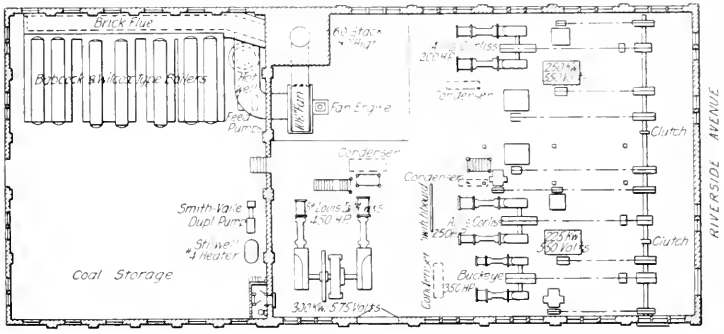
H. D. MANINGTON,
Secretary Railroad Commission of Ohio.

Columbus, O., May 9, 1908.

REMODELING AN ELECTRIC RAILWAY POWER STATION.

The power plant of the Jacksonville Electric Company in Florida has recently been completely remodeled. The new work, which has been carried on by the Stone & Webster Engineering Corporation, included the installation of new machinery and a rearrangement of the existing equipment. An account of this interesting work may be of value to those railway engineers whose power stations will soon need to be remodeled or increased in capacity.

The Jacksonville station is located about a quarter of a mile from the business center of Jacksonville on the shore of the St. Johns river. The arrangements of the machinery before and after the present improvements were made are shown in the accompanying engravings.



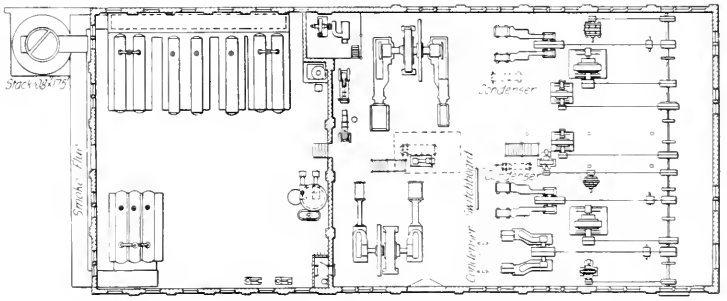
Jacksonville Power Station—Plan Before Remodeling.

The remodeled plant contains all the machinery that was in the old station with the exception of the old stack and an induced draft system located near the original batteries of boilers on the engine room side of the partition wall dividing the station into two parts. This old stack was built in part of brick and in part of steel, being 100 feet high above the grates and 60 inches in inside diameter. With the aid of a 108-inch fan, driven by an 8 by 6 inch engine, direct connected, it served 1,250 horsepower capacity of water tube boilers. With the additional 520-horsepower boiler to be placed in the plant, there became necessary a new stack 108 inches in diameter and 175 feet high above foundations, and to make room for a new electric generating unit the old stack and fan system were dismantled. The new stack was erected on the outside of the building beyond the boiler room. A flue was run around the outside of the building to the stack, as shown in the illustration, thus making it possible for the stack to serve both batteries. Part of the space formerly occupied by the fan set and old stack is now devoted to the condensing equipment of the new 800-kilowatt unit.

The natural draft of the new stack is sufficient to take care of all the boilers in the plant. Part of the stack is cut off with a baffle in the flue arranged so that in the event of the extension of the station still farther in the direction of the boiler room the other side of the stack can be used for the reception of a flue from future boilers. The stack foundations are of concrete on piling, the former being 14 feet deep and 24 feet square. The present boiler plant includes three 150, two 400 and one 520 horsepower water tube Babcock & Wilcox boilers set in two rows with a central firing aisle 24 feet wide between the old and the new equipment. Space is available for the installation of two more boilers of like capacity as they may be needed. The present load upon the plant is very largely for railway purposes, although the company also supplies current for power and lighting. The new boiler contains 5,200 square feet of heating surface and 88.1 square feet of grate area, with ½-inch air spaces. There are two hundred and fifty-two 4-inch tubes in the new boiler. The old boilers are operated at 125 pounds steam pressure, but the new unit is designed for 200 pounds pressure.

The coal supply of the plant is obtained from barges which are brought alongside a wharf located about 600 feet east of the plant. The barges are unloaded by derrick, the coal being discharged into push carts on an elevated platform, whence it is wheeled along the platform structure to a storage yard. It is planned to build an industrial track from the coal storage space across the yard and through the boiler room. Means for weighing the coal will be provided near the entrance to the boiler room.

A Wefngo water softening equipment has been erected outside the boiler room with a connection to the well which supplies the plant and to a new automatic Wilcox water measuring device installed in the boiler room. The supply of condensing water for the station is drawn from the river through a 16-inch suction pipe carried on hangers beneath a wharf. Near the end of the wharf a suction inlet screen box is installed of capacity enough for two 16-inch pipes with separate compartments for individual cleaning. The main discharge pipe for the plant is 30 inches in diameter and it is turned into the river on the other side of the wharf and about 150 feet from the suction inlet.



Jacksonville Power Station—Plan After Remodeling.

The new generating unit is an 800-kilowatt General Electric 600-volt, flat-compounded, direct-current machine, direct connected to a 24 and 48 by 48 Rice & Sargent horizontal cross-compounded condensing engine whose normal speed is 100 revolutions per minute. This engine has a maximum rating of 2,300 horsepower and its steam guarantees are, at 26-inch vacuum, 100 revolutions per minute and 150 pounds pressure at the throttle:

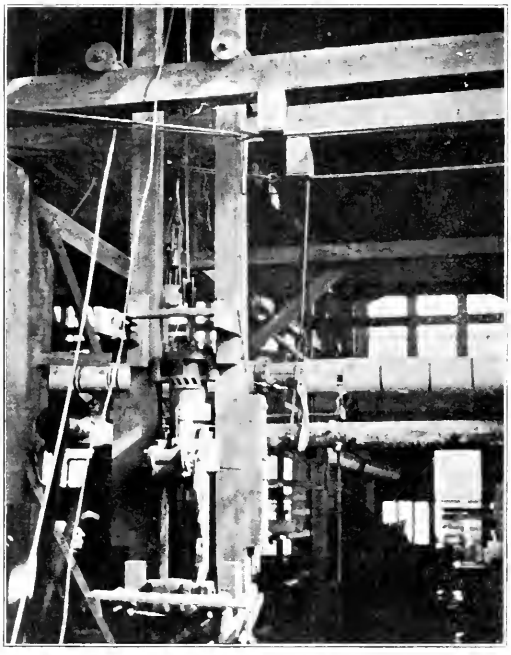
Per cent of load	50	75	100	125	150
Pounds	14.2	13.9	13.9	13.5	14.3

The engine has a 25-ton flywheel and a reheating receiver of 400 square feet surface. It is provided with a 6-inch connection off the auxiliary steam main of the station, which can

be used to operate the low-pressure side through a reducing valve in case the high-pressure side of the unit is disabled.

The new condensing apparatus consists of an Alberger barometric set with an 8 and 16 by 12 horizontal rotative dry vacuum pump and a volute centrifugal pump driven by an 8½ by 10 inch Harrisburg engine. The condenser is large enough for two 800-kilowatt units, and will condense 40,000 pounds of steam per hour with a 26-inch vacuum and a circulating water temperature of 85 degrees F.

The old equipment of the station, which is retained for railway service, includes a 300-kilowatt generator, direct connected to a 16 and 32 by 42 inch engine and two 250-kilowatt belted sets. It is planned to use the latter only at times of peak load or in other emergencies when economy of operation is not the first requisite. The balance of the machinery is used for power or lighting service. The 300-kilowatt set is piped to the barometric condenser so that either that or a



Jacksonville Power Station—Roller Supported Pile Driver Inside Station.

surface condenser originally supplied can be utilized. Ordinarily the new condensing set will be used. All the other old engines are provided with individual surface condensers, but the piping is so arranged that they can also exhaust into the barometric condenser.

In connection with the generator installation the railway switchboard was remodeled and six new single-circuit 1,200-ampere feeder panels added. The board now contains 16 panels, of which three are devoted to alternating-current service and the balance to direct-current uses.

The accompanying halftone engraving illustrates a portable pile driver carrier which was used in the plant's construction in connection with the foundation work for the new generating unit. The driver was installed on a frame carried on two longitudinal timbers and free to move back and forth on roller wheels as shown. The cross timbers were strengthened by iron truss rods on their under sides. The arrangement enabled the work of the driver to be done with the minimum interference with piping and other station fixtures, and the space occupied was so small that very little delay was occasioned by the existence of the apparatus.

STANDARDIZATION COMMITTEE MEETING.

The standardization committee of the American Street and Interurban Railway Engineering Association met at Pittsburg on May 7 and 8 pursuant to a call issued by the chairman, W. H. Evans, International Railway Company, Buffalo. There were present at the meeting the following members of the committee:

W. H. Evans, chairman master mechanic, International Railway, Buffalo, N. Y.

M. O'Brien, master mechanic United Railways Company of St. Louis, St. Louis, Mo.

J. M. Larned, engineer maintenance of way Pittsburg Railways Company, Pittsburg, Pa.

H. W. Blake, editor Street Railway Journal, New York City.

L. E. Gould, editor Electric Railway Review, Chicago, Ill.

C. B. Fairchild, editor Electric Traction Weekly, Cleveland, O.

A complete report of the work accomplished at this meeting is not yet available for publication.

The subjects considered were: "Standard Height of Couplers for City and Interurban Cars"; "Standard Automatic Couplers for Interurban Cars and Radial Draft Rigging"; "Standard Height of Platforms, Car Steps and Bumpers."

The committee's work at Pittsburg mainly comprised the formulating of a scheme for obtaining complete data with which the committee may be able to consider these problems from the standpoint of the requirements of the entire country.

PRAISE FOR THE BOSTON ELEVATED RAILWAY.

A. E. Pinanski of Harvard law school has been awarded the Baldwin prize of $100, offered by the National Municipal League for the best essay on municipal relations. The subject of Mr. Pinanski's thesis was "The Street Railway System of Metropolitan Boston." The writer says in part:

In spite of remarks to the contrary (for there will always be those persons who are too ready to attack public service corporations), it must be admitted that the Boston Elevated Railway today puts its great resources and facilities at the service of the public in the most efficient way and in absolute good faith. The position which it now holds in the community may be attributed in a large degree to the high standard of its officials, who have endeavored to meet all questions in a public-spirited way.

The company has continued its liberal policy toward its employes in respect to their wages, as well as in other matters. It is only because of this fact that we are able to say that the employes of the Boston company compare favorably with those of any other large city in the world, in matters of politeness and efficiency, and some enthusiasts say that the standard of the employes is unsurpassed in any other city.

In continuing the policy of introducing semi-convertible cars to parts of the urban and suburban system which will properly admit of their use, the Boston Elevated Railway is continuing the traditions of the Hub's leadership in street railroading. These cars, involving the latest improvements in construction, are characterized by an easy access arrangement, the opening and closing of the doors by compressed air power under control of the motorman, folding cabs in which the motorman operates the car free from the jostling and comments of the passengers and the most improved and modern system of ventilation. Thus it seems that the city of Boston at the present time has very little cause for complaint.

The last report of the Boston Elevated Railway shows that 11 per cent of its net earnings is returned to the city in taxes and other assessments. This is a better dividend to the municipality than is given by any of the municipally operated roads in Europe, including Glasgow. The road gives good service, has no water in its stock, pays dividends to its stockholders and pays the city (which has none of the expense or trouble of management) for the privilege of doing business, $1,500,000 a year.

BRIEF ON ACCOUNTING SCHEME SUBMITTED TO PUBLIC SERVICE COMMISSION, SECOND DISTRICT, ON BEHALF OF NEW YORK STATE ASSOCIATION.*

It may be remarked as curious, although doubtless it is immaterial upon the subject under discussion, that the legislature should have seen fit to make provision for a uniform system of accounts for street railroads, the purpose of which must be largely the protection of its public investors, while the many municipalities and quasi-municipalities within the state of New York, all of whose operations are matters of public interest, have never been required to establish any uniform system of accounting with respect to the operations of any of their departments, regardless of whether they involve the operation of public utilities or not. Scientific and exact information with respect to the conduct of municipal government within this state, would seem to be more worthy, or at least as worthy of the efforts of the legislators as similar knowledeg about street and electric railroads.

Differences Between Electric and Steam Roads.

Neither the federal statute nor the state statute requires, by a fair construction, that the accounting of all common carriers should be uniform and identical, and the marked distinction in the methods of construction and operation of steam or general railroads and street or electric railroads renders the same system of classification of accounts for both kinds of railways incongruous and objectionable.

The certificate of incorporation of a railroad company in New York state must differentiate as to the kind of road to be built or operated. And after incorporation the powers and rights are distinguished in many ways, among them being: (a) With respect to the rights to operate on highways, steam railroads applying to the supreme court and street railroads aplying to property owners and local authorities. (b) Street railroads may make extensions, while no such provision or right exists in a steam railroad. (c) Rates of fare are different and governed by different sections. (d) Street railroads are required to issue transfers in certain cases, while no such obligation exists with respect to steam railroads. (e) Street railroads are obliged to pave between their tracks. (f) A street railroad is obliged to permit another street railroad to use its terminals in certain cases, an obligation which is not imposed upon steam railroads. (g) The time within which a street surface railroad may construct and operate its railroad is further limited by the railroad law.

In addition to the distinctions running through all statute law in respect to general or steam railroads and street or electric railroads, there are physical differences even more marked.

1. The rails themselves are different, and the street railroad may not use certain kinds of rails.

2. The roadbed of most street and electric railroads is located upon public highways, while the roadbed of most steam or general railroads is located upon private right of way.

3. The roadbed itself is of different type of construction.

4. The motive power is differently produced and differently applied. While in many cases the primal source of power is the same, to-wit, coal, it is not necessarily so, as many electric railroads are operated by electric power produced from the fall of water, but even where the primal agency is coal, the method of utilizing it as a motive force is entirely distinct in steam and electric railways, with the resultant economies largely in favor of the street or electric railway. In the case of street railways the coal is converted into electricity at a central power station, and is transmitted by means of conductors to the motors on the cars. In the case of steam railroads, the coal is burned on the unit, or train, converting water into steam on that unit, in operation. In the case of the electric railroad a large investment in electrical machinery, buildings and transmission conductors is necessary, which has no counterpart in steam railroad accounts.

5. The character of the service rendered is entirely different, steam or general railroads deriving their main income from freight, while street or electric railroads derive their main revenue from passenger service.

Upon this subject we submit the following comparative statement, showing gross earnings of steam and electric railways in the state of New York:

	Steam Railways		Electric Railways	
	Amount.	Per cent.	Amount.	Per cent
Passenger	$ 99,720,261.64	26.35	$77,848,717.92	98.76
Freight	250,313,697.83	66.13	498,207.06	.63
Express	10,756,622.10	2.84	271,473.69	.35
*Miscellaneous	17,689,888.22	4.68	200,875.42	.26
	$378,480,470.09	100.00	$78,819,304.09	100.00

*Miscellaneous earnings contain mail and baggage receipts, rent of equipment, etc.

A comparative statement of cars in service for steam and electric roads follows:

Steam railroads—		
Locomotives	9,125	2.79%
Passenger cars	8,089	2.47%
Freight cars	307,312	94.00%
Baggage and mail	2,438	0.74%
Total	326,964	100%
Electric railways—		
Locomotives	9	0.06%
Passenger cars	*14,442	93.55%
Freight, express and mail	987	6.39%
Total	15,438	100%

*This includes motor cars and trailers.

Note.—Snow plows, snow sweepers and work cars are not in this report.

6. Street railroads operate small train units, consisting of one or two cars, and at frequent intervals, while steam railroads operate large train units of from 4 to 12 passenger cars, and from 20 to 100 freight cars, at infrequent intervals.

7. The method of collecting and registering fares is entirely dissimilar. On street railroads fares are for the most part collected in cash by conductors on the cars, while on steam railroads fares are received, for the most part through the sale of tickets at depots, the tickets covering, frequently, not only the railroad at whose station the ticket is sold, but also various other lines, which means an entirely different system of accounting in this respect.

8. The units of comparison used by street railroads are the "car-mile," the "car-hour" and the "per car per hour," while on steam railroads the units of comparison are "passenger—per mile," "ton—one mile" and "train-mile."

9. There is an entire and obvious dissimilarity between the terminal facilities and charges of steam railroads and street railroads.

10. In practice street railroads construct their lines to the doors of their passengers, while steam railroads are operated usually between large centers. The street railroad goes to the home of the passenger, while the passenger is obliged to go from his home to the steam railroad.

Upward of 60 years of steam railroad practice have evolved a system of accounting for steam railroads which may fit its requirements, and for over 20 years the greater part of the steam railroads have been subject to the jurisdiction of the interstate commerce commission and that commission and its officials have become entirely familiar with all the methods and characteristics, both in respect to accounting and otherwise of the steam railroads. The street railroad companies have been operated by electricity as a motive power for the most part for less than 20 years, and a very large percentage of the street and electric railroads have not been operated for over 10 years. The street and electric railroads have not either for a long time or in a great measure been in touch with the interstate commission and an intimate knowledge of methods of operation and accounting which the interstate commission has acquired in 20 years of familiarity with steam railroads cannot possibly have been acquired in respect of street and electric railroads in the brief interval of not exceeding two years, that the attention of the interstate commission has been turned to street and electric railroad matters.

In a very large degree street railway problems are entirely local. In so far as the street railways are operated within the confines of a single city, the application to them of the necessarily large and comprehensive views of the interstate commission is likely to be misfitted. The large majority of street and electric railroads, both urban and interurban, under the jurisdiction of the public service commission of the second district, New York, are in no manner engaged in interstate commerce and are not subject to the control of the interstate commission.

At the meeting of the American Street and Interurban Railway Association and the American Street and Interurban

*Abstract of document prepared by the following committee of the Street Railway Association of the State of New York: Henry J. Pierce, president International Railway Company of Buffalo, chairman; C. Loomis Allen, vice-president and general manager Syracuse Rapid Transit Company; E. S. Fassett, general manager United Traction Company, Albany; A. L. Linn, Jr., general auditor Mohawk Valley lines; J. C. Collins, auditor Rochester Railway Company; H. M. Beardsley, treasurer Elmira Water Light & Railroad Company; Morris Cohn, Jr., counsel to the committee.

Railway Accountants' Association, held at Atlantic City in October, 1907, the matter of the classification was taken up, with the result that the former classification was enlarged so as to include 50 primary accounts, and the classification adopted by these associations in October, 1907, contains, as this committee believes, full and sufficient primary accounts for all the known purposes of the street and interurban railways within the jurisdiction of the public service commission, second district, New York. The influences which caused the enlarged number of primary accounts adopted at Atlantic City were the growth and requirements of interurban railways and the agitation of various supervising boards and bodies in reference to the character of the accounts of street and interurban railways. As 50 primary accounts, amplified to meet the particular requirements of individual roads, furnish all the detail and information which the managing and operating officers of a street railroad need, it seems to the committee to follow that they must contain all the information which supervising and regulating bodies or the public would care to know.

It is respectfully submitted that the results of the years of work of the street and electric railway accountants should not be lightly set aside and a substantially steam railroad classification substituted therefor, without the strongest and most important reasons. In fact, if steam and electric railway accounting must be identical, it is respectfully submitted that steam railroads are more likely to become electric railroads than are electric railroads to become steam railroads, and therefore, logically, the system of steam railroad accounting might better be amended to conform to the experience, theory and practice of electric railroads than otherwise. We venture to say that there are few if any cases of the substitution of steam as a motive power upon a railroad which had been operated electrically and the contrary tendency is everywhere apparent.

Primary Operating Expense Accounts Unduly Extended.

The primary operating expense accounts in the tentative classification are unduly extended beyond the point of practical benefit for any electric railroad, and its adoption would cause peculiar and unnecessary hardships upon the smaller roads affected if the keeping of 116 primary accounts shall be incumbent upon all lines having a gross annual revenue of $50,000 or over.

The following electric railroads operated in the state of New York in the year ended June 30, 1906:

Gross earnings and number of companies of				First district.	Second district.	New York state.
less than	$	10,000		6	8	14
Between	$ 10,000	and	25,000	1	16	17
	25,000		50,000	3	10	13
	50,000		75,000	2	11	13
	75,000		100,000	1	4	5
	100,000		200,000	4	10	14
	200,000		300,000	2	3	5
	300,000		400,000	..	2	*3
	400,000		500,000	1	..	1
	500,000		600,000	1	1	2
	600,000		700,000	..	1	1
	700,000		800,000	..	..	..
	800,000		900,000	1	2	3
	900,000		1,000,000	1	..	1
	1,000,000		1,500,000	..	1	1
	1,500,000		2,000,000	3	1	4
	2,000,000		3,000,000	..	1	1
	3,000,000		4,000,000	1	..	1
	4,000,000		5,000,000	..	1	1
	5,000,000		10,000,000	..	..	..
	10,000,000		20,000,000	3	..	3
Total				30	72	103

*One company located in both districts.

The distribution of payments for damages over eight separate primary accounts will result in confusion rather than clarity. The cause of a given claim for damages is not infrequently in itself uncertain or the result of two or more unrelated facts, so that the expense may be distributed as caprice may direct. The percentage of earnings of electric railways which are absorbed by claims for damages are very much higher than the percentage of earnings required for this purpose by steam railroads.

In the same manner the distribution of expenses of stationery and printing over seven accounts and the distribution of insurance over six accounts and the distribution of expense of power over various accounts, where it cannot be absolutely measured, but can only be arbitrarily divided, are fair examples of the criticism which we have made upon the unnecessary refinements involved in the tentative classification.

The so-called "adjustment accounts" introduce a new factor in street railway accounting. Heretofore only the net results of outside operations have been treated at all, and those have been treated as credits to income account from sources other than operation. With the majority of street railroad corporations these accounts will be of minor consequence, but in the absence of a classification of electric railway revenue, no benefit or statistical information of value can be obtained from the addition of the accounts referred to.

While the committee does not urge all the foregoing criticisms as formidable and insurmountable objections to the tentative classification, may it not in fairness ask why the classification containing these troublesome, expensive and necessarily inaccurate accounts should be imposed upon the street railroad companies, arbitrarily destroying comparisons to that extent with the past, and setting up accounts which years of street railway practice have not found necessary, and which street railway accountants and managers almost universally condemn? The committee thoroughly believes that a system of classification which would eliminate subgeneral accounts, limit the primary accounts to approximately 50, which should be compulsory upon all street railroads, and allow subprimary accounts to those street railways which desired to use them, would make for a harmonious and logical system of accounting which would not be burdensome upon the smaller roads, and the option of using subprimary accounts of which would be almost universally exercised by the larger roads.

Construction Expenditures.

The substance and character of the criticisms made in respect to the operating expense accounts are largely applicable to the tentative classification of expenditures for road and equipment.

The present classification of construction and equipment accounts has been in use for years and has proved entirely adequate for the needs of existing street railway companies. Heretofore these accounts have been kept under a single head known as construction and equipment accounts, and it would be exceedingly difficult, if not impossible, to divide the charges heretofore made to this single account so as to conform to the tentative classification of expenditures for road and equipment submitted in Circular No. 20. To keep the future expenditures for road and equipment in accordance with the proposed classification would not be either difficult or impossible, but would be of slight value in the case of existing companies where by far the larger part of the expenditures for road and equipment have been already made and cannot be so subdivided.

The general objection as to excess of detail made in respect to the primary operating expense accounts applies with equal force to the proposed classification of expenditures for road and equipment.

The note to account No. 61 under this head which forbids the charging of discounts on securities issued for construction purposes against construction is against all precedent, and no necessity for such rule is suggested or we believe can be shown. It is apparent that securities issued for construction cannot at all times and under all circumstances be sold at par or without a discount, and where the discount is paid, whether it is paid direct to a purchaser or whether it is paid as commission to a broker makes no difference in fact, and ought to make no difference in the theory of such an account.

Joint Facilities Accounts.

The joint facilities accounts involve expense and detail out of proportion to the statistical value of the results, and although the principle involved may be correct in theory, its use would produce inaccuracies in practice because of actual conditions.

The avowed purpose of the joint facilities accounts is, we take it, to correctly state and distribute the actual revenues and actual expenditures between companies using the same tracks or facilities, in whatever form or manner such use may occur, and the payment for it be made. This question arises in electric railway practice, for the most part, in the case of interurban companies whose cars are operated on other lines within the limits of large cities. Passengers are transported over the city lines under contract agreements of innumerable differences of character and detail. The practicability or necessity of applying to electric railway carriers the principles involved in the complicated structure of joint facilities accounts is, in view of the circumstances and number of the transactions involved, doubtful. Its main practical importance would be upon the percentages of total operations when combining the reports of all the electric railroads in the country or a given district, and the circumstances and number of these transactions are not sufficiently great to make an appreciable impression upon the total percentages.

Let us assume the case of an interurban road whose cars are operated over a city line, for which service the city company receives a proportion of the fare collected within the city, say 2½ or 3 cents for a 5-cent fare per passenger. It is purposed by the tentative classification to divide the money so received between: 1. Use of capital. 2. Maintenance expenses. 3. Transportation expenses. 4. Administration expenses, if any.

The first difficulty which is met in making such a subdivision is found in the fact that the cars are usually operated over a given piece of track by the interurban company, and that passengers are frequently transferred without additional charge to other lines of the city company, with which the interurban company has nothing to do. How is it possible, except by arbitrary statement, to fix the amount of capital used? And how can even any such arbitrary statement represent any degree of accuracy? How is it possible, by other than an arbitrary division, to fix the amount of the fare properly chargeable to maintenance, and what part of the track, if less than the whole, is included within the maintenance to be charged? How is the power expense of the city company to be divided and how is the amount of power used by the interurban company to be ascertained? And the same questions arise, no matter what the form of the operating agreement. This subject opens up such a tremendous field of speculative accounting as to be little less than appalling. Moreover, all of the contracts under which such joint facilities are now provided have already been made and run for many years. If the total payments under existing contracts are not all absorbed by the four subdivisions laid down, to what account should the surplus be credited, and if a total computation of the four items stated shows that they exceed the amount received in the way of income, from what source shall the deficiency be made up? Any information obtained under the plan proposed would be more than likely to be untrustworthy and valueless because made on arbitrary division. The amounts involved in the joint facilities in the second district of New York are exceedingly small but in some instances there are two or more urban companies upon whose tracks one or more interurban companies are operating. An attempt to follow out the joint facilities accounts in respect to expenditures would only result in a condition of confusion which would be hopeless and inextricable. The committee, with some diffidence, ventures to urge that, so far as electric railroads are concerned, the whole question of joint facilities can be disposed of in the revenue accounts, if the lessee company shall deduct from its gross revenue payments made by it on account of joint facilities, and the lessor company shall include such items in its gross revenue. No confusion can accrue under such a plan in assembling statistics into totals.

We also venture to respectfully differ from the statement made in respect to the tentative classification that so far as relates to street railways there is a definite and long-felt deficiency in the subject which these particular accounts meet.

Depreciation.

The mandatory and arbitrary charges for depreciation contained in the tentative classification should not be required.

The discussion of the subject of depreciation opens an apparently inexhanstible field, and the committee believes that by subdividing the subject a clearer view of the matter can be obtained. In what is said the committee has not been unmindful of the expressions made by your honorable commission in its report for the six months ended December 31, 1907, in which you say in substance that the question of keeping a depreciation account is one that you cannot consider to be open to debate.

History of the Past and Theory of Depreciation.

The wonderful development of railroads in the United States is primarily accounted for by the energy of its people, stimulated by its climate and the fertility and resources of its soil. The construction and operation of railroads have been fostered and encouraged by legislative enactment, and the incentive of substantial profits has in the past induced courageous and far-seeing men to devote their abilities and lives to railway construction and operation, and it may be assumed that only these favorable conditions and incentives would have so influenced them.

The history of American railroads has been with a few minor setbacks a story of progressively increasing earnings, largely due to the upbuilding of the country by the existence of the railroads themselves, and while this condition of progression has continued it has not been thought essential or proper to keep from the owners of the property that return upon their investment which the net earnings and actual increase in the value of the property, as shown by the increase of gross earnings, would apparently warrant. During this period of progressively increasing gross earnings, direct charges for depreciation have been for the most part omitted in all railway accounting, and doubtless, as was stated in the report of this commission for the six months ended December 31, 1907, "such depreciation has been handled not infrequently by increasing the capitalization."

Steam railroad companies have thus been permitted to keep up their properties, without objection, and, as we believe, without harm, to the public, for a period covering in many cases half a century, and the electric railroads which are even yet not far beyond the threshold of their development have naturally and, as we maintain, rightfully followed the same practice.

In theory, of course, charges of depreciation in respect of roadbed, buildings, structures and equipment, and credits of appreciation for right of way, terminals and franchises, would doubtless have been more scientific, but probably not more exact. The question of depreciation is fundamentally, to use part of the language of Professor Adams, a question of values, and following that premise it may be fairly said that the question of depreciation or appreciation of a property is not a question of accounting at all, but is a question of policy and judgment, to be wholly determined by the directors.

Charges of depreciation, when made, are of necessity arbitrary, and the extent of charges to meet actual depreciation in roadway, buildings, structures and equipment will necessarily vary. They are dependent upon the nature of the original construction and character of the original equipment, the extent of the use, topography, climate, the relation between type and character of equipment and roadway construction, the extent of maintenance charges, the length of franchise rights and other matters of detail, and the establishment of an arbitrary or standard rule of depreciation in respect to roadway, buildings, structures and equipment will be of little value to anybody for any purpose.

Assume, if you please, that a corporation owns and is engaged in the management of a piece of real estate in a growing community upon which is located an office building; that the building depreciates in physical condition year by year, but the rents and value of the land each continue to increase. Would anyone contend for a moment that a proper system of accounting would require that the corporation reduce its book assets annually by the amount of depreciation of the building and limit its capacity to make returns to the owners of the property by such a system of accounting? There has clearly been no depreciation of the value of the property as a whole, as is evidenced by the increase of its rental production, and a theory or system of accounts which would require the charging off of depreciation of the property by the extent of depreciation of the building while a progressive increase of the rental and salable value continues inflicts an injustice upon the present owner, whatever may be its effect upon the distant future owner.

We assume that it is not the purpose of any board or body to take the position that any future increase in the value of the real estate and franchises of a street or electric railroad corporation belongs wholly to the public, and not to the stockholders, and that the latter should be deprived of the benefits of any such increase in value. If the owners of these properties are entitled to a fair share of the benefits accruing from the growth of the communities in which the properties are located, and from the increase of the business of the company, then the question of the amount of depreciation to be charged (under perhaps some public regulation to prevent a waste of the property) should be wholly left to the discretion of those to whom the owners have intrusted its management.

Effect on the Present.

The mandatory establishment of depreciation accounts in any form would have a discouraging effect upon those progressive spirits who have been responsible for the extraordinary development of electric railways in this country. It would be an exceptional experience for a street railroad that it should from the commencement of its operations be able to pay its fixed charges, and it would be extraordinary for a street railroad to be able from the commencement of its operation to pay its fixed charges and a dividend upon its stock.

The result of the establishment of fixed arbitrary and mandatory depreciation charges may be to serve notice upon any projected enterprise of this character, that under no possible conditions will it be able to remain solvent, if it is constructed out of the proceeds of bonds whose interest constitutes a fixed charge upon its property; and, therefore, unless it is prepared to face a series of years of deficits, the enterprise should be abandoned at its inception.

As to the existing properties, the mandatory depreciation accounts will prevent the continuance of dividend payments in the few instances where such payments are now made, and in respect to the others will either involve the exhibition of a deficit in its income account or so slight a surplus as to in

either event limit its capacity to obtain further moneys for necessary extensions, betterments and improvements.

Sixty-one of the 72 companies in the second district paid no dividends during the year ended June 30, 1906, and the surplus for that year showed a narrow margin above expenses and fixed charges in almost every case.

It is but fair for the committee to acknowledge its belief that the charging off of a sum for depreciation would give to the company a credit and reputation of stability that would be of value, but this credit and reputation would not overbear in the minds of investors the fact of an actual deficit shown or a discontinuance of dividends heretofore paid; and the amount of the charge for depreciation for this reason, as well as for the differences in physical and operating conditions above given is a matter that should be determined (subject always to the control of the commission) by those in charge of the management of the property.

The committee does not deny that possible benefits may accrue to the street railway companies in their relations to the public, from the keeping of some depreciation account, and at the meeting of the Street Railway Association of the State of New York, at which this committee was appointed, the committee was authorized to attempt to procure the establishment of a permissive depreciation account, to be treated as a deduction from income.

Proposed System of Depreciation Accounts Should Not be Adopted.

It is respectfully submitted that the number of the separate accounts for depreciation, each of which must be based upon an estimate solely, is a theoretical and technical structure, which in actual practice is more than likely to collapse. Separate and definite depreciation accounts for the various portions of the property, as set forth in the tentative classification, could be used only for the purposes set forth therein and could not be transferred from one account to the other, as occasion might require.

It is further respectfully submitted that the prices of equipment and of material, and the total construction cost upon which depreciation is to be charged varies greatly in different years, so much so, in fact, that we have seen certain kinds of second-hand material sell within recent years for more than its original cost new. Under full and complete maintenance charges it might be fairly said that there could be no depreciation, and the inevitable result of fixed depreciation charges along the lines of the tentative classification will be to prevent the prompt adoption of the newest methods and equipment because of the existence of the depreciation accounts. We think it cannot be claimed that fixed monthly charges for depreciation are theoretically correct, since that part of depreciation which is due to use is greatest when use and earnings are the greatest, and since use in each month is not constant and uniform, by the same sign depreciation due to use is greatest in the month when use and earnings are greatest. All depreciation is, of course, not due to use, and the above argument would not apply to depreciation due to lapse of time obsolescence, casualty and other causes unrelated to actual use.

A single depreciation account or fund established and continued as the condition of the railroad and the judgment of its directors might require, created and used for the replacement of all or any portion of the property according to the judgment of those intrusted with its management, is all that ought, from any point of view, to be included in any classification imposed or adopted by governmental officials. Accounts are records of the past and present, while depreciation deals largely with the future.

The establishment of any depreciation accounts at the present time is revolutionary enough. Some companies have taken steps in the direction of the establishment of such accounts. They are for the most part the older and better established railways, and the charges in these instances for depreciation have been usually based upon a percentage of the gross revenue.

It is the unanimous and unqualified judgment of the members of the committee, all of whom have had large experience with electric railway operation management or accounting, that the present establishment of depreciation accounts along the lines contained in the tentative classification should not be made, and that the adoption of the tentative classification in this respect would work a serious hardship and injustice upon the street railway corporations, their bondholders, their stockholders, their future development, and upon the traveling public, and the communities which these corporations serve.

It is respectfully urged that the postponement of a determination upon this exceedingly important subject is, in view of existing financial conditions, highly desirable, and that a gradual evolution, rather than a radical revolution, in treating and disposing of the matter of depreciation will be for the ultimate benefit of all, and presents the correct method of solving the problem.

Conclusion.

The committee would be glad to supplement this brief, at a hearing to be appointed by the public service commission, where such formal or informal discussion of the questions presented by the brief as the commission may think of value, could be had.

The committee begs to acknowledge the courteous treatment of the commission in permitting the presentation of the views of the committee on behalf of the Street Railway Association, and solicits such further action on the part of the commission as shall avoid the various serious difficulties and disasters which the committee believes would follow the adoption of the tentative classification contained in Circular No. 20 of the interstate commerce commission.

REPLY TO INTERSTATE COMMERCE COMMISSION'S ACCOUNTING CIRCULAR.

BY M. E. STARRING, PRESIDENT NORTHWESTERN ELEVATED RAILROAD, CHICAGO.

Referring to Accounting Series Circular No. 20 and the questions submitted by the interstate commerce commission this company begs to submit the following statement: That it recognizes that the questions were formulated for the consideration of so-called interurban electric railroads; that is, as we understand it, those railroads organized under the general railway act and reporting to the state railway commissions. We therefore feel that suggestions or criticisms from us should be made with a view solely to the application of these questions and the proposed standard of accounting to elevated railroads only.

Referring to the tentative classification issued by the American Street and Interurban Railway Association, with a view to obtaining from the companies interested therein data regarding the availability or lack of availability of 116 numbered accounts and 6 clearing accounts, this company begs to report that 37 of said accounts are not applicable in any way to the business transacted by this company; that the division of some of the accounts, such as those numbered 80 and 81, would entail upon this company a large increased bookkeeping expense without, so far as it can see, aiding in any way in any needed comparison. As to some of the accounts the charges thereto would amount to less in dollars and cents than the value of the time for the clerk employed in making them; for instance, "Bridges, Trestles and Culverts," of which this company maintains one, which so far has cost nothing for maintenance; the company considering that the depreciation thereon is taken care of in its general depreciation account.

With regard to the line of demarcation based upon the annual gross receipts, while this company would not be affected thereby, it nevertheless believes that to compel companies with annual gross receipts of under $50,000 to keep and carry out such an elaborate distribution of accounts would cost the companies more than any possible saving to them or good to the public could warrant. If a line of demarcation is to be observed we respectfully submit that the line should be drawn at annual gross receipts of $1,000,000.

The approximate aggregate charge to operating expenses for the year ending June 30, 1908, resulting from the application of the theory of depreciation to the equipment of this company, as outlined in Account No. 59 (a), would amount to $24,427.92; that being the amount which it is estimated would amortize the original investment at the end of 25 years. As this company endeavors to maintain its equipment at 100 per cent good, the depreciation upon its equipment for utility would be practically nothing. It is uncertain what, if anything, should be charged for depreciation for style.

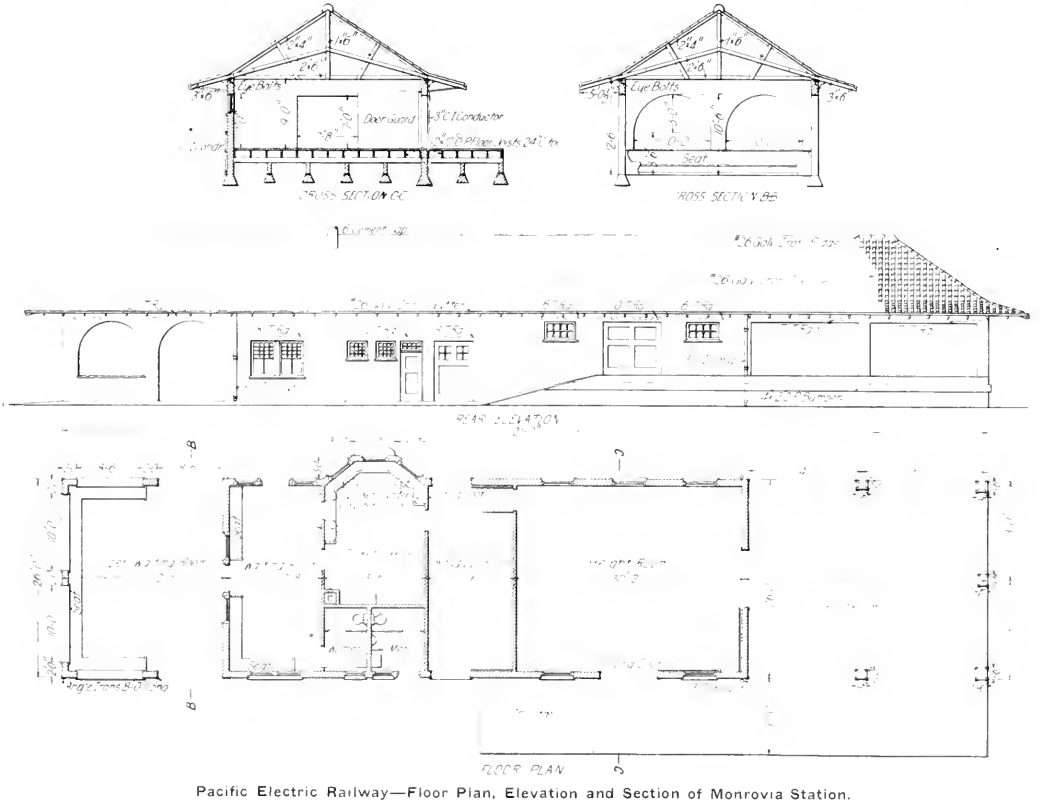
It is announced that the Northwestern Elevated Railroad will begin operating trains over the new Evanston extension on Saturday, May 16.

MONROVIA STATION OF THE PACIFIC ELECTRIC RAILWAY.

The Pacific Electric Railway of Los Angeles, Cal., has recently completed a handsome concrete passenger and freight station at Monrovia, Cal., which is illustrated in the accompanying engravings. In general the details of the building correspond closely to the company's standard type for suburban passenger stations. It is located at the southeast corner of Myrtle and Olive avenues. The building is 121 feet long and with the concrete platforms occupies a space 26 feet wide.

The principal features of the construction are shown in the drawings presented herewith, for which we are indebted to George E. Pillsbury, chief engineer of the Pacific Electric Railway. Both the foundations and the walls are of concrete, all openings being reinforced by T-rails, varying from 6 to 21 pounds per yard in weight. All corners are protected by angle iron. The roof is of galvanized iron tiling painted red.

Pacific Electric Railway—Standard Concrete Station at Monrovia.



Pacific Electric Railway—Floor Plan, Elevation and Section of Monrovia Station.

The walls are painted buff, with brown trimmings, giving a very pleasing effect.

Except in the open waiting room, which has a cement floor, the flooring is of Oregon pine boards. In the waiting room and the ticket office a wainscot extends to a height of 3 feet 7 inches. The baggage room has a wainscot 8 feet high.

The accommodations consist of open and closed waiting rooms, toilets, ticket office, telegraph office, baggage room, freight room and a platform for the loading and unloading of freight matter. At the rear of the building an incline leads to the platform for the handling of freight. Facilities are also provided for the handling of express matter by Wells Fargo & Co., a portion of the baggage room being set apart for this purpose.

CONDITION OF THIRD AVENUE RAILROAD, NEW YORK.

F. W. Whitridge, receiver of the Third Avenue Railroad of New York, has sent a report to the bondholders' committee concerning the disclosures made by investigation of the property and the prospects held out by the future.

Regarding the recent abolition of transfers between lines of the Third Avenue road and the Metropolitan Street Railway, Mr. Whitridge says: "The result to some extent has been disappointing, as the number of passengers carried has fallen off during the first few days something like 60,000 a day. The receipts, however, remain about what they were, and I am hopeful that a part, at least, of the passengers who have abandoned us will return." Mr. Whitridge stated that he is preparing a petition to the United States circuit court for permission to abolish transfers in the Bronx with the Manhattan elevated road.

Mr. Whitridge estimates that $4,056,000 should be spent on the property within a short time to build an extension and provide, among various additions, the following: 250 to 300 new cars, at a cost of about $1,500,000; new substation for the Union Railway at One Hundred and Sixty-first street, $225,000; repairs on substations, $109,000; putting old cars in first-class order, $300,000; new cars ordered, $300,000; repairs to track, $436,000; substation at Kingsbridge, $225,000; repairs to buildings, $151,000; and a club for employes.

In referring to funds received from the sale of bonds of the Third Avenue road, Mr. Whitridge said he had ascertained from bankers that checks for $17,000,000 from the National City Bank, $17,564,444 from the National Bank of Commerce and another for $1,943,000 were turned over to the company. In his judgment there is "no evidence on earth or under the earth of the expenditure of any such sum of money on the system."

The auditor appointed by the receiver had reported that more than $20,000,000 of the money was expended prior to the lease to the Metropolitan company upon work, part of it done by contract for which the contractor's pay was 15 per cent on the cost. Mr. Whitridge continued:

As respects the balance of the money I have not found and no one has furnished me with evidence of misappropriation, waste or peculation. I believe, generally speaking, that everything which has been done can be traced, but to endeavor to track the whole of the money would cost possibly $200,000. There would be no certainty after I had tracked it that I should be able to recover any part of it for the bondholders or the company. Under these circumstances I deem it my duty not to undertake any suits or proceedings of any kind in respect to the expenditure of this money.

The company has claims against the Metropolitan Street Railway and the New York City Railway companies in large amounts, but Mr. Whitridge can perceive "no very great use in obtaining judgments." He added:

No such judgments could be collected. They would only share in the foreclosure sale of the Metropolitan, and, as has been very well said, they would represent practically only "stage money." If some provision can be made for the settlement of the franchise taxes by the receivers of the Metropolitan road and for the refunding to me of the cash collected upon the Third Avenue road subsequent to the date of the last payment by the Metropolitan under the lease, less the cost of operation, I think it would be good business and a great economy of time, temper and legal expenses for all these claims on both sides to be abandoned.

Mr. Whitridge said that when he took charge as receiver the company had no offices and no supplies; that its shops had been neglected for years and that the tracks and cars were in very bad shape, the power house only being in good condition. Of the 567 cars turned over to him by the New York City Railway there was only one which did not need immediately some repairs.

The replies of Mr. Whitridge to orders of the public service commission, first district, attached to the report, comment caustically upon the work of the commission. In response to an order for 360 new cars in less than 90 days, Mr. Whitridge wrote:

If you have anybody on your staff who can show us how to get material before the manufacturers will agree to furnish it, and who can turn out 360 cars in this Third avenue shop between now and May 1, I will pay him any salary you will fix to take charge of the job until that date; otherwise I am obliged to say to you that, with the best will in the world, I canont comply with order 269. The only thing I can say is that to the extent of my capacity I shall be only too glad to come as near to the terms of that order as possible.

Respecting the general utility of the commission Mr. Whitridge said:

Almost any commission, however inexperienced or ill-informed, would have been a boon to the investing public and the Third Avenue Railroad during the seven or eight gay years of the Metropolitan's misspent life. The commission which now exists will also doubtless prove useful; it has not spared expense nor shunned publicity in its desire to serve the public. It has directed to me orders of one sort or another on an average of one every five days, and I annex copies of some of my replies thereto so that those who undertake the reorganization of this property may judge of the degree of assistance or hindrance they are likely to meet from the public service commission. However useful it may become it is the fact that so far as the Third Avenue Railroad is concerned, the public service commission has, as yet, with the exception of a trifling suggestion about insulating certain wires under the cars, proposed nothing novel; has hastened nothing which we were trying to do and has accomplished nothing at all, except to give me a little more trouble, "of which," as the late Mr. Dingley observed of books printed in foreign languages, "we already have a sufficiency."

CENTRAL ELECTRIC RAILWAY ASSOCIATION.

F. D. Carpenter, president, announces that the next regular meeting of the Central Electric Railway Association will be held at the Boody House, Toledo, O., on Tuesday, May 26, 1908. This being the last regular meeting until September 24 it is hoped that as many as possible will be in attendance, as the "Mileage Book" and "Traffic" committees will make their final reports and it is desirous that some definite action be taken so that the work may be carried on during the summer.

The programme will be as follows:

Morning Session.

10 a. m. Order of business.

11 a. m. "Insulation of High-Tension Transmission Lines." Paper by Francis S. Denneen of the Ohio Brass Company, Mansfield, O.

12:30 p. m. Adjourn for lunch.

Afternoon Session.

1:30 p. m. "Merit and Demerit System of Discipline." Paper by Frank Hardy, superintendent Ft. Wayne & Wabash Valley Traction Company, Huntington, Ind.

2:30 p. m. "Tickets as a Fare Medium for Street and Interurban Railway Traffic." Paper by John F. Ohmer, president The Ohmer Fare Register Company, Dayton, O.

3:45 p. m. "Employers' Mutual Benefit Association." Paper by H. E. Vordemark, auditor Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.

ANNUAL CONVENTION SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION.

The fourth annual convention of the Southwestern Electrical and Gas Association was held on May 7, 8 and 9 at the St. Regis hotel, El Paso, Tex., and in point of attendance and exhibits of supply houses was the most successful ever held by the association. The application of 13 companies for membership in the association was accepted. The attendance was 140, of whom 27 were ladies.

Thursday Session.

The convention was called to order on Thursday morning, May 7, by President H. T. Edgar, vice-president and manager of the Northern Texas Traction Company, Ft. Worth, Tex. Hon. Joseph U. Sweeney, mayor of El Paso, made the address of welcome, which was responded to by H. S. Cooper, manager of the Galveston Electric Company. The president then read his annual address, giving a résumé of the work of the year and making several recommendations for the good of the association, which may be summarized as follows:

That meetings of the executive committee be held at least twice a year.

That the work of the secretary in collecting and classifying data regarding taxes, donations, etc., paid by the member companies be continued, and also that the secretary arrange in the future to collect and classify other information of general interest to the members of the association.

R. B. Stichter, President-Elect.

That the past records of the association be printed and sent out to the members.

That future conventions always arrange suitable exhibit space to be furnished free for the use of associate members.

That an assistant secretary be appointed, to be paid by the secretary and to maintain an office in Dallas.

That certificates of membership be furnished to the members of the association, with the request that they be framed and put up in their offices.

That a committee of four be appointed for the purpose of fostering closer relations with the national and other societies.

That a committee on municipal ownership be appointed.

A committee of five was appointed to act upon the recommendations contained in the president's address. The programme was then taken up. Mark Lowd, southwestern manager of the Stone & Webster Engineering Corporation, Dallas, Tex., had prepared a paper on "Track Construction," which is published elsewhere in this issue. In the absence of Mr. Lowd the paper was read by C. H. Ladd of Ft. Worth and was followed by a discussion. J. A. Myler, Jr., then read a paper on "Testing and Proving Gas Meters." After a discussion of the paper the meeting adjourned until 2:30 p. m.

The first order of business at the afternoon session was a discussion on "What Policy Should be Pursued by Public Service Corporations in Making Extensions," which was participated in by representatives of the electric railway, lighting, telephone and gas interests. The remainder of the afternoon was devoted to a discussion of the "Question Box," edited by Samuel Kahn of San Antonio, Tex. Extracts from the "Question Box" will be found elsewhere in this issue.

Friday Session.

The Friday morning session was opened with a paper on "Gas Producers and Gas Engines," by W. B. Tuttle, vice-president and general manager of the San Antonio Traction Company. In Mr. Tuttle's absence the paper was read by Mr. Kahn. Mr. Tuttle's paper was published in the Electric Railway Review of May 9, page 571. Prof. E. P. Schoch of the University of Texas read a paper entitled "A Review of the Present Practice and Economics of Timber Preservation." This paper was published in last week's issue, page 568. This paper was received with great interest by the members present and discussed for fully an hour. H. S. Cooper, manager of the Galveston Electric Company, presented the report of the committee on standardization of the high T-rail. The report recommended that the secretary be instructed to address a letter to the American Street and Interurban Railway Association, stating the attitude of the association in behalf of a standard T-rail and suggesting that the national association secure from minor associations and the railroads statements in behalf of a standard rail. At the afternoon session the "Question Box" was further discussed and considerable time was devoted to a consideration of the automotoneer. The supply men then took charge of the meeting and Samuel Hobson, representing the supply men, took the chair yielded by President Edgar. The meeting then adjourned to the exhibit rooms to inspect the exhibits in a body.

Saturday Session.

At the Saturday morning session a paper was read by C. W. Kellogg, Jr., on "Electric Illuminants and Their Efficiency." President Edgar then announced that Bernard V. Swenson, secretary and treasurer of the American Street and Interurban Railway Association, was present at the meeting. On being invited to address the convention, Mr. Swenson spoke of the work of the American association and urged the members of the Southwestern association to affiliate more closely with the national organization. He reviewed the work of the American association and the allied organizations and commended the Southwestern association on its ability to handle local matters in a way impossible for a general organization.

Invitations for the next meeting of the association were received from Houston, Beaumont, Amarillo, Ft. Worth, Yoakum and Dallas, Tex.

The committee appointed to act on the recommendations contained in the president's address submitted a report in the form of resolutions recommending that they be adopted by the association. The treasurer's report was read, showing that there was a balance in the treasury of $887.86.

Election of Officers.

The nominating committee then announced its recommendations for officers for the ensuing year, and the following were unanimously elected:

President, R. B. Stichter of the Dallas Securities Company, Dallas, Tex.

First vice-president, W. B. Tuttle, vice-president and general manager San Antonio Traction Company, San Antonio, Tex.

Second vice-president, W. B. Head.

Third vice-president, Joseph E. Carroll.

Secretary, J. A. Myler, Jr., Dallas, Tex.

Treasurer, A. E. Judge, president and general manager Tyler Electric Light & Power Company, Tyler, Tex.

Executive committee, H. T. Edgar, Ft. Worth; H. M. Moore, Austin; E. L. Wells, Taylor; F. M. Lege, Jr., Galveston; A. E. Judge, Tyler.

The entertainments, which were provided by the El Paso Electric Company, included a tally-ho ride through El Paso and Juarez, Mexico, for the visiting ladies on Thursday afternoon; a visit to the largest smelter in the United States in special cars on Thursday evening; a trolley ride and luncheon at the Country Club for visiting ladies on Friday afternoon; and a reception and band concert at Ft. Bliss on Saturday afternoon. On Friday evening there was a "Rejuvenation of the Sons of Jove."

T-RAIL TRACK CONSTRUCTION.*

BY MARK LOWD, SOUTHWESTERN MANAGER STONE & WEBSTER ENGINEERING CORPORATION.

T-rail construction is the type which the writer believes to be the best for the operating companies from the standpoint of first cost and economy of operation. In many cities the type of rail is designated by ordinance, unfortunately in most cases specifying grooved rail. These ordinances are largely the result of a lack of attention and inexperience on the part of the railway companies in the early days of electric traction.

As traffic grew the manufacturers gave us the girder rail of greater height and weight, in various forms, and the grooved rail, also of greater weight. It is probable that the first good results in paved streets were obtained by the use of the girder and grooved rails, and this is the principal reason that so many cities demand the use of such rails today.

With the increase in weight and height of the T-rail occasioned by the needs of the steam railroads for heavier rail to meet the requirements of high speed and greater weights, there came an opportunity to demonstrate that the T-rail could be used in any kind of a paved street with excellent results, both in regard to car operation and maintenance of roadway.

The T-rail has many advantages over either the girder or grooved types, and no disadvantages that are known to the writer. The T-rail is preferred for the following reasons:

(1) It is designed on better mechanical lines; there is no eccentric loading as in the case of the grooved rail.

(2) There is no excessive waste of metal when heavy traffic and large wheel flanges are to be considered. In many cities grooved rails weighing from 125 to 150 pounds per yard have been used, where an 80 or 90 pound T-rail would have been sufficient.

(3) The flange way is always ready for an increase in the size of wheel flanges of the local cars, or for the interurban car with the large flanges necessary for high-speed work.

(4) The T-rail is not so noisy.

(5) Car wheel maintenance is less.

(6) It has a longer life, particularly at the joint, which is the vital point of any rail.

(7) It is more easily handled, and high-priced shop curves are unnecessary.

Considerable discussion has taken place on the question of the use of standard T-section instead of the high T or Shanghai sections.

The standard section has the advantage of lower cost, being some eight dollars a ton less than the high T, so that for the same money one can get a heavier rail by the use of the standard section.

But with any character of paving the height of the rail should be considered first, and unless an excessively heavy standard rail is used, say from 90 to 100 pounds per yard, which in most cases is unnecessary, the needed height can be obtained by using a lighter section of high T-rail.

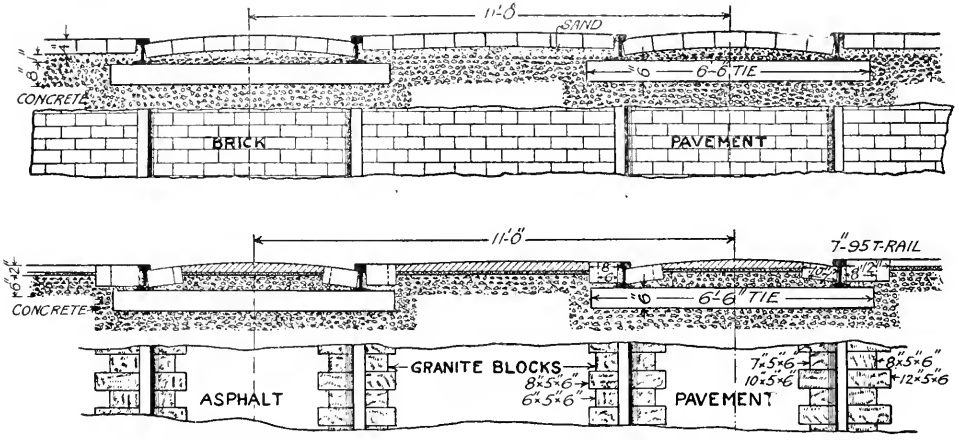
A 7-inch T-rail is recommended as giving the necessary height. The base of the rail can be well embedded in the concrete, thus increasing the rigidity of the rail and preventing to a great extent the loosening of spikes and other fastenings. Even with the use of a 90-pound standard section the necessary height to give the best results can hardly be obtained.

It is admitted that the standard section is mechanically stronger and has more metal in the head, with consequently a slightly longer life, but after considerable experience with many kinds of pavement the writer believes that the 7-inch T-rail meets every requirement.

In this connection attention is called to the fact that the use of the 7-inch T-rail was recommended by the committee on "Rails" at the 1907 convention of the American Street and Interurban Railway Association.

Roadbed.

Both the "tie construction" and the "stringer construction" may be used with the concrete foundation, though the concrete stringer construction should not be used unless the subgrade is well drained and of good hard sand or gravel. The "tie construction" is always reliable, and will be considered in this article, time and space preventing a discussion of the "stringer."



Cross Sections of T-Rail Track Construction in El Paso, Tex.

The subgrade should be well drained; this is very important, but in some places local conditions make it nearly impossible. The subgrade should be well tamped or rolled; tile and gravel drains connecting to sewers or other outlets should be used when necessary to improve drainage.

Ties should be of good sound timber, untreated if completely encased in concrete, spaced on 3-foot centers, using a "brace tieplate" on every third tie. This will do away with the use of the tie rod, which is objectionable where brick or stone paving is used.

Concrete should be made of one part of best quality Portland cement, four parts of clean sharp sand, and seven parts of clean gravel or crushed stone, and should be allowed to set at least seven days. If, on account of operating conditions, it is necessary to use the track sooner, and this condition is frequently met with, see that the track is solidly blocked up and that double the proportion of cement is used. Don't hurry operation over fresh concrete if it can be avoided. Many a track has been ruined by too early use.

The concrete should not be less than 6 inches in depth under the ties, and should extend around and above the ties, completely encasing them and the base of rail. Carry the concrete as high as the paving brick or block will permit, leaving half to three-quarters of an inch for cushion. A 2-inch cushion, commonly used, is unnecessary, and the space had better be occupied by concrete. Put the concrete in place as wet as it can be handled without losing the cement by washing away. It will flush better around the ties and rail and will produce the best results. Tamping concrete under the ties and rail is an uncertain problem, depending too much on the human element.

*Abstract of paper read before Southwestern Electrical and Gas Association, El Paso, Tex., May 7, 8 and 9, 1908.

Rails should be 60 feet in length; these cost $2.00 more per ton than the 30-foot length, but this is offset by the saving in number of joints and bonds. Even if the difference in price was much greater, the immense advantage of elemination of one-half the joints and bonds, which spell trouble with a big "T," fully warrants the increased cost of the 60-foot rail over the 30-foot rail.

The weight of rail should be governed by the traffic, and it is important to consider the team traffic as well as the car operation and weights. Heavy trucking will affect the condition of the rail to a great extent, and a heavier rail is necessary in streets where the team traffic is considerable than in a street where the car service and weights are the same, but where there is little teaming.

Of course, it is very difficult to determine what the future car operation or team travel may be in many cases, but as a general proposition, the experienced manager can judge what the travel is likely to be for many years to come. For residential streets, or other streets where light travel can be reasonably expected, a 70-pound 7-inch T-rail is suitable. In streets where travel of all classes is heavy, or likely to be in a short time, the 80-pound 7-inch T-rail should be used. Where extreme conditions of car and team traffic prevail, as in the business centers of large cities, it would be advisable to use a 95-pound 7-inch T-rail.

It must be remembered that the life of the rail is governed by the life of the joint. Likewise, the condition of the joint is responsible to a great extent for the condition of the bond. It is extremely difficult to maintain any kind of a bond at a loose joint.

The angle bar is not much better than the ancient fishpate, and in every case a continuous joint should be used in preference to the angle bar, which is so much in evidence on bad joints.

There are several types of soldered and compressed terminal bonds which may be used with good results, though local conditions must be considered in connection with the selection of bonds. Conditions of soil and climate have rendered the use of soldered bonds impracticable in a few instances. A concealed bond applied to the web of the rail, under the joint plate, gives general satisfaction, and is not easily stolen.

For any kind of traffic the "hardened center" special track work, which is made by several reliable concerns, is the best and most economical in the end. "Built up" or "home made" special work is only temporary construction at the best.

One-inch bolts of the best quality, and spikes $\frac{9}{16}$ by 5 inches, also of good material, should be used with all weights of rail recommended.

Paving.

A good vitrified brick or paving block makes a most satisfactory form of pavement, especially in the south and southwestern country. If asphalt or bitulithic pavement is used, do not under any circumstances permit the asphalt or bitulithic to be laid against the rail. Use a brick or stone liner against the rail. This will not only permit the tightening of a joint bolt or the renewal of a bond without disturbing the adjoining pavement, but will also make a more durable job. The use of the special or "nosed" brick is unnecessary and rather unsatisfactory.

The regular brick laid as shown in the illustration of the cross section of T-rail track will give far better results. This construction has been used with great success in Milwaukee and other large cities. A rich cement grout makes the most satisfactory filler for brick or stone pavement.

The cost of track with this form of construction, the paving requirements being eight feet in width, will run from $5.25 to $6.75 per lineal foot of single track, varying with the cost of materials, weight of rail, wages and character of labor and local conditions on each job.

There are a few cities having a good sandy soil, where excellent results have been obtained in brick paved streets without the use of concrete foundation. This is very satisfactory in residential streets, but is not advisable in the important business thoroughfares.

The Maryland Electric Railways Company has begun the operation of electric trains on the Baltimore & Annapolis Short Line, a former steam road 27 miles long, from Baltimore to Annapolis, Md. Several electric trains are run daily between Annapolis and Cliffords, four miles out from Baltimore, but the line is not yet prepared to continue the electric service into Baltimore, and steam locomotives take the trains from Cliffords to the city terminus at Camden Station. Steam trains will be gradually superseded by electric trains until the entire service is conducted by electricity.

SOME QUESTIONS WITH ANSWERS BY PRACTICAL MEN.

We desire to compliment the Southwestern Electrical and Gas Association on the excellent "question box" which was presented at its El Paso convention. The question box with its answers comprised a book of nearly 200 pages, $5\frac{1}{2}$ by 9 inches in size. The questions were well chosen, the answers were of practical value and the whole must have required a vast amount of work on the part of the "question box" editor, Samuel Kahn, resident engineer San Antonio Traction Company.

A number of the questions (with original numbering) and answers of timely interest to electric railway operators follow.

C-4. What effect does the injection of heated air over the fire have on smoke prevention or on fuel economy and what temperature must the injected air have in order to produce the best results?

Air is essential and best admitted through the grate bars to the furnace in innumerable line jets, since gas and air mix only gradually. Air in bulk mixes only superficially with gas, and, by abstracting heat, cools the furnace. Gases to be thoroughly burned in the furnace must be intercepted at the start, else the combination, which is at best gradually, will not be completed in season. A proper amount of air entering the furnace above the fuel in small quantities assists somewhat in the combustion of the gases, but a great quantity is detrimental and injurious. I think if the fuel is not put in too thick a layer no necessity for such introduction of air is necessary. There are certain practical objections to heating the air supply for boiler furnaces. First, for every 480 degrees F. of added heat its bulk is enlarged by the amount of its original volume so that at 3,000 degrees, the heat of the interior of the furnace, it has six times its original volume. It is consequently, more unmanageable; and as its contained oxygen retains the same weight, its mixture with the gas becomes more difficult, while when mixed it can only do the same work as before. I think it would be much better to condense the air than to expand it. Next, if heated by passing through flame or over burning coal, the air will be robbed of a greater or less part of its vital oxygen. This is a positive loss.—J. B. Baltimore, Hillsboro.

Has a beneficial effect, and should have a temperature of not less than 2,400 degrees where coal is used. Will prevent smoke under proper conditions, but furnaces of this kind are rather expensive, and the same or better results can be obtained by other arrangements.—A. C. Stucky, San Antonio.

C-6. What is the saving in one of the modern waste cleaning machines?

I know of no more modern waste-cleaning machine other than the one I am using. I made it and never saw one like it, and will explain it to any one interested. My oil and waste cost for February, 1907, was $13.15, and with this machine, for February, 1908, it was $3.25, cost of lubricants and waste including engine and cylinder oil, which is $\frac{1}{4}$ mill per kilowatt or $\frac{1}{2}$ cent per hour for 24-hour service.—E. D. Kelly, Hillsboro.

If the man in charge of the waste-cleaning machine operates it in a competent manner there should result a saving of 75 per cent in waste. The amount of oil that is obtained by wringing the waste, that can be filtered and reused, is considerable.—J. C. Marshall, Laredo.

You can save more of the oil contained in the waste by first pressing it. By using both press and machine should save three-fourths of waste bill, besides the oil saved.—E. L. White, Ft. Worth.

The saving due to the machine of the Oil & Waste Saving Machine Company should be about 30 per cent in oil and about 50 per cent in waste.—El Paso Electric Railway Company.

Have obtained 80 per cent with centrifugal machine.—J. R. Cox, Ft. Worth.

G-1. If the length and size of the top of a pole is decided upon what specifications further should be given to obtain a reasonably straight and round pole?

We specify that white cedar poles must conform to the specifications of the Northwestern Cedarmen's Association, as follows:

"Poles must be cut from live growing timber, peeled and reasonably well proportioned for their length. Tops must be reasonably sound and, when seasoned, must measure as follows: Five-inch poles, 15-inch circumference; 6-inch poles, $18\frac{1}{2}$-inch circumference; 7-inch poles, 22-inch circumference; and 8-inch poles, 25-inch circumference at top end.

"On poles 4 inches, 16 and 18 feet long, a 1-way sweep of 4 inches and on poles 4 inches, 20 and 25 feet long, a 1-way sweep of 5 inches is allowable. On sizes 5 inches, 25 feet and upward, 1-way sweep, allowable not exceeding 1 inch for

every 5 feet; for example, in a 25-foot pole, sweep not to exceed 5 inches, and in a 40-foot pole, 8 inches; in longer lengths, 1 inch additional sweep permissible for each additional 5 feet in length. Measurement for sweep shall be taken as follows: That part of the pole when in the ground (6 feet) not being taken into account in arriving at sweep, tightly stretch a tape line on the side of the pole where the sweep is greatest, from a point 6 feet from butt to the upper surface at top, and having so done, measure widest point from tape to surface of pole, and if, for illustration, upon a 25-foot pole said widest point does not exceed 5 inches, said pole comes within the meaning of these specifications. Butt rot in the center, including small ring rot outside of the center, total rot must not exceed 10 per cent of the area of the butt. Butt rot of a character which plainly seriously impairs the strength of the pole above ground is a defect. Wind twist is not a defect unless very unsightly and exaggerated. Rough knots, if sound and trimmed smooth, are not a defect."

Experienced users have realized that rot as found in cedar poles is an incident of growth and not of decay; the latter indicated by the fact that the rot does not spread after the tree has been cut and that, thereafter, cedar is the most durable timber procurable for pole purposes.—W. W. Reed, Houston.

N-1. Can the largest cities of Texas profitably build their own cars if these cars are double-truck, semi-convertible type of the latest model?

The largest city in Texas, San Antonio, has tried building its own cars and found it unprofitable. If lumber yard ash, oak and other lumber is used, cars will shrink and become loose, and to provide sheds and dry kilns to have your hardwood seasoned as it should be would be an expense and an outlay far in excess of a regular car builder's profit.—T. C. Brown, San Antonio.

I do not think so, as not enough building would be done to keep experienced help and pay interest on machinery investment.—V. W. Berry, Dallas.

N-18. What is the better practice to use, solid or split axle gears, and why?

Under ordinary conditions split axle gears are preferable. The chief argument in their favor being that they can be removed without disturbing the wheel. The new 4-bolt gear has proved more satisfactory than the old 8-bolt type.—W. L. Weston, Ft. Worth.

Solid, by all means, as they eliminate all possibilities of broken bolts in gearing and can be installed at less expense than split gears.—V. W. Berry, Dallas.

Solid gears, for the advantage over split gears in not getting loose on the axle, and I would recommend them for that reason.—G. H. Clifford, Ft. Worth.

Solid, first cost less. No bolt to get loose and get between gear and pinion and delay traffic.—M. Miers, Houston.

Solid gears are better, as they have no bolts to work loose.—El Paso Electric Railway Company.

N-23. What can be done to decrease the number of cars pulled in daily for equipment failures?

Have one or more car inspectors out on the road. The writer has had such a man for the past four months, and he has decreased the pull-ins two-thirds. This man has nothing to do with schedules and discipline except the abuse of equipment by motormen. This he reports to the superintendent of transportation. The saving of shedmen's wages by making such a change, to say nothing of the interruption of traffic, more than pays the inspector's wages.—T. C. Brown, San Antonio.

Frequent and thorough inspection has eliminated most of our pull-ins; trouble with signal bells are attended to as far as possible while the car is in service.—W. J. Jones, Austin.

More careful and rigid inspection, better education of trainmen and by keeping systematic records of causes of failures.—V. W. Berry, Dallas.

Careful and systematic inspection, with systematic records thereof, is the proper solution of this question.—El Paso Electric Railway Company.

Keeping equipment in good condition and by close inspection at night.—G. H. Clifford, Ft. Worth.

Special attention to brush holders and spacing of same.—M. Miers, Houston.

N-24. What are you doing in regard to adopting the standards as approved by the American Street and Interurban Railway Association?

We are standardizing our equipment as far as possible with the type of equipment we now have, using those parts supplied by the manufacturer of the equipment in preference to purchasing elsewhere.—W. J. Jones, Austin.

Recommending adopting the standards as far as possible on all new equipment.—V. W. Berry, Dallas.

O-23. Porcelain and glass break strains are much cheaper than wood and composition break strains. What arguments are there in using a wood or composition break strain in a 600-volt trolley system?

Wood strain insulators possess the advantage that they are not easily broken. Have tested them wet up to 10,000 volts, using hydrant water. Leakage was very slight at 10,000 volts. Rain is generally pure, and pure water being a non-conductor, the properly filled hardwood strain insulator has a good field of usefulness.—J. R. Cox, Ft. Worth.

The advantage of a wood break strain is that in case of mechanical failure the break is plainly apparent, and no grounding of span or guy results through the device itself, which could happen with glass, porcelain or composition.—C. W. Davis, Dallas.

The newest form of porcelain break strains are the most satisfactory thing for this purpose.—El Paso Electric Railway Company.

Have been using glass strain insulators for four years and find them without an equal for this climate.—Flint McGregor, Houston.

P-6. To what extent should street inspectors look up accidents for the claim department?

Inspectors should not be permitted to do anything but inspect. If you require and have a claim department you should have sufficient force to tend to that department. However, when a serious accident occurs an inspector should go to the place of the accident at once to see that the schedule is maintained, and, of course, when there, if he can get the names of any witnesses that had not been procured by the conductor, he should do so, and caution the motorman not to talk. This is a caution that it seems has to be repeated over and over again.—T. C. Brown, San Antonio.

Inspectors should give every assistance to the claim department in looking up accidents, as this will put them in a position to judge for themselves whether or not the trainmen are at fault, and if the inspectors are educated along these lines it keeps them on the lookout for witnesses, and as they are with the crews the most of the time they can often get very valuable information if interested in this line of the work.—G. H. Clifford, Ft. Worth.

Street inspectors should give whatever information they may gather in connection with their regular duties to the claim department. We do not think it feasible for them to do anything further than this in the investigation of accidents.—Uriah Foss and R. T. Sullivan, Houston.

Think inspectors should get all the information possible in relation to an accident, which should be turned over to the claim department.—W. J. Jones, Austin.

R-29. What are the most forcible arguments that can be brought up before a city council for the repeal of a girder rail ordinance?

The opinion of city engineers and other similar officials is gradually getting, year by year, more favorable toward the T-rail in paved streets, and a thorough correspondence with city engineers all over the country will furnish a large amount of information on this subject. In El Paso the city council, after thoroughly trying grooved girder rail, have reached the conclusion that T-rail is preferable in paved streets and has officially approved this form of track construction.—El Paso Electric Railway Company.

Plan and Elevation of Underframing for New Motor Cars of the Metropolitan West Side Elevated Railroad, Showing Arrangement of Apparatus and Conduits.

COST OF WIRING AND INSTALLING CONTROL APPARATUS ON THE METROPOLITAN ELEVATED.

In December, 1906, the Metropolitan West Side Elevated Railway Company, Chicago, received 50 motor cars of a design which has now become standard. A year later 20 cars of this same type, built by the Pullman Company, were delivered. These have just been put into service. Through the courtesy of E. T. Munger, superintendent of motive power and equipment, we present a statement showing in detail the costs of material and labor required for installing Westinghouse electro-pneumatic control and general wiring on the last 20 cars. This statement follows:

Installation cost per car for—	Material.	Labor.
Bending, placing and hanging conduit for trolley and control wiring		$26.75
Installing control equipment	$68.87	32.08
Installing trolley wiring on car bodies and trucks	18.71	2.90
Total	$87.58	$61.73
		87.58
Total cost per car		$149.31

These figures were taken direct from the books of the company's auditor. The cost of material and labor for installing the control and wiring on the 50 cars delivered in December, 1906, as compared with that for the 20 cars delivered in 1907 show that the later work was done at less expense. For the later work the cost of material increased $2.44 per car, while labor decreased $11.79 per car, leaving a net decrease in the cost of installing the control and wiring of $9.35 per car.

The results of operating the first 50 cars during the past year have been so satisfactory that the wiring and electrical equipment on the 20 new cars has been installed in exactly the same way as on the earlier equipments. It is said that one of the principal reasons why this control wiring has been giving such satisfactory service is that all the parts are very rigidly attached to the framing. This security of attachment assures that there will be no vibration from which can result chafing or loosening of mechanical and electrical joints.

To illustrate the general arrangement of the control apparatus and conduits as installed in the Metropolitan shops we present the accompanying engraving reproduced from a line drawing. It will be noted that the conduits are carried through the steel framing wherever it is found necessary to make a workmanlike job. As a protection against fire the underframing, below which are the electrical conduits and all the apparatus except governors, is completely covered with sheet steel.

This standard type of motor car equipment was described and fully illustrated in the Electric Railway Review for February 9, 1907, page 180.

The length of the car body on the center line over end plates is 47 feet 7¾ inches; the distance between center of trucks is 33 feet 7 inches. The extreme width of the car over side sills is 8 feet 6 inches. The height of the car from top of rail to top of upper deck roof is 12 feet 10 inches, and the height of the car floor above top of rail (light) is 3 feet 10 inches. The cars seat 48 passengers.

In the construction of the underframe there are no center sills, and this assists materially in simplifying the arrangement of the auxiliary equipment under the car. The side sills are 9-inch I-beams weighing 21 pounds per foot and running the full length of the car. These are reinforced by 1¼-inch truss rods with 1⅜-inch turnbuckles. The end sills are 9-inch channels weighing 25 pounds per foot. These extend to the outer edge of the side sills. The body bolster is a box beam built up of plates and angles; it is 12½ inches wide and 9 inches deep. The beams which support the floor extend across between the side sills. They are 6-inch I-beams weighing 12¼ pounds per foot, with the exception of those nearest the bolster, which are 6-inch plate girders with 3-inch angle-iron flanges.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

When Several Passengers Signal to Stop Car.

Lanci v. Boston Elevated Railway Company, 83 Northeastern Reporter, 1.—The supreme judicial court of Massachusetts holds that if there were three persons who gave signals to stop a car at a certain street, of whom a certain passenger was the farthest from the conductor, the conductor could not be found guilty of negligence if he stopped the car on the signal of one of the others, without noticing her signal, and without knowing that she wished to alight.

Passenger in Dispute as to Payment of Fare May Refuse to Allow Another to Pay It.

Birmingham Railway Light & Power Company v. Lee, 45 Southern Reporter, 164.—The supreme court of Alabama says that there was a dispute between the plaintiff and the conductor of a car as to whether she had paid 10 cents fare to a point to which she wished to go, or only 5 cents to an intermediate point. When it became evident that the conductor was going to eject her from the car a fellow passenger offered to pay her fare, when she told him not to do so, but the passenger paid it. The plaintiff had the right to refuse to allow this other person to pay her fare. Such payment by her consent would have been an acknowledgment that she had not paid it, and the conductor was entitled to it, and in such case she would have been in duty bound to refund it to this outsider.

Car Running 150 Feet After Application of Brakes—Not Anticipating Negligent Operation of Car—More Cars at Moderate Speed Recommended.

Louisville & Southern Indiana Traction Company v. Short, 83 Northeastern Reporter, 265.—The appellate court of Indiana, division No. 2, holds that the fact that a car ran 150 feet after the brake was applied was relevant to the question of equipment, and tended to show that the brake or other equivalent apparatus was ineffective.

An adult is not necessarily negligent in failing to anticipate the negligent operation of a street car and the standard by which the conduct of a child is measured is not so high as that applied to the action of an adult.

Here a child crossing a track was struck by a car without a fender running at an excessive rate of speed, without apparent concern or precaution. It is extremely easy for companies operating street cars to avoid liability for damages on account of such occurrences as the one in question, and also to avoid killing either children or adults. This they can do by simply running cars at moderate speed, and keeping them under reasonable control. The necessity of rapid transit will be more completely served by moderate speed and a sufficient number of cars properly controlled than by fewer cars recklessly run.

Woman Getting on Running Board or Step Does Not Justify Emergency Stop.

Sheppard v. New York City Railway Company, 107 New York Supplement, 553.—The supreme court of New York, appellate term, says that the testimony of the plaintiff was that as the car on which she was a passenger neared the street corner she arose and signaled the conductor to stop. The conductor gave one bell and the car slowed up. She then got down on the running board of the car, ready to alight, and while she was in that position the conductor gave three bells and the car stopped with a jerk, which loosened her hold and threw her to the street. The conductor was also called by the plaintiff, and gave the same account of the accident, except that he added that, after giving one bell, his attention was diverted from the plaintiff by a drunken person, and that, upon turning back again, he saw her on the running board and "gave three bells to stop the car for fear she would step down." The trial resulted in a judgment for the plaintiff, from which this appeal was taken, based upon the refusal of a motion to dismiss the complaint upon the ground that the plaintiff's evidence showed that the conductor gave the three bells at a time when the plaintiff was in apparent danger, and for her protection, and that, even if he made a mistake in judgment, the defendant was not responsible therefor. But while the principle relied upon by the defendant was undoubtedly sound, the court does not think it applied to this case. There was no evidence that the plaintiff had extended her foot or made any preparation to alight, other than that she was on the running board. The only apparent danger to which she was exposed is present every time a woman gets upon the running board or step of a car ready to alight before the car comes to a complete stop. None of the cases called to the attention of the court has held that such a situation or any similar one calls for or justifies emergency action by a railway employe, and the court thinks that to say that this principle applied to the facts here would be to extend it to an unreasonable and dangerous length.

Duty to Trespassers, Adult and Infant—Child Sitting on End of Crosstie—Requirements of Motorman.

Birmingham Railway Light & Power Company v. Jones, 45 Southern Reporter, 177.—The supreme court of Alabama says it is settled by that court that it is the common law duty of a motorman, running a street car in a populous town or city, to keep a lookout for persons rightfully on the track and liable to be run over by the cars.

But as a general proposition it must be conceded that a railroad company owes to a trespasser no duty to keep a lookout for him. It must also be conceded that this doctrine, according to the Alabama decisions and to the weight of authority elsewhere, applies with equal force to adults and infants, except in cases where infants are enticed upon the track.

In this case an infant only 16 months old crawled to a crosstie laid on the surface of the earth and was sitting on the end of it when she was struck by a passing car. On the facts of the case and the principles of law adverted to the court cannot escape the conclusion that the plaintiff was a trespasser on the road.

However, it will not do to lay down, as an invariable rule applicable to all cases, that a railroad company owes no duty to trespassers. Conduct which might, under one set of circumstances, show that all ordinary and reasonable care and diligence had been observed might, under a different set of circumstances, be insufficient to show an observance of such care and diligence. Such rule could mean no more than this: Taking the locality where the car is running, and all the attendant circumstances, if those in control of the movement of the car have no reason to apprehend that there may likely be a human being on the track in front of it, they are under no duty to one who in fact may be there, until they have actually discovered that he is there.

If, from the locality or attending circumstances known to the company, there is no reason to apprehend that the track in front of the car may not be clear of human beings, then it would seem it is the duty of the employes of the company to keep a lookout ahead of the car. This, it seems to the court, is a safe and conservative judicial principle—one which will conserve human life and at the same time place no burden on the company.

Whether the motorman was under any duty to keep a lookout for the plaintiff or not if he discovered the plaintiff's peril in time to prevent injuring her and he negligently failed to use the means or appliances at his command to prevent the injury, and the injury resulted from such failure, by all the authorities liability for the injury would be fixed on the defendant.

News of the Week

Accidents in Indiana.

The report of the Indiana railroad commission for January, February and March, 1908, shows that 71 persons were injured, 9 fatally, on the interurban lines of the state during the quarter. During the first quarter of the fiscal year 34 persons were injured, 8 fatally, and during the second quarter 70 were injured, 14 fatally. The accidents are classified as follows: Passengers, 57; travelers on highways, 5; travelers on foot, 3; employes, 6; trespassers, 3.

Electric Railways in Michigan.

In the twenty-fifth annual report of the Michigan commissioner of labor for the year ended June 30, 1907, just issued, interesting and valuable data concerning the electric railways of the state are given. The report shows that there are at present 23 electric railway companies in the state, operating 1,253 miles of track. Of the total number six companies operate entirely inside of cities, four are entirely interurban, but have city connections, and 13 are both city and interurban. The amount of capital stock outstanding is $38,031,000, an increase over 1904, the date of the last report, of $3,956,000. During 1907 20 companies made improvements costing $2,133,767. Six companies built new track amounting to 20 miles.

The total number of passengers carried was 222,788,795, the receipts from passenger service amounting to $9,717,473.95. Fourteen lines reported receipts from freight traffic, the total amount received from this traffic being $533,329.75. Nineteen lines reported receipts from other sources amounting to $207,785.40, making the gross receipts $10,458,589.10, an increase of $3,548,378 over 1904.

The number of passenger cars operated on all lines was 1,803, an increase of 451, while the number of freight cars was 102. The total amount of wages paid was $4,692,762.

John B. McDonald on Subway Plans.

On Tuesday of this week Comptroller Metz of New York City made public a letter from John B. McDonald, the contractor for the present subway, criticizing in detail the plans of the public service commission for additional subways and especially for the Fourth avenue subway, for which bids have just been received. Mr. McDonald estimates the cost of the Broadway-Lexington route, construction and equipment, at $127,000,000, and of the Fourth avenue route at $44,000,000. He also says that the lines if built will not earn enough to pay interest on the cost of construction, and suggests the following extensions to the present subway system:

"For the east side, extension should be made from Forty-second street via Lexington avenue, Southern boulevard, Westchester avenue to Pelham Bay park. This will give a through line from Pelham Bay park to the Battery, with increased facilities at the Grand Central station. For the west side, extension should be made from Broadway and Forty-fifth street south through Seventh avenue, Greenwich street, West Broadway to a terminal under Battery park. This would complete a west side line from the Bronx to Battery park. This extension is of the greatest importance to the business interests of the city, especially in connecton with the Pennsylvania terminal, which is approaching completion, and which is unequaled by anything of its kind in the world, and will handle more than 200,000 people a day, for whom transportaton facilities must be provided in the very near future.

"Another feature of this extension is that by the construction of a short line through Canal street, connecting with the Brooklyn-Manhattan loop, now being built by the city, a direct line to the new Pennsylvania station will be given to the people of Brooklyn."

Mr. McDonald also criticizes the Fourth avenue line as running through a sparsely settled territory. He suggests that it be made a 2-track line instead of four tracks and that a 2-track subway be built on Bedford and Lafayette avenues to the Williamsburg bridge.

Labor Troubles in Chicago.

A strike of the employes of the Chicago Railways Company has been threatened this week because of the refusal of the company to discharge 19 men who had resigned from the union and refused to pay their dues. The members of the union held a meeting on May 10 and decided by a vote of 4,303 to 59 to declare a strike if the delinquent members were not discharged. Eight of the latter have applied for an injunction restraining the company from discharging them and the union from conspiring to enforce their discharge.

The trouble which has led to the present crisis grows out of a long controversy between two factions of the union, the minority faction being composed of the 19 members who resigned in January because of dissatisfaction with the policy of the union. The men have been working for six years under a tacit "closed shop" agreement, which has heretofore been adhered to, and the company has always obliged members to pay their dues to the union. President J. M. Roach has offered to submit the present dispute to arbitration, but has declined to compel men to remain in the union against their wishes. Officers of the union refused the offer of arbitration and ordered a strike vote.

On Tuesday, May 12, eight of the formers members of the union applied to Judge Carpenter for an injunction, stating that they had resigned because of dissatisfaction with the manner in which the funds of the union had been expended and that the union, by threatening a strike, was seeking to force their discharge. They claimed that $1,200 had been expended in the last municipal campaign to defeat the traction ordinances against their wishes, and that although $190,000 had been paid in dues and assessments, only about $5,000 remained in the treasury. The court refused to issue the injunction on an ex parte hearing and upon application of attorneys for the union a hearing on the injunction was appointed for Friday morning.

W. D. Mahon, president of the Amalgamated Association of Street and Electric Railway Employes, arrived in Chicago on Wednesday and ordered the men not to take any action until after the injunction case is decided. On Wednesday trouble was threatened because a motorman refused to take out a car with a conductor who had been suspended from the union, but another conductor was substituted.

The employes of the Chicago Subway Company are on a strike for increased wages and the service has been interfered with to some extent. Several conflicts have occurred between pickets and strikebreakers. The company has refused to deal with the strikers and their places have been filled.

Bids Received for Brooklyn Subway.

The New York public service commission of the first district received bids on May 8 for the construction of the Brooklyn Fourth avenue subway, extending from the Brooklyn terminal of the Manhattan bridge to Forty-third street.

In order to provide an opportunity for the city to make at least a beginning on the building of the road the commission divided the route into six sections and advertised for bids for the construction of each separately. After the commission has decided upon its awards a report showing the bids accepted by the commission will be sent to the board of estimate. That body will not have the power to change the awards, but the building of the subway cannot be begun until the board of estimate has appropriated the money. Bids were received for construction alone. Some arrangement for the operation of the subway will be made at a later date.

Thirty-four bids were received in all, from 15 contracting firms. William Bradley, one of the subcontractors for the Manhattan subway, bid on all six sections. The lowest bidders for the six sections were: James P. Graham, William Bradley, William Bradley, E. E. Smith Contracting Company, James P. Graham and Remington & Sherman Company and F. W. Carlin Construction Company, which submitted a joint bid. The total of the lowest bids is $14,344,775 for the six sections. Westinghouse, Church, Kerr & Co. submitted a bid on the "master and servant" principle, proposing to build the subway on the basis of an agreed schedule of unit costs for materials and labor. The company also submitted a schedule of prices.

The plans call for the construction of a 4-track railroad, with pipe galleries, but the contractor will not be required to lay tracks, ties or ballast. The method of construction is to be excavation under cover, except at certain points specified.

There is considerable doubt as to whether the city can provide funds for undertaking the subway project this year. Comptroller Metz has stated that there is only $2,000,000 available under the debt limit and that although this amount is expected to be increased by about $40,000,000 by July 1, the city is already committed to many other needed improvements. The comptroller has received a letter from John B. McDonald saying that it will be impossible to secure bidders for the operation of the subway at a rental sufficient to pay interest on the cost of construction.

The public service commission appointed a hearing for May 15 on a proposal made by several civic associations of Staten Island, that the Fourth avenue subway be extended to Staten Island. The original plans as prepared by the old rapid transit commission provided for an extension to Ft. Hamilton, but according to the plans of the public service commission, on which bids have just been received the route ends at Forty-third street.

The public service commission has petitioned the appellate division of the supreme court asking for an order extending the time in which subways may be built in Manhattan

under the original position given to the old rapid transit commission for five years from October 15, 1908. The routes referred to are the Third avenue, Seventh and Eighth avenue, Lexington avenue, White Plains, Jerome avenue, Gerard avenue and the Thirty-fourth and Fourteenth street routes.

Street Railway Affairs in Cleveland.

The Municipal Traction Company, which has been operating the street railway lines of Cleveland since April 27, is meeting with all sorts of difficulties, and storms of protest have been aroused by its methods of operation.

On May 6 Judge Babcock granted the injunction applied for by the village of East Cleveland restraining the Municipal Traction Company from charging more than a 3-cent fare to the suburb, on the ground that the franchise specified that the fare should be the same as on the Euclid avenue line. The company retaliated by increasing the headway of the cars from 4 minutes to 10 minutes, and on May 7 the village council passed an ordinance requiring an 8-minute headway during the day and a 4-minute headway during rush hours. The fare on the other suburban lines was not reduced. The village of Lakewood has also protested against the service given by the company and has threatened to take steps to forfeit the franchise.

The new transfers were put into effect on Saturday, May 9. A charge of one cent was made for each transfer, and as two cents additional is charged for a ride to a point outside the city many of the suburban residents were obliged to pay six cents. After the transfer system was put in operation it was found that it was not complete and it was necessary to use old Cleveland Electric transfers in the emergency. President du Pont says that in 90 days free transfers will be issued. Mayor Johnson has announced that the average receipts of the company are $13,000 a day and that 7 per cent of the passengers purchased transfers on Saturday. The company has abandoned service on several short lines which were declared unprofitable and has changed the routing of cars in many cases.

At the city council meeting on Monday six resolutions were presented protesting against the changing of routes, the abandonment of service on some lines and the curtailment of transfer privileges. It was decided to hold a public meeting of the street railway committee on Wednesday to receive complaints in regard to the service. Mayor Johnson agreed to be present.

The company proposes to build a more direct line on Euclid avenue, and on May 11 men were employed to secure consents of property owners for a line from East Twenty-second to East Fortieth street.

Officials of the Municipal Traction Company and representatives of the car men's union, who have threatened a strike unless their demand for an increase of wages was granted, signed articles of arbitration on Tuesday of this week. E. S. Meyer was selected to represent the car men and S. H. Tolles was chosen to represent the company. The arbitrators are to settle all points of difference between the company and its employes, the chief of which is as to whether the agreement of the Cleveland Electric Railway to give an increase of two cents per hour in the event of a renewal of its franchises is binding on the Municipal Traction Company. Other points to be settled are the status of the agreement between the Municipal company and its old employes and the right of the union's international organization to revoke the charter of the old Forest City union. In case the two arbitrators fail to agree within three days after the testimony has been heard they may select a third or they may extend the time, and their decision is to be final.

Western Society of Engineers.—An extra meeting of the Western Society of Engineers will be held in the society's rooms in the Monadnock block, Chicago, on May 18. Dr. P. H. Dudley of the New York Central will present an illustrated paper on "Steel Rails for Present Service: Their Manufacture and Their Failures."

Conference on Operating Rules in Michigan.—The Michigan railroad commission has decided to call a meeting of officials of the interurban railroads of the state at Lansing some time within the next two weeks to discuss a uniform system of dispatching. The occasion for the conference lies in the dissatisfaction of the commissioners, who have been investigating the recent accident on the Detroit United Railway, with the verbal system of train orders used by that company, and in the desire to establish a system of written orders.

New York Subway Trains Delayed by Short-Circuit.—Traffic in the Brooklyn extension of the New York subway was seriously interfered with during the rush hours on May 7 by an accident to the signal system. Rain water leaking into the Wilow street wire shaft caused a short-circuit in the alternating-current system controlling the signals and at 5:15 p. m. every signal from the Brooklyn Bridge station to Atlantic avenue stopped working. All the signals were set at danger and the automatic trippers were set up so that all trains had to move slowly. The conductors were obliged to hold down each tripper until the trains had passed. From 5:20 to 7:42 the trains were kept running in this manner on both tracks, although irregularly, until the short-circuit was discovered and removed. The direct-current power in the third rail was at no time interfered with.

Agree on Track Elevation in Chicago.—President Knight of the Chicago & Oak Park Elevated Railroad, Chicago, has reached an agreement with the track elevation committee of the city council in regard to the proposed ordinance providing for the elevation of the company's tracks from Fifty-second avenue west to the city limits. The committee had been considering a mandatory ordinance. Mr. Knight said that his road was chartered under the railroad laws of Illinois, that the city had no power to compel it to elevate its tracks, and that it would not consider elevation under a mandatory ordinance. He agreed, however, to accept a contract ordinance under the condition that the city should grant a 14-year extension of the Market street franchise, so as to make that franchise expire at the same time as the company's other franchises. It was finally decided that the city track elevation superintendent should draft an ordinance to be submitted to the company.

Strike Situation in Chester.—City officials of Chester, Pa., appeared before the Pennsylvania railroad commission on May 5 to complain against the service given by the Chester Traction Company since the strike was declared several weeks ago. The city solicitor filed a formal statement saying that the company is not fulfilling its franchise requirements as to service and that in operating its cars with non-union men it is employing incompetent and inexperienced motormen and conductors. The subject was fully discussed at a hearing on the following day, but the commission reserved its decision until a further hearing could be held. Members of the commission said that it was questionable whether the power of the commission should be invoked to settle difficulties involved in a strike. On May 5 an attempt was made by strikers or sympathizers to blow up a car with dynamite. The explosive was placed on the track at Ninth street and Morton avenue in Chester. Several windows were broken and a portion of the car flooring was torn up. There were no passengers in the car and the motorman and conductor escaped injury.

Conference on Chicago Elevated Loop.—Representatives of the four elevated railroads of Chicago held a conference with the city council committee on local transportation on May 7 to discuss the report of Engineer George Weston on means for relieving the congestion of the Union loop. Mr. Weston's report, which was abstracted in the Electric Railway Review of May 2, page 539, recommended, among other changes, the through routing of the South Side Elevated and the Northwestern Elevated cars and the introduction of universal transfers between the four companies. The Northwestern Elevated Railroad and the Chicago & Oak Park Elevated were in favor of the changes mentioned, but the other two roads were unwilling to adopt them unless concessions were granted by the city. It was finally agreed to have the engineers of the four roads meet with Mr. Weston and discuss the subject. On Tuesday of this week a meeting was held in Mr. Weston's office, but with no definite result. It was decided to await a conference with a representative of Ford, Bacon & Davis, who made a report on the same subject for the Northwestern during the winter.

Wage Arbitration in Pittsburg.—The committee appointed to arbitrate the controversy between the Pittsburg Railways Company and its employes on the subject of the wage scale to be put into effect for the ensuing year held a hearing on May 8, at which representatives of the union and of the company submitted arguments. It was announced that no decision would probably be reached until next week. In the meantime the company has agreed to suspend its proposed reduction of one cent per hour, which was originally intended to go into effect on May 1, until a decision is reached. The finding of the committee is to be binding. Clarence Burleigh, attorney for the company, stated that owing to the prevailing business depression the company's receipts had been decreased to such an extent that it was necessary to rearrange the wage schedule on a lower basis. He presented figures showing that in only one year in the last 10 had the company earned a profit; that the yearly deficit amounted to from $25,000 to $100,000 a year, and since 1902 had aggregated $451,000. William D. Mahon, international president of the Amalgamated association, and W. J. Brennen, attorney for the local union, argued that the company's business was non-competitive, that its basic source of revenue, a 5-cent fare, remained the same, and that if fewer passengers were carried fewer cars were run.

Traffic and Transportation

Fare Increase is Disapproved.

The Massachusetts railroad commission has rendered a decision on a complaint regarding an increase in fares by the Connecticut Valley Street Railway of Greenfield, Mass. An abstract of the decision follows:

"The railway directors voted to make certain changes in fares, which would increase the number of fare collections on the Millers Falls division from two to three, effective on April 1, 1908, and at the same time petitioned the board to approve the withdrawal of a free transfer at Lake Pleasant, a junction point, on the ground that no further occasion will exist therefor. If the additional fare is found to be reasonable, and the withdrawal of the free transfer is approved, the fare from Montague village to Turners Falls, substantially seven miles, will be 15 cents, and the fare from Millers Falls to Turners Falls, a lake distance, will be the same sum.

"The railway serves a substantial area in the Connecticut valley and exclusively affords a main route of street railway transportation from a prosperous city through and into several thriving towns. While the company as a whole has not in its short existence as a consolidated system earned dividends satisfactory to its stockholders, it is yet true that the theory of consolidation is predicated upon the ability of the company through saving in operation to ultimately realize satisfactory financial returns, and eventually justify the expectations and prove the judgment of those persons who have put their money into the enterprise. Whatever the future may disclose relative to the earning ability of the company, the board at this time is unwilling, under all the circumstances of the case, to approve the selection of a single division of this recently consolidated system, and by a substantial advance increase the fare thereon to the rate now established by the directors. It may be that experience will demonstrate the failure of this company to realize an adequate return upon investment, but we prefer a demonstration by experience as a criterion upon which to base our official action.

"In view of the whole situation, giving due regard to the enterprise as a whole, its history, geographical location and financial condition, and applying the principles that should obtain in ascertaining the reasonableness of a passenger rate, the board is unable to adjudicate the fare a reasonable one. We are confirmed in this decision by our inability to find anything in the way of comparative rates for like service under like conditions upon this road or elsewhere in Massachusetts to justify the company in charging 15 cents for a ride over a part only of its system in the township, thus creating a 20-cent fare within the town limits. Upon these facts, therefore, there can be but one conclusion, and that is that the charge of which complaint is mare is unreasonable and excessive. We recommend a reduction. In view of this recommendation we must at the same time withhold our approval of the petition of the company for withdrawal of the free transfer at Lake Pleasant."

Express Service Planned.—Officials of the Lehigh Valley Transit Company, Allentown, Pa., have under consideration the establishment of express service between Philadelphia and Allentown.

Effect of 2-Cent Steam Railway Fares.—M. E. McCaskey, second vice-president of the Mahoning & Shenango Railway & Light Company, Youngstown, O., states that the adoption of 2-cents-per-mile fares by steam railways will not affect, in his opinion electric railway traffic. He believes that the decrease in steam railway fares to two cents per mile will not cause any reduction or increase in the fares on interurban electric roads.

Testimony in Atlanta (Ga.) Fare Case.—In the hearing before the Georgia railroad commission regarding the complaint concerning city and suburban fares of the Georgia Railway & Electric Company, Atlanta, Ga., an inventory and appraisement of the physical property and franchises constituting the assets of the company devoted to the railway service were presented. Figures were given of gross earnings, operating expenses and taxes, showing allowances for depreciation and contingencies. The company made an exhibit of the service furnished, showing the class of equipment, physical condition of the property and the reduction of average rate of fare by extension of lines and development of transfer priviliges, etc. The company also had a written statement from the leading citizens of the community testifying that the service was good, the fares reasonable to the public and the public generally satisfied, and suggesting that no reduction in fares be made.

Construction News

FRANCHISES.

Bellefontaine, O.—The Ohio Electric Railway Company has received from the city of Bellefontaine a 25-year renewal of its original franchise and an outlet for its Lima & Toledo line, which has been completed to within three miles of Bellefontaine. The city has dismissed the suits which it brought against the company and the company has paid $4,300 on a disputed paving assessment, donated ground to the city for a street and entered into an agreement to improve another street by widening it. These adjustments now settle the differences formerly existing between the city and the company and it is expected that the line will be in operation from Bellefontaine to Lima within six weeks, thus completing the Schoepf syndicate's "river-to-the-lake" line.

Kimmswick & Northern Railway, St. Louis, Mo.—This company has applied for a franchise to build a single or double track line through various streets and alleys in the southwestern part of St. Louis with a terminus at Ivory avenue and Broadway, and for the construction of a bridge across the River des Peres.

Monroe, Mich.—Attorney Willis Baldwin has notified the city council that the Toledo Ottawa Beach & Northern Railway Company will apply for a franchise to operate its interurban line through Monroe. It is stated that the line will be extended from Toledo Beach to Wyandotte, a suburb of Detroit. L. E. Beilstein, general manager, Toledo, O.

Redlands, Cal.—The franchises which have been granted to the Redlands and Yucaipe Electric Railroad Company during the past year have been extended as follows: Thirty days additional in which to expend the $5,000 required for the first year's work on the State street, Citrus avenue, Reservoir street and the Yucaipe road; the rails and ties for this line have been ordered and are expected within 30 days: six months' extension in which to build from the western to the eastern city limits on Colton avenue and on Sixth street to connect with the State street line of the road; 60 days additional in which to commence the construction of the electric line to Crafton. This franchise was originally granted to C. C. Haskell, a San Bernardino attorney, who has assigned it to the Redlands & Yucaipe company, which will use a portion of the route for its line, the remainder being used for the line to Crafton. R. H. Dunn and C. S. Chesnut are the holders of the franchises.

Spokane, Wash.—Jay P. Graves, president of the Spokane & Inland Empire Railroad, has applied to the city council for a franchise for the construction of a line in Mendenhall avenue, the continuation of East Riverside, from Madelia street and Olive avenue to Sprague avenue and Freya street, about two miles. This will give direct service to the Spokane interstate fair association grounds, four miles east of the heart of the business district.

Stockton, Cal.—The city council has granted a franchise to the Central California Traction Company for an extension of its line in Stockton.

Terre Haute, Ind.—The Grand Central Traction Company, Indianapolis, Ind., which has made application for a franchise to enter Terre Haute with its Bloomington-Terre Haute branch, has been required by the city council to deposit $15,000 as a guarantee that the work would be started and completed within a reasonable time. The contract also must contain a clause stating that the company will not sell out

RECENT INCORPORATIONS.

Alabama Railway & Electric Company.—Incorporated in Alabama to build an electric railway through the counties of Calhoun, Clay, Tallapoosa, Chambers, Lee, Russell, Barbour, Dale and Houston, connecting Opelika and Eufala, Ala., a total distance of 55 miles. Capital stock, $200,000. Judson C. Chapman, Atlanta, Ga., is vice-president and counsel. (Noted May 9.)

Columbus Canton & Eastern Transit Company.—Incorporated in Ohio to construct an electric railway through Canal Dover, Coshocton, New Philadelphia, Newcomerstown and Newark, O. Preliminary surveys have been made and construction will be started as soon as financial arrangements are completed. Headquarters, New Philadelphia, O. Capital stock, $200,000. Incorporators: W. J. Wise, W. W. Snyder, Clyde J. Knisely, Frank J. G. Kuenzli, F. O. Richards, A. W. Reiser and E. S. Rhodes.

Oklahoma City Belt Line Railroad.—Incorporated in Oklahoma with a capital stock of $250,000. W. W. Bierce, Oklahoma City, Okla., is one of the incorporators.

San Angelo Power & Traction Company, San Angelo, Tex.—Incorporated in Texas to build a street railway in San Angelo. Capital stock, $50,000. Incorporators: T. M. Vaughan, J. A. Williams, W. D. Fuller and others.

Twin Cities & Lake Superior Street Railway.—Incorporated in Wisconsin to build an electric railway from Minneapolis and St. Paul, Minn., to Superior, Wis., 130 miles. The company originally was incorporated under the laws of the state of Maine for the construction of this line under the name of the Twin City & Lake Superior Railway. The Wisconsin articles provide for a road from Sunrise to Peet and from Foxboro to Superior. Capital stock, $7,000,000. Incorporators: E. L. Peet, Gransburg, Wis.; G. B. Haugan, Duluth, Minn.; F. R. Duxberry, St. Paul, Minn.; E. Lewis, Storm Lake, Minn.; Edward Henry, Minneapolis. (Noted October 12, 1907.)

Wood River East Alton & Bunker Hill Traction Company.—Incorporated in Illinois to build an electric railway between Wood River, East Alton, Bethalto, Moro, Bunker Hill, Gillespie and Litchfield, Ill., about 60 miles. The overhead trolley system will be used and power for lighting and other purposes will be furnished to cities and towns along the route. It is planned to locate the power station and repair shops at Bethalto, Ill. Practically all the right of way and franchises through several towns have been secured. Capital stock, $250,000. Incorporators: J. T. W. Rudisill, president; R. A. Mavey, vice-president; S. B. Knepper, secretary; R. M. Smith, treasurer; all of East St. Louis, Ill.

TRACK AND ROADWAY.

Alabama Railway & Electric Company, Atlanta, Ga.—Judson C. Chapman, vice-president and counsel, writes that this company proposes to build an electric railway from Lafayette to Eufaula, Ala., 80 miles, which will ultimately be extended to the coast of the gulf of Mexico. Surveys have been completed and grading has been completed from Lafayette to Opelika. A contract is to be let for grading between Opelika and Eufaula within 30 days. Grades and curves will be light, but several short bridges and trestles will be required. It is the purpose of the company to have at least 15 miles in operation this year. A. M. Buchanan of Opelika is president.

Ashtabula (O.) Electric Street Railway.—This company intends to construct its proposed road from Ashtabula to Ashtabula Harbor, 5½ miles, this year. The company proposes to use the overhead trolley system and to operate five cars. No contracts have been awarded. Officers: C. E. Wallin, president; E. P. Broden, vice-president; J. V. Paulson, secretary; O. Arvidson, treasurer; and C. F. Brotherton, general manager.

Berkeley, Cal.—Capitalists of this city are considering the advisability of organizing a company to build an electric car line through Cragmont up the Berkeley hills to the top of Grizzly peak, on a 6 per cent grade.

Canadian Valley Railway, Mutual, Okla.—This company, which proposes to build an electric railway from Mutual to Oklahoma City, Okla., 150 miles, is reported to have elected Thomas H. Martin, president, and E. O. McCance, secretary. (Noted April 18.)

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—Tracklaying has been started on the line in the city of Milwaukee from the Sixth street viaduct to the terminal at Wells and Second streets. The Columbia Construction Company of Milwaukee has the contract for the city portion of the work remaining to be completed. (Noted May 2.)

Cincinnati, O.—J. G. Schmidlapp, who is interested in a project to build an elevated railroad in Cincinnati, has announced that the line will be extended to Hamilton, O., a distance of 23 miles, via Norwood.

Citizens' Light & Transit Company, Pine Bluff, Ark.—This company is engaged in building a double track on West Sixth avenue from Main street to Cherry street, a distance of 10 blocks, replacing T-rails with 73-pound girder rails with a concrete foundation. F. E. Cherot, general manager.

Cleveland Brooklyn & Elyria Railway, Cleveland, O.—At the annual meeting last week the following officers were elected: President, J. J. Breitinger, Cleveland; vice-president, W. E. Brooks, Elyria; secretary, Harry Knisely, Jr., Cleveland; and treasurer, B. E. Oppman, Cleveland. The company proposes to build an electric railway from Cleveland to Elyria, Orrville and Zanesville. It is stated that construction will be started in about 60 days. (Noted April 4.)

Hanover & McSherrystown Street Railway, Hanover, Pa.—This company, which recently began construction work on its proposed line from McSherrystown, 5½ miles, has increased its capital stock from $30,000 to $200,000. R. B. McKinnon of York, Pa., is chief engineer. (Noted April 18.)

Illinois Central Electric Railway, Canton, Ill.—The electrified line from Canton to St. David, Ill., which has been operated heretofore with gasoline motor cars, was opened for traffic on May 10. The present line is six miles long. Several extensions are planned. (Noted April 25.)

Juniata Valley Electric Street Railway, Huntingdon, Pa.—This company has filed a notice of its intention to extend its line over various streets in Huntingdon. R. W. Jacobs, president.

Kansas City Springfield & Southern Railway.—C. C. McFann, general manager, writes that the report that grading had been started on the proposed line from Nevada to Springfield, Mo., is erroneous, and that probably no work will be done on the line this summer. (Noted May 2.)

Kentucky & Ohio River Interurban Railway, Paducah, Ky.—This company has awarded a contract to the Western Engineering & Construction Company of Minneapolis, Minn., for the construction of the proposed line from Paducah, Ky., to Cairo, Ill., 40 miles. John J. Freundlich is general manager. (Noted April 18.)

Mankato (Minn.) Electric Traction Company.—This company, which recently completed a 3-mile electric line in Mankato, Minn., has filed a trust deed for $400,000 in favor of the Northwestern Trust Company of St. Paul to secure a bond issue to pay for the construction and equipment of the present line and for extensions. (Noted May 2.)

Milner & North Side Railroad, Milner, Idaho.—D. C. MacWatters, president, writes that grading is in progress from Gooding to Jerome, 26 miles, on the proposed line from Gooding to Milner, Idaho, 65 miles, via Hillsdale, Jerome and Wendell. Donald Grant & Co. have the contract for grading and tracklaying. Maximum grade, 1 per cent; maximum curvature, 6.8 degree. R. S. A. Bickel, chief engineer, and Fentress Hill, secretary. (Noted April 11.)

Milwaukee (Wis.) Light Heat & Traction Company.—Construction work on the extension from Oconomowoc to Watertown, Wis., is being rushed with the intention of opening the line by July 1. (Noted February 22.)

Niagara St. Catharines & Toronto Railway, St. Catharines, Ont.—The 5-mile extension from Fontbill to Welland, Ont., was opened for traffic on May 4.

Northwestern Interurban Railway, Fargo, N. D.—A. T. Russell, secretary, writes that this company proposes to build an electric railway from Fargo to Fargo Junction, Minn., about 40 miles, and to use the tracks of the Minneapolis St. Paul & Sault Ste. Marie Railway from Fargo Junction to Detroit, 3½ miles. Surveys have been completed and a contract has been let to White & McCoy for grading from Lake Center to Fargo Junction, nine miles. This section is expected to be in operation by August of this year and the remainder of the road is to be built next year. The first section will be operated by steam at first, but it is the intention to erect a power house later at Rollag, located near the center of the line. The officers are: President, C. N. Callander of Fargo; treasurer, E. H. Probstfield; secretary, A. T. Russell; chief engineer, D. L. Buckingham, Cormorant, Minn.

Ohio Electric Railway, Cincinnati, O.—W. Kesley Schoepf, president, is quoted as saying that the Lima-Bellefontaine line, 34 miles long, will be opened for traffic about June 15. (Noted April 18.)

Ontario West Shore Electric Railway, Goderich, Ont.—This company is making surveys for its proposed line between Goderich and Kincardine, Ont. V. M. Roberts, chief engineer. (Noted February 1.)

Oregon Interurban Railway, Oregon, Mo.—It is reported that surveys have been made for a line from Oregon to Forest City, Mo., five miles, but that the company is not yet ready to let contracts. Benjamin F. Morgan is president and George Custer of Marysville, Mo., is chief engineer.

Portland, Ore.—It is reported that a company has been organized to build an electric railway from Condon to Bend, Ore. H. I. Keeny, George C. Mason, Mark W. Gill and others of Portland and Seattle are interested.

St. Louis, Mo.—W. C. Dines of the Citizens' Investment Company, 510 Pine street, St. Louis, desires to secure the assistance of one or two railroad contractors in connection with the construction of an electric railroad in this vicinity.

Salt Lake & Ogden Railway, Salt Lake City, Utah.—Details in regard to the crossing of the Union Pacific tracks near Salt Lake City have been settled and work is being pushed on the line between Salt Lake City and Ogden with the intention of opening the line by June 1. Simon Bamberger, president. (Noted May 2.)

Seattle Snohomish & Everett Railway, Seattle, Wash.—C. M. Kimball writes that this company proposes to build an electric railway from Seattle to Everett, Wash., 30 miles, via Bothell and Snohomish. Right of way is now being secured for the section from Seattle to Everett and contracts are to be let soon. It has not yet been decided whether to build an independent line into the city of Seattle or to connect with the Seattle Electric Company's line. (Noted May 9.)

Seattle (Wash.) Electric Company.—Jacob Furth, president, recently stated to a committee representing the West Woodland Improvement Club which petitioned for an extension of the Fremont-Ballard line from Forty-fifth street to Sixty-fifth street that the company proposes to construct the line as soon as financial conditions permit.

Snohomish Valley Railroad, Snohomish, Wash.—It is reported that financial arrangements have been made for beginning construction immediately on the first 15 miles of the proposed line from Snohomish to Seattle and Tacoma, Wash. Edward Wright, president. (Noted September 7, 1907.)

Sparta-Melrose Electric Railway & Power Company, Sparta, Wis.—This company, which proposes to build an electric railway from Sparta to Melrose, Wis., 28 miles, has elected new officers as follows: President, Charles Newland; vice-president, James Cole; secretary, Howard Teasdale; treasurer, W. A. Sholes. The proposed route has been changed so as to make a more direct line by leaving out Trout Falls. Construction has been started. (Noted March 30, 1907.)

Swallow Falls Electric Light & Power Company.—It is reported that this company proposes to build an electric railway from Swallow Falls to Oakland, Md., about eight miles. H. P. Tasker of Oakland, Md., is interested.

Taylorville (Ill.) Electric Railway.—It is reported that sufficient stock has been subscribed by residents of Taylorville to insure the construction of the proposed street railway this summer. W. B. Adams is interested. (Noted May 2.)

Toledo Ottawa Beach & Northern Railway, Toledo, O.—It is reported that this line will be extended next year from Toledo Beach along the shore of Lake Erie to Wyandotte, a suburb of Detroit. The preliminary work of securing right of way and franchises is to be undertaken this year. L. E. Bellstein, general manager.

Toronto & York Radial Railway, Toronto, Ont.—This company expects to build an extension from Jackson's Point to Sutton, Ont., 1½ miles. James McDougall, chief engineer.

Toronto (Ont.) Suburban Railway.—Surveys are being made for an extension from Fairview avenue to Swansea, Ont. G. C. Royse of Toronto Junction is general manager.

Troy Rensselaer & Pittsfield Street Railway, Pittsfield, Mass.—A large force is now engaged in the construction of a line from Troy, N. Y., to Pittsfield, Mass. It is expected that the line will be in operation from Lebanon mountain to Pittsfield by August 1.

Westchester & Wilmington Electric Railway, Westchester, Pa.—This company, which recently awarded a contract to the Eastern Railway Construction Company for the construction of the line from Westchester, Pa., to Wilmington, Del., 16½ miles, has increased its capital stock from $254,000 to $500,000. Thomas E. O'Connell, president. (Noted May 9.)

West Penn Railways, Connellsville, Pa.—This company is building an extension from New Salem Junction to Brownsville, Pa., which is to be opened by July 1. L. H. Conklin, general superintendent.

Wood River East Alton & Bunker Hill Traction Company.—It is stated that W. H. Morgan of Edwardsville, Ill., will soon begin surveying the proposed line from Wood River in Madison county, Illinois, to Gillespie, in Montgomery county, Illinois.

Yakima Intervalley Electric Railroad, North Yakima, Wash.—T. A. Noble, engineer, has presented plans of the proposed line from North Yakima to Granger, Wash., to the county commissioners, who will appoint a hearing on the company's application for a franchise. The route includes Parker, Zillah and Sunnyside and as surveyed is about 38 miles long. (Noted February 15.)

POWER HOUSES AND SUBSTATIONS.

Birmingham (Ala.) Railway Light & Power Company.—A new rotary converter substation for transforming current for the regulation of the lighting system at Ensley and Wylam, Ala., has recently been completed at Ensley.

Interurban Railway & Terminal Company, Cincinnati, O.—This company recently placed orders for the construction and equipment of a new substation to include two 250-kilowatt Allis-Chalmers rotary converters with transformers and switchboard complete.

Portland Railway Light & Power Company, Portland, Ore.—This company has installed an electric lighting system at Gresham, Ore., the power for which is furnished from the Cazadero plant of the company on the Clackamas river, about 25 miles south of Gresham.

Cedar Rapids & Iowa Railway & Light Company, Cedar Rapids, Ia.—It is reported that this company will increase the capacity of its power station by the installation of a 750-kilowatt motor-generator set for railway purposes. W. G. Dows, president and general manager, Cedar Rapids.

Stroudsburg & Water Gap Street Railway, Stroudsburg, Pa.—This company is planning to increase the capacity of its power house by the installation of a 250-horsepower slow-speed engine and a 100-horsepower boiler. H. E. Sweeney, vice-president and purchasing agent, Stroudsburg, Pa.

Idaho Washington & Oregon Traction Company.—Frank McKean, an engineer representing this company, which proposes to build an electric railway from Lewiston, Idaho, to Pomeroy and other points in Washington, has filed notice for a 12,000-horsepower water right along the line under the name of the North Coast Power Company. Work already has been started on the construction of a dam across the Clearwater river, about four miles north of Lewiston. (Noted May 2.)

Northern Electric Company, Madison, Wis.—At a recent meeting at Pueblo, Colo., A. B. Hulit, representing this company, submitted a proposition for the construction of a large power plant at Canyon City coal fields and an interurban electric line from Canyon City, Colo., by way of Pueblo to Dodge City, Kan., with a branch line from Garden City to Scott City, Kan. The company also proposes to establish pumping plants along the Arkansas river.

York Haven (Pa.) Water Power Company.—Work has been started by this company on a power house extension which will accommodate new generating units of 10,000 horsepower. It is stated that 10 generators, each to be driven by a pair of water wheels, have been ordered from the General Electric Company. It is expected that by the time of completing the additional installation it will be possible to extend the high-tension transmission system to Lancaster and other cities.

Menominee & Marinette Light & Traction Company, Menominee, Mich.—Announcement is made that this company has decided to purchase the controlling interest in the Grand Rapids water power, two miles east of Ingalls, Mich., and will begin some time in June the construction of a large power house and dam, which will furnish light and power for the operation of its lines in Menominee and Marinette. The minimum capacity will be about 4,500 horsepower. The company recently has increased its capital stock to $1,000,000, of which amount $440,000 will be offered for sale to the residents of the two cities. Edward Daniell, general manager, Menominee, Mich.

A party of officials of the Texas Traction Company of Dallas, Tex., together with a large number of city officials and business men of Dallas, made an inspection trip over the new Dallas-Sherman line between Dallas and McKinney on April 23 in a train hauled by a steam locomotive.

Fifty members of the syndicate that financed the construction of the Washington Baltimore & Annapolis Electric Railway, Baltimore, Md., made a trip of inspection over the line on Tuesday of this week in a special train, accompanied by George T. Bishop, president, and J. N. Shannahan, general manager. The party included a large number of Cleveland capitalists.

Since the opening of the Brooklyn extension of the New York subway it is possible to ride from New Rochelle to the Flatbush avenue terminal of the Long Island Railroad, a distance of 23 miles, for eight cents, five cents on the surface line and three cents for a transfer to the Third avenue elevated road, from which a free transfer to the subway is given at One Hundred and Forty-ninth street.

Personal Mention

Mr. C. F. Burns has resigned as a director of the United Traction Company and the Hudson Valley Railway Company, controlled by the Delaware & Hudson Company.

Mr. J. B. Rumsey, heretofore general manager of the Buffalo Southern Railway, Buffalo, N. Y., has resigned. He will be succeeded by Mr. J. A. Bangert of New York City.

Mr. B. E. Tilton has resigned as engineer of maintenance of way of the Cleveland Electric Railway, which is now operated under a lease by the Municipal Traction Company.

Mr. B. W. Mendenhall has been appointed commercial agent for the Utah Light & Railway Company of Salt Lake City, Utah, effective at once. Mr. Mendenhall formerly was manager of the Ely Light & Power Company at Ely, Nev.

Mr. G. S. Shinnick, chief clerk of the Ohio Electric Railway Company at Newark, O., has been transferred to Columbus, O., as chief assistant to Mr. W. A. Gibbs, manager of the Dayton and Zanesville lines of the company. Mr. Shinnick formerly was auditor of the Columbus Buckeye Lake & Newark Traction Company at Columbus.

Mr. Ivan Ofverholm, chief engineer of the electrification department of the Swedish government railways, is on a visit of inspection to this country in connection with the electrification of railways in the southern part of Sweden. He will visit a number of the most important heavy electric traction and single-phase roads while here, for the purpose of collecting data on this subject, which, on account of the high price and increasing scarcity of coal in his country, is occupying the attention of the railway engineers. He will return to Sweden the latter part of May.

Mr. H. H. Adams, heretofore superintendent of shops of the United Railways & Electric Company of Baltimore, Md., has been appointed to the position of superintendent of rolling stock and shops of the New York City Railway, with headquarters at 775 Seventh avenue, New York, effective on May 11. The superintendent of equipment and the master mechanic will report to the superintendent of rolling stock and shops, who will report to the general manager for the receivers, Mr. Oren Root. Mr. Adams is a graduate of Stevens Polytechnic Institute of the class of 1893. After graduation he became connected with the Consolidated Traction Company of New Jersey and for about six years was connected with the North Jersey Street Railway of Newark, N. J. On January 1, 1902, he resigned as master mechanic of the North Jersey system to become superintendent of shops of the United Railways & Electric Company at Baltimore, which position he has held until his present appointment. Mr. Adams is well known to readers of the Electric Railway Review through his connection with the American Street and Interurban Railway Engineering Association, of which he was president for two years, from 1905 to 1907, and of which he is now a member of the "Standardization" committee. Mr. Adams is an associate member of the American Institute of Electrical Engineers, a member of the New York Railroad Club and an associate member of the American Street and Interurban Railway Association.

H. H. Adams.

Mr. Harry B. Ivers, for the past year treasurer and assistant to the president of the Bangor Railway & Electric Company at Bangor, Me., has been appointed general manager of the Lewiston Augusta & Waterville Street Railway, Lewiston, Me., the latter road being a consolidation of all the electric lines in the middle and western part of Maine. Mr. Ivers will retain his position as assistant to the president, John R. Graham, who also is president of the consolidated company. He will be succeeded as treasurer of the Bangor Railway & Electric Company by Mr. James W. Cartwright, Jr., formerly purchasing agent of the company. Mr. Walter L. Sawtelle, who has had in charge the soliciting of new business, will in addition take over the duties of purchasing agent, succeeding Mr. Cartwright.

Mr. Henry A. Haigh, who has been elected president of the Cincinnati Georgetown & Portsmouth Railroad, Cincinnati, O., to succeed the late A. W. Comstock, was born in Dearborn, Mich., in 1854. He was educated in the public schools and in 1874 and 1878, respectively, received degrees from the Michigan Agricultural College and from Michigan University. He was admitted to the bar in 1878 and practiced law in Detroit for a number of years. In 1899 he became interested in various industrial and transportation enterprises, being one of the organizers and builders of the Toledo Fremont & Norwalk Railroad, now a part of the Lake Shore Electric Railway system. He also built the Rochester & Eastern Rapid Railway of Rochester, N. Y. He was formerly vice-president of the Detroit Ypsilanti Ann Arbor & Jackson Railway (now the Detroit Jackson & Chicago), owned by the Detroit United system, and is treasurer and one of the builders and owners of the Milwaukee Northern Railway, Sheboygan, Wis., which will comprise a total of 121 miles when completed. Thirty miles of this road are now in operation, with an extension under construction from Port Washington to Sheboygan. Mr. Haigh also is president and treasurer of the Comstock-Haigh-Walker Company, railway engineers and constructors, and is connected with various organizations, including banks, newspapers, etc. His election as president of the Cincinnati Georgetown & Portsmouth Railroad also includes the presidency of the Felicity & Bethel Railroad, which is a branch of the former road, although having an independent organization.

Henry A. Haigh.

Mr. Thomas F. Mullaney, who for the past 20 years has been connected with the engineering department of the General Electric Company, has resigned to become chief engineer of the Third Avenue Railroad of New York City. On the evening of May 6 a few friends and business associates of Mr. Mullaney gave a dinner at the Engineers' Club in New York, at which Mr. Mullaney was the guest of honor. The guests included a large number of prominent officials of the General Electric Company and of the New York electric roads. In the course of a speech as toastmaster, Mr. William J. Clark of the General Electric Company, presented Mr. Mullaney with a handsome watch, chain and charm, a gift from his old associates in the General Electric Company as a token of esteem and recognition of past efficient service. Mr. Mullaney has had in charge the installation of electrical machinery for some of the largest plants in the country for the Thomson-Houston Company and the General Electric Company and in earlier years was identified with the construction and operation of the underground conduit system during the period of that important phase of electrical and railway development. For several years past Mr. Mullaney's work has been confined to New York City, where he has had charge of many large installations of electrical machinery for the General Electric Company.

OBITUARY.

Joseph Brower, who was identified in an official capacity with the Fifth and Sixth Street railway lines in Philadelphia during the early days of their construction and operation, died recently in Mississippi City, Miss., aged 82 years.

Hosmer Buckingham Parsons, formerly president of the Wells, Fargo & Co.'s bank, New York City, a director of the Knickerbocker Trust Company of New York, a director of the Augusta-Aiken Electric Railway and the North Augusta Electric Improvement Company, Augusta, Ga., and interested in other large financial corporations, is dead.

Financial News

Anderson (S. C.) Traction Company.—Judge Pritchard of the United States circuit court at Asheville, N. C., has turned over to Robert E. Ligon, Edwin W. Robertson and Frank R. Frost, as receivers, the property of the Anderson Traction Company. This action was taken on complaint of the International Trust Company of Baltimore, Md., and supersedes the previous action whereby the property was placed in the hands of Mr. Robertson and Mr. Ligon as receivers on application of the Anderson Machine & Foundry Company.

Berkshire (Mass.) Street Railway.—Application has been made to the Massachusetts railroad commission for approval of an increase in the capital stock from $1,648,100 to $1,935,100. The proceeds will provide for floating debt and additions to property.

Chicago Railways Company.—The Merchants' Loan & Trust Company and the Union Trust Company of Chicago have purchased $1,200,000 of 5-year 6 per cent collateral trust notes dated February 1, 1908, and secured by deposit of $1,666,000 series A bonds.

Chicago Union Traction Company.—The cost of the receivership, excluding the reorganization expenses and the fees of attorneys employed in connection therewith, was, as shown by reports of the receivers filed in the United States circuit court at Chicago, as follows: Trust companies and special attorneys of trust companies (including $79,326.58 allowed certain New York financial interests in November, 1904), $312,826.58; receivers' services (remuneration by decree of court, exclusive of special remuneration allowed by directors and stockholders), $295,770.48; assessment of stockholders for legal services and expenditures in the protection of their rights, $905,078; remuneration allowed by court for special legal services in connection with the receivership, $365,924.41; total, $1,879,599.47.

Concord Maynard & Hudson Street Railway, Maynard, Mass.—Application has been made to the Massachusetts railroad commission for approval of an issue of $25,000 of 20-year 5 per cent bonds. The issue of these bonds would make a total of $200,000 bonds outstanding.

Danbury & Bethel Street Railway, Danbury, Conn.—An issue of $75,000 of 6 per cent debenture bonds, dated March 1, 1908, and due March 1, 1918, has been made. The bonds are redeemable at 105 after due notice on any interest date. The proceeds will provide for additions to the power house, for other permanent improvements and for retirement of the floating debt. The bonds are offered at par and interest by Clarence E. Thompson & Sons of New Haven and Bridgeport, Conn. No additional mortgage may be placed on the property without provision for these debentures.

Fulton Ferry Railway, New York.—Notice has been given by the Guaranty Trust Company of New York as trustee under the deed securing the first mortgage bonds dated November 1, 1895, that the receivers for the Metropolitan Street Railway, who are operating the ferry property under a trackage agreement, have announced that they are about to disaffirm the contract and give up the operation of the road. Bondholders are, therefore, requested to send information to the trust company regarding their holdings.

Interborough-Metropolitan Company, New York, N. Y.—The application of Attorney-General Jackson to bring suit in the name of New York state to forfeit the charter of the company has been denied by the appellate division of the supreme court, first department.

Maryland Electric Railways Company, Baltimore, Md.—The Fidelity Trust Company of Baltimore has purchased the remaining $250,000 of the $1,000,000 of first mortgage 5 per cent bonds of the Baltimore & Annapolis Short Line. The proceeds will be used in constructing a terminal station at Annapolis and for other purposes.

New York New Haven & Hartford Railroad.—The Massachusetts supreme court has rendered a decision that the New York New Haven & Hartford Railroad has transgressed the law in securing control of five street railways in Massachusetts. Acquisition of control of the Springfield Street Railway was held not to be in violation of the law. Attorney-General Malone of Massachusetts maintained that the New Haven road, either directly or indirectly, and contrary to law, owns and controls the Worcester & Webster Street Railway, the Webster & Dudley Street Railway, the Springfield Street Railway, the Berkshire Street Railway, the Worcester & Southbridge Street Railway and the Blackstone Valley Street Railway. The court says that the New Haven road, through the purchase and ownership of the street railway corporations named, by its creature, the Consolidated Railway Company, transgressed the law as to all the street railway companies mentioned in the information except the Springfield Street Railway, and that it is still transgressing in the same way as to the Worcester & Webster and the Webster & Dudley companies.

Philadelphia Company, Pittsburg, Pa.—W. B. Carson, the secretary, and Russell H. Beggs of Pittsburg and Sidney H. March of New York have been elected directors.—The combined income account for the year ended March 31, 1908, of the Philadelphia Company and affiliated operating companies, not including the Allegheny Heating Company, is as follows: Gross earnings, $18,767,441.46; operating expenses and taxes, $9,698,315.48; net earnings, $9,069,125.98; other income, $226,554.15; total income, $9,295,680.13; deductions from income, $1,325,271.64; net income before deducting fixed charges, improvements, betterments, extensions, etc., $7,970,408.49; fixed charges (interest on funded debt), $3,311,625.72; net income, $4,658,782.77; improvements, betterments, extensions and extraordinary maintenance expenses, $1,697,328.16; notes issued April 1, 1905, for extension of pipe lines, retired during the year, $375,000; car trust notes issued December 1, 1905, retired during the year, $40,000; total, $2,112,328.16; surplus, $2,546,454.61; dividends on preferred stocks, $383,201; surplus, $2,163,253.61.

Manufactures and Supplies

ROLLING STOCK.

Bloomington Pontiac & Joliet Electric Railway, Pontiac, Ill., is in the market for three cars.

Sheffield Company, Sheffield, Ala., is in the market for one double-truck interurban passenger and baggage car.

Jersey Central Traction Company, Keyport, N. J., has contracted with The J. G. Brill Company for four open double-truck cars.

Municipal Traction Company, Cleveland, O., has ordered 100 more of its cars rebuilt so that the pay-as-you-enter system of fare collection may be used on them.

Oneonta & Mohawk Valley Railroad, Oneonta, N. Y., has ordered five interurban double-truck cars from the Cincinnati Car Company. The trucks will be built by the American Locomotive Company.

Philadelphia Rapid Transit Company, Philadelphia, Pa., is having The J. G. Brill Company convert 49 of its standard type cars so that the pay-as-you-enter system of fare collection may be used on them.

Washington Railway & Electric Company, Washington, D. C., was reported in our issue of May 2 as about to close contracts for 15 large double-truck cars. We understand that contracts have been placed with The J. G. Brill Company for both cars and trucks.

Interurban Railway & Terminal Company, Cincinnati, O., has placed an order with the Allis-Chalmers Company for one quadruple 75-horsepower car equipment and two Christensen air brake equipments. The same company has also ordered two quadruple 50-horsepower car equipments from the Westinghouse Electric & Manufacturing Company.

TRADE NOTES.

Humphrey Trolley & Manufacturing Company, Detroit, Mich., has opened offices at 725 Chamber of Commerce building.

Texas Portland Cement Company, Dallas, Tex., announces that it has purchased the holdings and good will of the Iola Portland Cement Company of Texas.

Swetland Publishing Company, New York, publisher of the American Architect and Municipal Journal and Engineer, announces the removal of its Chicago office to 1664 Monadnock block.

General Electric Company, Schenectady, N. Y., at the annual meeting held on May 12, re-elected the old directors for the ensuing year and elected B. E. Sunny, vice-president, of Chicago, a director to succeed Frederick P. Fish, resigned.

Walter D. Snow, publicity engineer, has recently increased his facilities by removal to larger quarters at 170 Summer street, Boston, Mass., and the establishment of an addressing and mailing department, in connection with which select mailing lists will be maintained for the special use of his clients.

B. E. Sunny, whose resignation as vice-president and western manager of the General Electric Company and election to a vice-presidency of the American Telephone & Telegraph Company was reported in the Electric Railway Review for April 5, has been elected president of the Chicago Telephone Company.

National Brake Company, Buffalo, N. Y., reports among recent large orders for Peacock brakes a contract with the Chicago Railways for 600, to be installed on the new cars building and to be built, and also an order from the New York City Railway for 250 brakes, to be installed on the cars now being built by The J. G. Brill Company.

Northwestern Expanded Metal Company, Old Colony building, Chicago, announces changes in its personnel and staff resulting as follows: Henry S. Ames, president; Oscar Bradford, vice-president; William Hall, treasurer; W. G. Bartlett, secretary; Howard W. Foote, general manager; Ernest McCullough, chief engineer; G. F. Dodge, assistant chief engineer; C. S. Mooney, engineer and superintendent, Chicago factory; F. M. Whetstone, superintendent, Canton, O., factory.

George E. Pratt, formerly general sales manager of the Hicks Locomotive & Car Works, Chicago, has become vice-president and general manager of the Central Inspection Bureau, 17 State street, New York, and president of H. A. Clark & Co., dealers in passenger and freight cars and car specialties and sales agents for the Middletown Car Works, Middletown, Pa. Mr. Pratt has had a wide experience in the railway supply business and is well and favorably known among railway men.

American Blower Company, Detroit, Mich., has purchased the foundry formerly operated by the Northwestern Foundry & Supply Company of Detroit, manufacturer of cast-iron soil pipe and fittings and plumbers' specialties and expects to operate it for the manufacture of blower, exhaust fan, engine and heater castings. The company desires to dispose immediately of all of the soil pipe and fitting patterns and foundry equipment complete, and also a large stock of finished pipe fittings, bell traps, etc.

Westinghouse Machine Company, just at the close of 1907, received one of the largest orders ever placed for mechanical stoking equipment, aggregating 14,400 boiler horsepower. This was for one of the large Brooklyn power stations operated by the Transit Development Company, New York. The order comprised 24 stokers suited to 600-horsepower boilers of the B. & W. water tube type. Moreover, this is the second large order placed by this company for Roney stokers, and may be regarded as the direct result of a year's successful operation of the original 7,200-horsepower installation at the Kent avenue station. As this station was originally equipped with flat grates for hand firing the merits of mechanical stoking have unquestionably been demonstrated along the lines of high economy and low operating cost.

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

Munn & Co., 361 Broadway, New York, N. Y.—The 1908 edition of the Scientific American Index of Manufacturers has been issued.

Illinois Malleable Iron Company, Chicago.—An 8-page pamphlet describes the different types of brakeshoes for steam and electric railways manufactured by this company.

George W. Jackson, Inc., Chicago, Ill.—A handsome publication of value to all interested in the transportation of all kinds of material underground and overhead has been issued by the disposal station department of this company. Maps and diagrams show important work done by the company in and about Chicago and a number of interesting halftone views are included.

DIRECTORY OF ELECTRIC RAILWAY ASSOCIATIONS.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, 29 West Thirty-ninth street, New York.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim adjuster Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Engineering Association. Secretary, J. W. Corning, electrical engineer Boston Elevated Railway, Boston, Mass.

American Street and Interurban Railway Manufacturers' Association. Secretary, George Keegan, 2321 Park Row building, New York, N. Y.

American Street and Interurban Railway Transportation and Traffic Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York.

California Electric Railway Association. Secretary, L. E. W. Pioda, Oak and Broderick streets, San Francisco, Cal.

Canadian Street Railway Association. Secretary, Acton Burrows, 157 Bay street, Toronto, Ont.

Central Electric Railway Association. Secretary, A. L. Neereamer, Indianapolis, Ind. Next meeting, Toledo, O., May 26.

Central Electric Traffic Association. Chairman, A. L. Neereamer, Indianapolis, Ind. Next meeting, Toledo, O., May 25.

Colorado Electric Light Power and Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Electric Railway Shop Foremen's Association. Secretary, W. D. Bower, Public Service Corporation of New Jersey, Elizabeth, N. J.

Fox River Valley Railway & Lighting Association. Secretary, A. K. Ellis, general superintendent Wisconsin Light Heat & Power Company, Appleton, Wis.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Michigan Electric Association. Secretary, A. C. Marshall, Port Huron, Mich. Annual meeting, Grand Rapids, Mich., August 18 to 21.

National Amusement Park Association. Secretary, C. H. Oberheide, Trenton, N. J. Annual meetings third Tuesday of each November.

New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month, Boston, Mass.

Northwestern Electrical Association. Secretary, Roger N. Kimball, Kenosha, Wis.

Oklahoma Electric Light Railway and Gas Association. Secretary, Galen Crow, Guthrie, Okla. Annual convention, May 25, 26 and 27, Guthrie, Okla.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

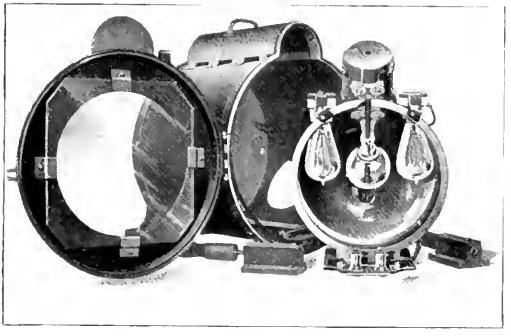
Southwestern Electrical and Gas Association. Secretary, J. A. Myler, Jr., Dallas, Tex.

Street Railway Association of the State of New York. Secretary, J. H. Pardee, 611 West One Hundred and Thirty-seventh street, New York, N. Y. Annual meeting, June 30 and July 1, Niagara Falls, Ont.

NEW ARC HEADLIGHT AND TROLLEY RETRIEVER.

The most recent products of the Trolley Supply Company, Canton, O., are a new headlight and a new retriever. Both of these devices are the result of long manufacturing experience along similar lines.

The new arc headlight known as the "Star" is built either with or without incandescent lamps. An accompanying halftone engraving shows in detail the more important parts of the headlight and clearly illustrates the method of



The "Star" Arc and Incandescent Headlight with Lamp Removed from Case.

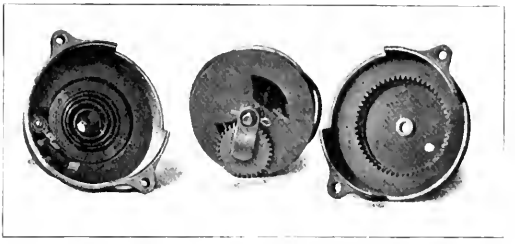
using square instead of round glass in the front door of the lamp. It has been the aim of the manufacturer to build a headlight which would be a lasting piece of machinery and not deteriorate rapidly from the severe service occasioned on high-speed interurban roads. In the design of the new Star headlight valuable suggestions made by street railway men have been incorporated.

One of the chief criticisms of headlights has been that of excessive repairs partly occasioned by weakness in the frame and case. For this reason the door, frame and backplate of the new headlight are made of malleable iron. The bottom plate and lower carbon holder and rings that hold the reflector and the incandescent attachment are also made of malleable iron, so that the lamp is a strong unit.

For operating the positive carbon an especially powerful magnet inclosed in a malleable iron holder, has been provided. This holder is lined with asbestos, so that the coils of the magnet are well protected from the heat of the arc. The mechanism of the lamp is all mounted on malleable iron bottom plates, so that it may easily be taken from the case of the lamp. The removal requires only the unfastening of a thumb screw which can be reached through an opening in the side of the case. Then the lamp mechanism may easily be swung from the case, moving as it does about a pivot bar at the lower end of the front of the case. The current cables are fastened to terminals on the front of the removable bottom plate.

The manufacturer of the Star headlight heretofore has used aluminum for the reflector of its "Climax" headlight. This practice is not adhered to in the new lamp, but instead of aluminum the reflectors are spun from 18-gauge brass, heavily nickel plated. A reflector of this construction is said to hold its luster far longer and be more easily cleaned than an aluminum reflector. Prominent among the valuable features claimed for the new headlight are the steadiness of the light thrown and the ease with which the length of the arc may be regulated.

The new "Peerless" retriever embodies many improvements in design, which it is thought, combined with the general simplicity, will win considerable favor. One important improvement is found in the method of connecting the trolley rope to the retriever. All that is necessary to make this con-



Parts of the "Peerless" Trolley Retriever, Showing Low-Tension Gear, Which Takes the Place of a Weak Spring.

nection is to tie a firm knot in the end of the rope and insert it in a slot provided for the purpose in the reel.

Probably the most important change from the earlier types of retrievers is the absence of what is known as a "weak" spring. The new retriever has only one spring, which is a retrieving or high-tension spring. The absorbing of the slack, so that the rope may always be kept taut, is accomplished by back gearing attached to the reel, as shown in the engraving. This ingenious arrangement of back gear, as simple as it is, takes the place of the weak spring.

The new retriever is an unusually strong device, built largely of malleable iron. It is arranged with a cushioning feature so that at the instant the trolley wheel leaves the wire the pawls cushion on the retrieving spring and thus do not strike a hard blow on the case, rendering it liable to damage from excessive hammering. Severe conditions of weather are said to affect the new retriever far less than in the former designs. Water can get into the mechanism of the machine only under the most severe conditions, and this is practically impossible if the mechanism is occasionally oiled. In the winter, during ice storms, the new retriever will work better than one of the earlier design, because the large opening provided in the case, together with the large cord space, prevent buckling of the rope, which feature, combined with the strong uniform low tension and the continual working of the trolley, break the ice that may form on the rope and allow the drum to move freely.

G. E. MOTOR PACKING WASTE.

For many years the J. Milton Hagy Waste Works of Philadelphia has manufactured packing waste suitable for journal boxes. Fourteen years ago this company first introduced spun yarn for this purpose. It is now of interest to electric railway operators that the name of one of the popular brands of waste will hereafter be "G. E. Motor Packing Waste."

The yarn in the G. E. motor packing waste is the result of many years' experience and a continued aim to get the best practical packing material that could be sold for the least money. Some of the manufacturer's claims for this waste are as follows:

It is a clean mixture of wool and hair and therefore is resilient and a good absorbent. The possession of these characteristics results in an even lubrication, assuring a low cost for oil.

The waste is clean and the absence of dirt and grit assures that there will be no grinding inside the journal box.

Owing to the care in its manufacture the waste is composed of long strands, which factor materially reduces the amount of waste required for a given service.

The character of the material is such that it may be easily

backed and therefore the labor cost for maintaining journals is low.

As there are neither any jute nor any soluble mordants in its makeup the waste is said to thoroughly guard against hot boxes.

THE TROLLEY ELECTRIC VEHICLE.

Electric railway companies have engaged extensively in the transportation of freight and express during the past few years, but the small package business in cities has not received the attention which it deserves. This has been largely on account of the lack of a suitable medium for transporting small units and the lack of facilities for delivering packages directly to their destination. The Trolley Electric Vehicle Company of Philadelphia has a vehicle, invented by Russell Thayer, president of the company, which is designed to meet the requirements of small units and facility of delivery at any point. The trolley electric vehicle may be constructed of any desirable type for operation over the tracks of a street railway or on the surface of the streets. While traveling on the car tracks it is propelled by the current from the trolley circuit, which is received through a trolley pole, and while traveling on the streets it is propelled by current from a storage battery.

The accompanying engraving from a photograph shows a 5-ton trolley truck, which has been thoroughly tested in commercial service in Pittsburg. This truck is equipped with four 110-volt 2½-horsepower motors, one to each wheel, and while on the tracks receives 500-volt current with the motors in series. While operating independently of the trolley circuit current is obtained from a 42-cell storage battery, furnished by the Electric Storage Battery Company of Philadelphia, and

Trolley Electric Vehicle—Five-Ton Truck Running on Car Track.

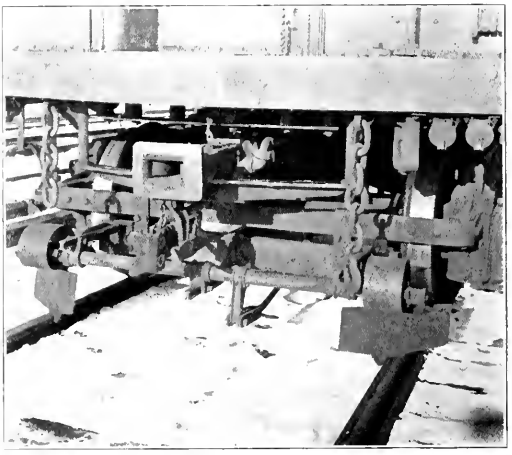
the motors are connected in parallel. The motors are geared to a speed of 22 miles per hour on track and 8 miles per hour on the streets.

A 1-ton truck of this type has been tested in Pittsburg for about two years, in making deliveries from railroad stations to merchants and in transporting provisions from merchants to consumers. Tests have also been made with trucks of 3, 5 and 10 tons capacity. The 5-ton type, which is illustrated herewith, has been used for about six months. The trucks have been operated over the street railway tracks under an arrangement with the Pittsburg Railways Company and have fully demonstrated their ability to run over the tracks at the schedule speed of the street cars without interfering with the cars. Experience has shown that in usual business the truck operates for about 90 per cent of the distance over the tracks without drawing upon the storage battery. The battery is charged at night, but in the heavier types of vehicles it is planned to recharge the battery from the trolley circuit.

Among the advantages claimed for the truck are the following: It has a much more extended radius of action than the ordinary electric vehicle, as it can run for most of the distance without drawing on the battery, and at the same time uses current from the most economical source. It may be profitably operated at night, thus making use of power equipment which is ordinarily performing no service at the time. It may be used to transport passengers to parks or other portions of a city where tracks may not be laid. It occupies less space in the street than a horse-drawn vehicle and is thus a lesser obstruction to traffic while performing a more efficient service.

THE ROOT TRACK SCRAPER.

The illustration presented herewith shows a heavy track scraper in operating position on one of the Philadelphia Rapid Transit Company's elevated cars. This type, known as the Root scraper, is manufactured by the Kalamazoo Railway



Root Track Scraper in Operation.

Supply Company, Kalamazoo, Mich., and is designed for heavy work and high-speed service. The springs are manufactured of 90 per cent carbon, oil-tempered spring steel, while the shovels are made of 75 to 80 per cent carbon spring steel.

Very small space is required for the installation of the Root scraper, and by the use of the desired length of brackets and chain it may be installed on any height of car above 19 inches from the top of the rail to the bottom of the sills or platform knees.

The Root scraper has given satisfactory service on many important electric railways for the past five years.

A NEW RAILWAY MOTOR PINION.

The General Electric Company, Schenectady, N. Y., reports that the remarkable properties which are exhibited by the new "Grade F" pinion now being placed on the market, have caused a number of railways to introduce it in various classes of service. The physical characteristics of tensile strength and elastic limit are greatly in excess of those ordinarily found in this part of the equipment and the claims that one of these pinions will outlast three ordinary pinions is apparently well founded.

As the vital factor of gear economy is the maintenance of the correct outline of the teeth, it is frequently, if not generally, necessary to replace the pinions two or three times during the life of a single gear. The substitution of "Grade F" pinions for the ordinary soft pinion will, therefore, eliminate all the expense for these renewals as well as prevent the inefficient operation of pinions with worn teeth. Worn pinion teeth produce among other evils an increased demand on the power station, excessive wear on motors and trucks and a highly objectionable noise. Even without the economy in renewals, therefore, a pinion having a life approximately equal to the gear is a good business investment.

The General Electric Company is furnishing the "Grade F" pinion on all new equipments.

Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Wanted—Position as armature winder and mechanic. Ten years' experience. Can furnish good reference. Address "No. 586," care of Electric Railway Review, Chicago.

Want work on right of way, franchises, stock sales, etc. Promotor's right-hand man. Always in harness. Reliable and experienced. Address "No. 588," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Wanted—Position as superintendent of rolling stock or master mechanic on city or interurban railway. Have satisfactorily handled similar work on large metropolitan properties since horse car days. At liberty now; references exceptional. Address "No. 580," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

General manager wanted for combined electric railway, electric light and gas property, operating 25-mile city and interurban railway located in middle west. Promotion assured for capable man. Must be able to handle relations with public, as well as operate property economically. Address "No. 589," care of Electric Railway Review, Chicago.

BUSINESS OPPORTUNITIES.

Wanted—To exchange, first mortgage gold bearing 5½ per cent bonds for material for electric railway, issue limited as to amount per mile; right of way held by company in fee simple. Those interested address Chicago Ottumwa & Western Railway, Hamilton, Ia.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

Wanted—Copies of Street Railway Review, January to June, 1906, inclusive, and one copy each January and February, 1906. Also Electric Railway Review for January 5, 1907. State condition and price. Address "No. 582," care of Electric Railway Review, Chicago.

Raising Capital for Railways.

The success which attended the offering of $25,000,000 notes of the Interborough Rapid Transit Company of New York and the announcement of plans of the Public Service Corporation of New Jersey and other companies for financing are signs of awakened interest in the bond market. Idle funds are accumulating rapidly in banks. The decrease in activity in general business has released so large a volume of money that bankers are finding it difficult now to loan deposits at satisfactory rates of interest. The extent of the increasing volume of idle money in the country is shown by the gradual decline in interest rates, particularly in New York, where money has reached the low rates of 1½ to 2 per cent on call and 3½ to 4 per cent on time. Announcement of the plans of larger companies will be followed gradually by the completion of plans of smaller railways for funding floating debt and for raising capital to build extensions which were abandoned on account of the development of acute distress in the business world last October. With the return of public confidence underwriting bankers will buy securities freely. Each day that passes now improves the prospects of sound electric railway properties for raising funds for capital purposes at favorable rates of interest.

Cause and Effect.

One superintendent of equipment attributes his success in obtaining low labor costs for repair work to his following the axiom, "Correct the cause of the trouble and the effect will take care of itself." These are not the exact words but they convey the correct meaning. The principle in this axiom, of course, is applicable to any line of work and yet, with the very complicated machines known as electric railway motor cars, it would seem that if the axiom is a good one it could not be applied to any other line of work with more beneficial results than to rolling stock maintenance. It is a quite frequent practice to employ a comparatively large number of men whose duties comprise only the replacing or repairing of parts which have been broken down either accidentally or by continued service. If a little more thorough study and a little bit better application of engineering principles will enable a master mechanic to improve upon the design of or the material in these parts which so frequently need replacing, it is only fair to presume that in this way his existing payroll will remain the same, even though the management considerably increases the number of rolling stock equipments which his same shop must maintain in good operating condition. Results in the shops under the charge of the superintendent earlier referred to illustrate this principle. Five years ago the company operated 185 motor and trailer cars. Today this same company requires for its service 400 cars and all of the motor cars are now equipped with multiple-unit control where, in the earlier days, platform control was used. Even though the total number of equipments has more than doubled and the proportionate number of motor cars has increased in more than a two-to-one ratio, yet the numbr of men engaged in maintaining and repairing these equipments remains the same. We repeat that the responsible head in charge of this work attributes this result to his practiec of teaching the men to ascertain and repair the causes of defects rather than look only for the cheapest way to renew the parts.

Engineers and the Purchaser.

When an important power system installation or modification is carried out under the direction of a firm of consulting engineers, it is the usual practice for all apparatus to be purchased through the organization handling the work as a whole. This is the natural outcome of the preparation of plans and specifications in the office of the engineering organization, and the close supervision of the installation of the machinery in the field which the experts retained are expected to give. Repeat orders of standard apparatus parts are, however, often handled through the regular purchasing organization, if the road has one, or if not by the general manager or superintendent acting as purchasing agent. It is an open question if the purchase of supplies cannot sometimes be carried on to advantage through the consulting engineering organization in addition to the purchasing department, in view of the present lack of complete information so often encountered as to the best material or machine for a given purpose. In other words, the purchasing department may need technical co-operation in the buying of certain supplies no less than in securing quotations and recommending acceptances on larger apparatus. The staff of the company may be capable of handling the problem in the best way, but during a period when an experienced firm of engineers is retained there is no doubt that on some occasions their advice would be as valuable in the selection of supplies as it would in the buying of heavy machinery.

Massachusetts Electric and Steam Roads.

The Massachusetts supreme court has declared that the New York New Haven & Hartford Railroad is illegally holding control of trolley lines in Massachusetts, in which it has invested about $13,000,000. The effect of this decision is to bring to the front in Massachusetts the problem of trolley line control by steam roads and to demand a prompt determination of the policy of the state in this respect. The number of street railways affected is 16, with $11,626,200 stock, $6,360,000 funded debt, $3,234,004 notes payable and covering altogether 565 miles of track. Fifty-six towns in the state, with an aggregate population of about 240,000, are reached by these lines. The fundamental question involved is the desirability of electric street and interurban railway control by a steam railroad operating in the same territory. In the Berkshire district of Massachusetts it has generally been conceded that the New Haven road's ownership of the trolleys has been of public advantage, resulting in electric service for localities that otherwise could not have supported it for many years. The tendency of the times is toward centralized management of transportation properties. Many of the accepted standards of steam railroads differ radically from those of electric railways, but electrification of the steam roads in certain sections and the march of progress have done much to destroy old-fashioned ideas in each character of service. No steam railroad officials in the country have had better opportunities than those of the New

Haven road to become acquainted with the manner in which the steam road and the trolley system may supplement each other. The Massachusetts legislature should take action upon this question with the least delay consistent with adequate consideration in order that far-reaching plans of the New Haven interests for developing modern transportation facilities in New England may be carried to satisfactory completion.

Revised Accounting System.

The revised interstate commerce commission classification of operating expense accounts for electric railways, published in another part of this issue, wisely provides for a maximum of 88 primary accounts. As announced in an earlier issue of the Electric Railway Review, the division of companies has been changed radically from the plan tentatively suggested in Circular No. 20. In accounting for operating expenses, railways will be separated into three classes, and companies with gross annual revenue of less than $250,000 will be required to keep but 36 primary accounts. The scheme of division in classes according to gross revenue is like that outlined by the New York public service commission, second district, in its classification for electric lighting and gas corporations, and is a fairer recognition of the varying accounting requirements of large and small companies than the plan originally proposed. In preparing a uniform system it is right and just for public service regulating bodies to conform their requirements as closely as possible to a system which, while assuring integrity in accounting, will meet the needs of the practical men to whom the details of application must necessarily be left. In order that such a system of accounting may receive substantially unanimous acceptance, it is essential that there be co-operation between the companies and representatives of the public service commissions. By means of such co-operation the present scheme has been produced. If the details are prepared by similar conference the result should meet with general approval from the companies affected.

Cost Data and Purchases.

Some one has said that few electric railway companies have sufficient detailed knowledge of the life and cost of supplies. This statement probably will apply equally as well to the knowledge of the life and cost of wearing parts of equipments under various conditions of service. There are some good reasons why electric railway companies are not especially well versed in these matters. These reasons may be summarized by saying the expenditure of time and money in keeping records and making tests is hardly justified when there are available the resources of consulting engineers' offices. Generally the data collected by electric railway companies are the results of short tests made on a few cars or machines, and these of special types. Therefore the results are not applicable to electric railways at large, although they are valuable enough for the purpose for which they were collected at the time. The consulting engineer interested in widely scattered properties or the home office of an electric railway syndicate is best able to compile life and cost data which will be valuable as a basis for accurate conclusions made at the time of purchasing supplies. Because of the wider view of the field of operation the consulting engineering organization is frequently in a position to give a valuable opinion as to the fitness of certain supplies for any definite service. The desired result is then obtained, money is saved and the operating company, through the avoidance of needless experimenting and because of closer inspection of quality, is relieved of much unnecessary expense. Also a large consulting engineering organization may find itself able to purchase supplies on a larger scale, dividing them among its clients. Here also a saving will be shown. When the consulting engineer is called upon to advise in the choice of supplies or even buy them, the purchasing department of an electric railway still will have work enough to do though its activities may be supplemented with the advice of the engineer.

AUTHORITY OF THE INTERSTATE COMMISSION.

In the case now awaiting decision by the interstate commerce commission, involving the 10-cent cash fare charged by the Omaha & Council Bluffs Railway & Bridge Company from Council Bluffs to Omaha, the most important point to be decided touches the authority of the commission to assert jurisdiction over the company.

The Omaha & Council Bluffs Railway & Bridge Company owns a street railway and toll bridge over the Missouri river at Omaha, and a line of street railway beginning at the west end of the bridge in Omaha and extending eastward over the bridge and into Council Bluffs, Ia. The company also owns the stock and bonds of the Omaha & Council Bluffs & Suburban Railway, and owns and operates all the street railway lines in Omaha and in the adjoining municipalities of South Omaha, East Omaha, Florence, Dundee and Benson. The local fare in Council Bluffs or Omaha is 5 cents. The fare from any point in Council Bluffs to any point in Omaha, including the bridge toll, is 10 cents, except for commutation passengers, who receive a 5-cent rate. A toll of 5 cents is paid by foot passengers over the bridge.

It is admitted that the properties concerned are engaged in interstate commerce, but the position of the company is that street railway companies are not railroads within the meaning of the act to regulate commerce. To interpret the term "common carrier," as used in the act, as applicable to street railways, would lead to embarrassments if the commission, in the exercise of its power, attempted to force a street railway to make a connection with a commercial steam railroad and to furnish cars for the transportation of freight. The attitude of members of the commission has been that the act applies in all its phases to both electric and steam railways engaged in interstate transportation of property. The extent of the application of the act is raised definitely in this case and the decision of the commission must take into consideration the vital point of its lawful right of jurisdiction over electric carriers not engaged in freight traffic. It is shown, for instance, that urban interstate street railways may be owned by companies incorporated for the transportation of passengers only, while interurban electric railways may be incorporated under state laws and empowered to carry both passengers and freight. The brief filed by the company before the commission argues with these points for segregation of railways of its class from those which more nearly approach the steam roads in most essential respects except that of the motive power employed. In other instances, where the point of jurisdiction has been brought before the commission the question for decision has been whether the act under which the commission derives its power applied to both steam and electric roads.

In addition to the argument in support of the contention that the commission has not jurisdiction, representatives of the company stated that the evidence did not disclose that either the complainant, the West End Improvement Club of Council Bluffs or its individual members have any interest, directly or indirectly, in having the fare reduced or that they are in any way damaged or inconvenienced by the cash fare. It was shown that 90 per cent of the passengers on the bridge line traveling between the two principal connected cities rode a distance of about five miles for a single fare. The company also submitted that there is no evidence that a reduction in fare would result in increased travel and that no persons living in Council Bluffs refuse to travel on account of the 10-cent fare. Evidence was submitted in relation to the expense of maintenance of the bridge, and to show that it is the custom to charge a 10-cent fare on street

railway lines operating between cities located on opposite sides of the Mississippi and Missouri rivers, in illustration of which there were cited the instances of St. Louis and East St. Louis, St. Paul and Minneapolis and Sioux City and South Sioux City. On two separate bridges connecting Council Bluffs and Omaha, the proprietor steam railways charge 25 cents fare in each instance.

In the hearing of the complaint concerning the 10-cent fare it was shown by the company that the result of a reduction in fares from 10 cents to 5 cents would be a loss in revenue on the bridge line, based upon the number of passengers who paid the higher fare in 1907 of $102,921. The reduction of fares would therefore be disastrous. The complaint on which the commission has acted appears to be based upon the old theory of a 5-cent fare without scientific investigation of the length or expense or haul or the cost of maintenance and provision for depreciation. The public should be shown in every way possible that a 5-cent fare is not necessarily adequate if provision is to be made for all expenses and if unlimited rides and transfer privileges are bestowed.

STANDARDIZATION COMMITTEE MEETING IN PITTSBURG.

The standardization committee of the American Street and Interurban Railway Engineering Association met at the Fort Pitt hotel, Pittsburg, Pa., on May 7, 1908, at 10 o'clock a. m. There were present W. H. Evans, chairman; M. O'Brien, J. M. Larned, H. W. Blake, C. B. Fairchild, Jr., and L. E. Gould; and also by invitation E. Sidney Lewis, Standard Steel Works, Philadelphia, Pa., and F. W. Sargent, American Brake Shoe & Foundry Company, Mahwah, N. J.

The chairman outlined the work for the year as agreed upon at a meeting of the executive committee of the association in New York City on January 30, 1908, when it was decided to take up for the consideration of the committee on standards for this year the subjects of standard height of couplers for city and interurban cars, standard automatic couplers and radial draft rigging for interurban cars, standard height of platforms, standard height of car steps and standard height of bumpers, and such other minor subjects as the committee might decide best.

F. W. Sargent explained in full the drawings which were submitted as standard on brake shoes and brake heads last year, stating that there were no changes whatever in the essential details of the drawings as published in the report of the standardization committee. The drawings simply would supply more explicit detail for the pattern makers to work from, and be a little easier understood. It was understood that these drawings were for the purpose of full-size reproduction in detail, which it is the intention of the committee to have prepared for general circulation.

E. Sidney Lewis advised that there were no changes to suggest in regard to the wheel tread and flanges and other wheel dimensions which were adopted by the committee as standard last year.

The committee will advise the association that it has no changes to suggest in the standards as adopted last year. It will also recommend that the association issue full-size working drawings of all the standards. These should be on sheets of uniform size and lithographed or printed on transparent paper, so that blue prints could be taken from them; these sheets to be for sale by the secretary of the association in connection with such pamphlets or reports of the standardization committee as may contain full explanations of standards as adopted.

Considerable discussion was had regarding the results obtained from sending out data sheets, and just how this work should be handled in order to get the best results. It was considered advisable to have the forthcoming data sheets sent out, if possible, in connection with the issue of the reprints of the reports of the standardization committee.

The committee was favored with the presence of I. H. Milliken, McConway & Torley Company, Pittsburg, and J. L. Hopper, Washburn Steel Castings & Coupler Company of Minneapolis, Minn. They spoke at some little length regarding automatic couplers, and both agreed that with some slight variations the M. C. B. type of coupler could be made available for interurban car use, both for pulling and pushing, and avoid the trouble previously experienced with M. C. B. couplers, that is, buckling out in pushing around short radius curves. They had no doubt that a satisfactory coupler could be designed for this purpose, which would be thoroughly interchangeable with the so-called M. C. B., or steam road type of coupler.

The committee was unanimously of the opinion that it would be well to send out circular letters to the car builders, coupler companies, step builders and all other manufacturers directly affected, which could give information regarding standard heights of the different parts and any other information bearing upon the subjects considered by the committee this year. In this connection, considerable discussion was had as to the provisions to be made which would prevent interurban cars from passing over city cars on account of the unequal height of the platforms. It was suggested that any plans or devices or information bearing on this subject would be valuable addition to the report of the committee.

Through the courtesy of J. M. Larned, F. Ulenhaut, Jr., and other officials of the Pittsburg Railways Company, the committee was entertained in the evening.

In the second day's sessions the committee discussed the different questions which were shown on the proposed data sheets for this year, and it was decided that it would be well for the committee to take some definite action as to certain dimensions which they would recommend as standards. This, of course, was tentative until the receipt of general information from the data sheets, and until these had been thoroughly discussed. The committee agreed to suggest the following dimensions:

Height of couplers for interurban cars, from top of rail to the center of couplers, 35 inches.

Height of couplers for city cars, from top of rail to the center of couplers, 20 inches.

Height of car steps, from top of rail to first step, 17 inches. From top of first step to top of second step, 14 inches. From top of second step to the top of third step, 10 inches. It is understood that for drop-platform cars the second step of 14 inches will reach the platform, placing the platform 31 inches above the rail, and the third step (from the platform to the floor of the car), 10 inches, placing the floor of the car 41 inches above the rail.

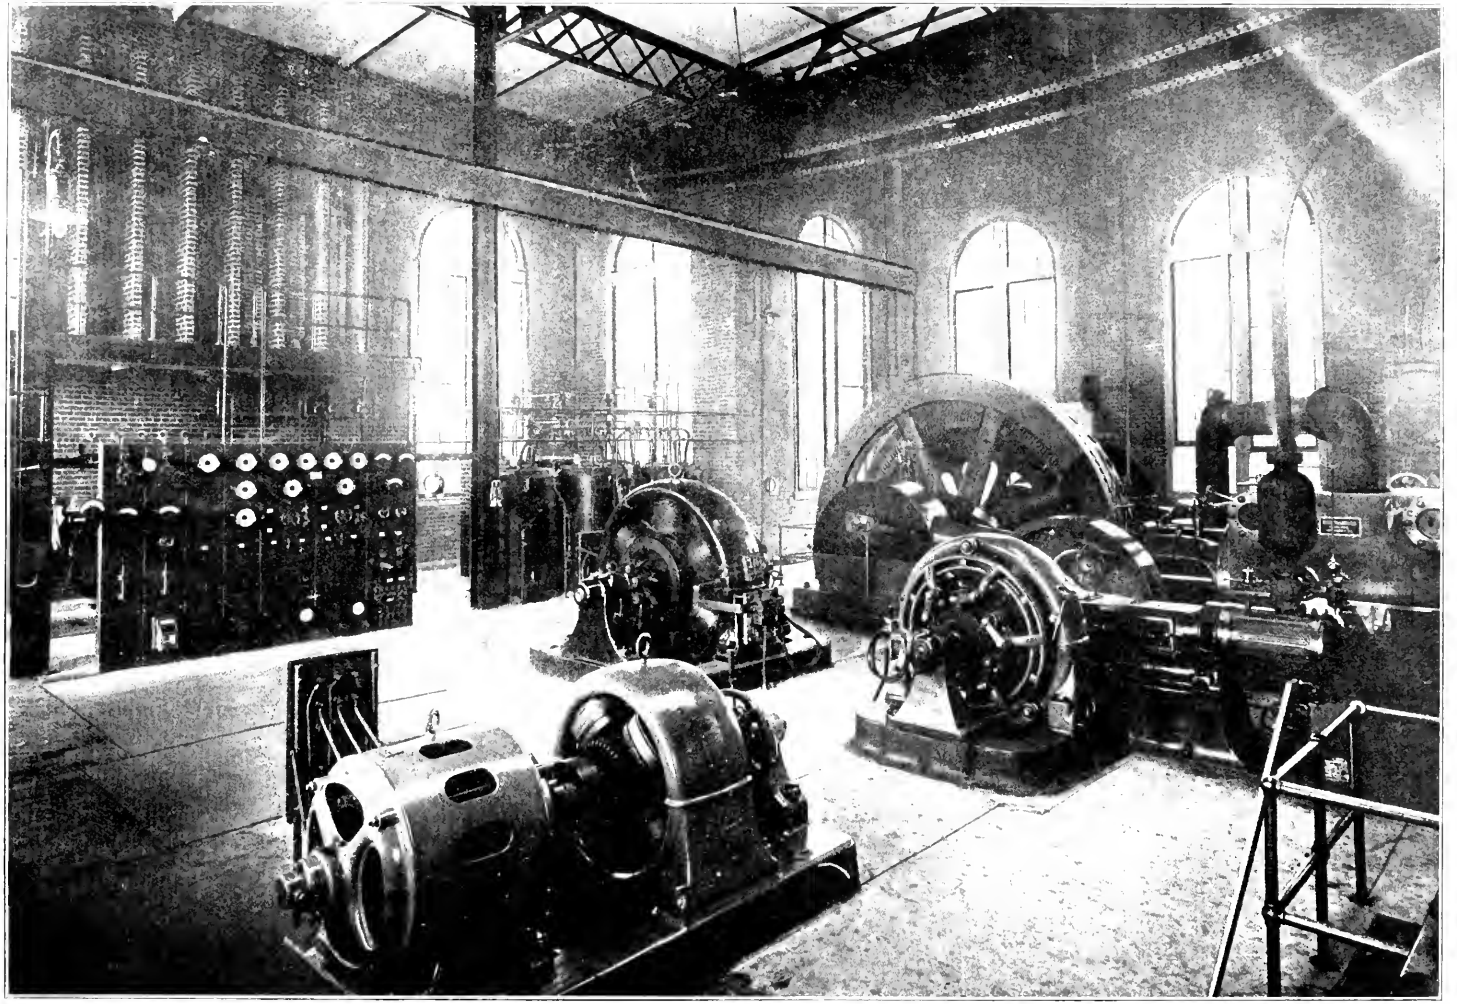
For standard couplers for interurban cars, it was considered that a type of coupler which would be interchangeable with the so-called M. C. B., or steam type of coupler for steam roads, would be the most desirable.

For city cars, owing to the fact that couplers are of different heights, it was considered very difficult to devise an automatic coupler which would successfully operate for these varied conditions; but, if possible, this should be done.

It was decided to call a meeting of the committee at the Clifton hotel, Niagara Falls, Ontario, on Monday, June 29, 1908, at 10 a. m. A delegation is expected, representing the different manufacturers of couplers, car builders and other companies, who will be present for the purpose of giving information bearing on the subjects under consideration by the committee this year.

It was further decided that the committee would meet informally at the same place on Sunday, June 28, 1908, at 2 p. m., to discuss the various data and work of the committee members previous to the regular meeting.

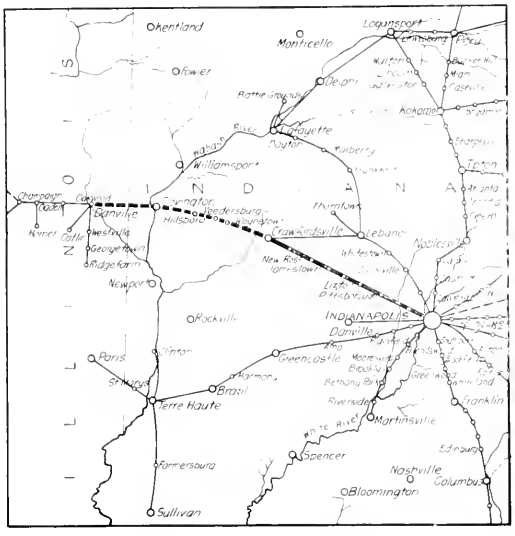
Through the courtesy of J. M. Larned and the Pittsburg Railways Company, the members of the committee and others were given a trolley ride through the manufacturing sections of Pittsburg and to the works of the Westinghouse Electric & Manufacturing Company.



Ben-Hur Route—Interior of Crawfordsville Power Station, Showing One Main Generating Unit, Rotary Converter, Exciters, Transformers and Switchboard.

THE RECENTLY COMPLETED RAILWAY OF THE INDIANAPOLIS CRAWFORDSVILLE & WESTERN TRACTION COMPANY.

The Indianapolis Crawfordsville & Western Traction Company, popularly known as the Ben-Hur Route, now has in operation an especially well-built high-speed interurban trolley line between Indianapolis and Crawfordsville. The ultimate terminals of this road will be Indianapolis, Ind., and Danville, Ill. The present line is 45.1 miles long, serving the towns of Clermont, Brownsburg, Pittsboro, Raintown, Lizton, Jamestown, New Ross and Linnsburg, located between the terminals. At Indianapolis the cars reach the Traction Terminal station by a run of three miles over the tracks of the Indianapolis Street Railway. Between terminals the route closely parallels that of the Cleveland Cincinnati Chicago & St. Louis Railway. Accompanying illustrations show the general character of the property and illustrate in detail some of its many interesting constructional features.

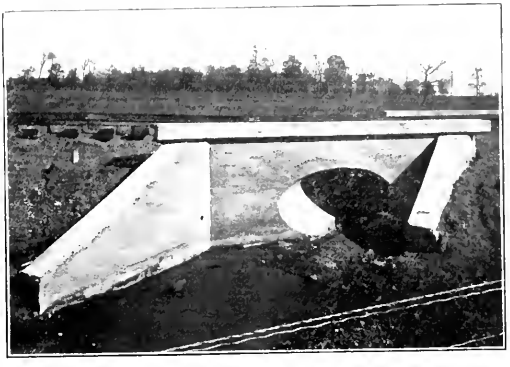


Ben-Hur Route—Map of Operating and Proposed Lines.

The nature of the country traversed by the new line permitted the construction of a remarkably straight roadbed with low grades. There are no curves on the private right of way sharper than 3 degrees and 30 minutes and the maximum grade is 1¼ per cent. The bridges along the route are of substantial design, well constructed and amply strong to safely carry the heaviest traffic.

Track and Roadway.

There are two steel bridges—one a through high-truss bridge, 150 feet long, over Big Eagle creek, and the other of the same type over White Lick creek, with a span of 108 feet. All other bridges and waterways on the line are constructed of reinforced concrete in accordance with the Kahn system. Most of these concrete structures are of the girder or slab type, but in two instances semi-circular arches are employed.

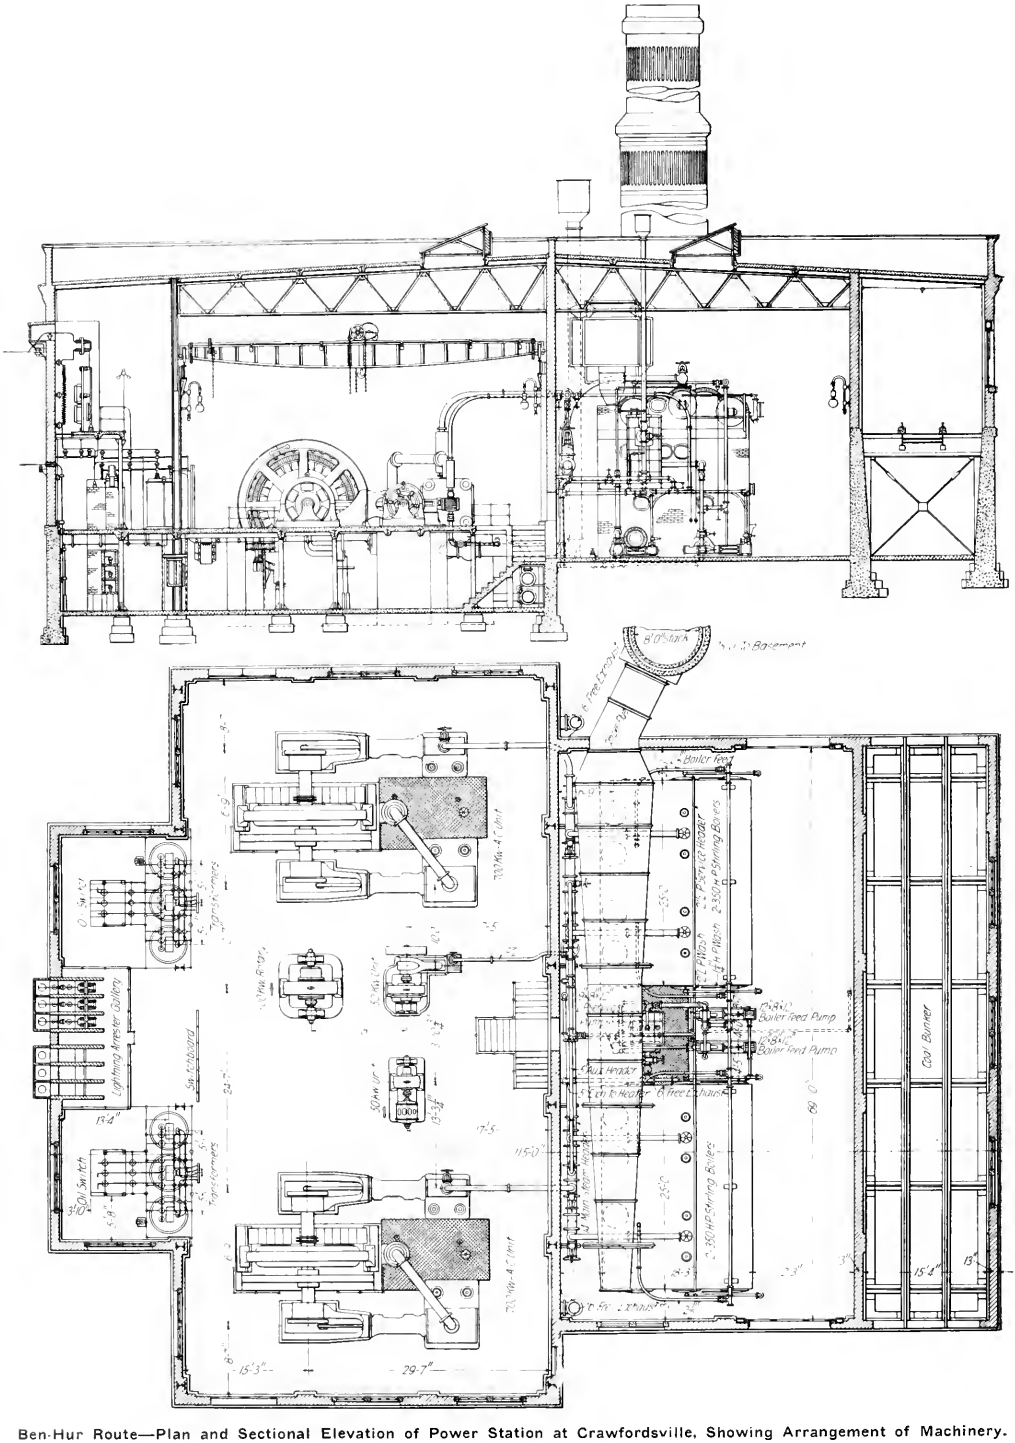


Ben-Hur Route—Concrete Barrel Culvert.

A branch of the Big Four Railroad crosses the new line at grade five miles from Indianapolis. This crossing is protected by an interlocking plant jointly maintained. The only other crossing with a steam road on the high-speed section of the line is at New Ross, where the Central Indiana Railroad is intersected.

The interurban track is laid with standard 85-pound T-rails from Indianapolis to Brownsburg, and from Brownsburg to Crawfordsville a 70-pound section is used. The track is all laid to standard gauge on approximately two thousand

Ben-Hur Route—Flat Top Ballasted Floor Concrete Bridge.



Ben-Hur Route—Plan and Sectional Elevation of Power Station at Crawfordsville, Showing Arrangement of Machinery.

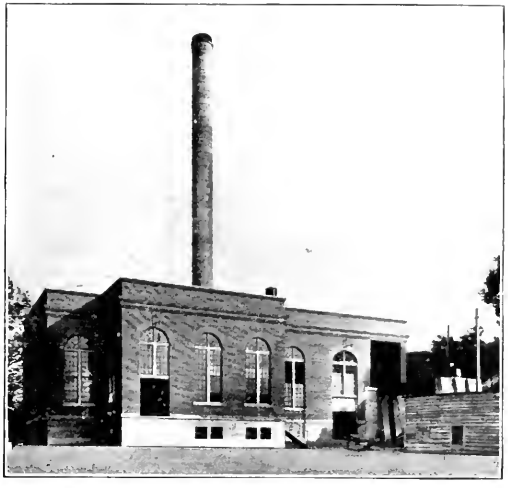
eight hundred 6 by 8 inch oak and chestnut ties per mile. The rails are spliced with standard 4-bolt angle bars. All the rail bonds are of 250,000 circular-mil cross section. For half the track soldered bonds were used, supplied by the Lord Electric Company, and for the remainder of the work a 10-inch United States pin-driven terminal bond, manufactured by the American Steel & Wire Company, was used.

Overhead Line Construction.

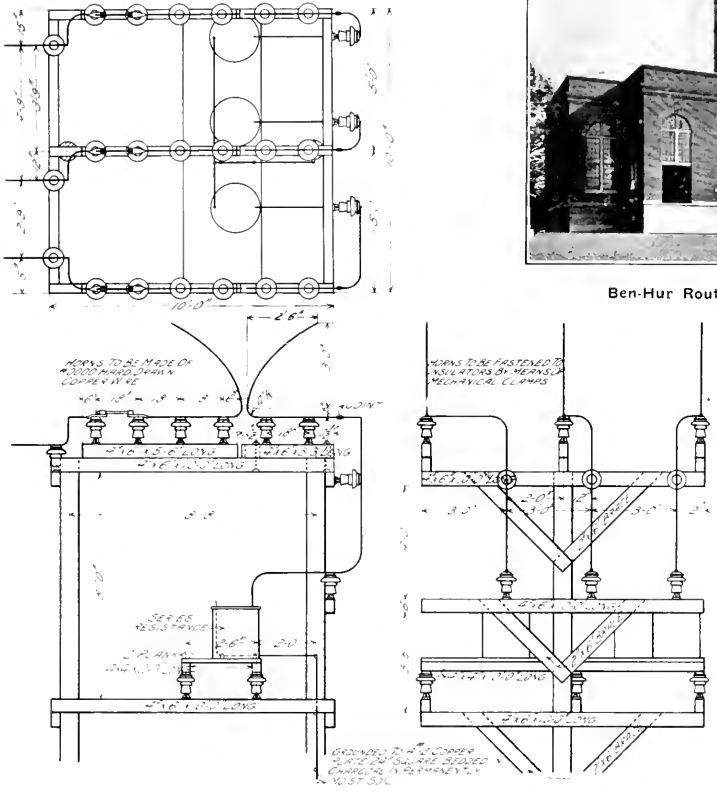
The trolley circuits are fed from a generating station at Crawfordsville through the medium of four substations—one located in the power station and the others spaced approximately 13 miles apart toward Indianapolis. Current is distributed to the outlying substations at a potential of 33,000 volts. The transmission line comprises three No. 4 B. & S. gauge bare copper wires, carried on No. 3026 Thomas 3-piece porcelain insulators, 8⅝ inches in diameter by 8¼ inches high, cemented on malleable iron pins. All three of the transmission wires are carried on a single 10-foot crossarm, placed at the tops of the trolley line poles. The transmission line is transposed every two miles, so that the wires are given two complete spirals between substations.

An accompanying illustration shows the general dimensions of a line pole and the arrangement of its fittings. The poles, of Missouri cypress, 40 feet long, with 9-inch tops, are spaced 105 feet apart along tangent track. The butts, gains and tops of the poles were brush-treated with carbolineum. In the cities of Indianapolis and Crawfordsville iron poles are used to carry the trolley line.

The trolley line comprises a No. 000 deep-grooved wire, supported from galvanized hangers with 12-inch clinch ears hung from flexible brackets 10 feet long. All of the insulating materials for the direct-current circuits were supplied by the H. W. Johns-Manville Company, while the brackets, ears and overhead fittings were furnished by the Electric Service Supplies Company. The trolley line is fed by a low potential copper feeder, 400,000 circular-mils in section, which is supported on crossarms and glass insulators placed on the poles above the trolley brackets and below the high-tension cross-



Ben-Hur Route—Power Station Building.



Ben-Hur Route—Details of Horn Type Arrester for Protection of Transmission Line.

arms. Carried on this same crossarm are two No. 9 B. W. G. iron wires, which are used for a private telephone system. This telephone line is connected to jack boxes placed on the poles every half mile, and at all sidings, for use in train dispatching. In addition to these boxes telephones are placed in each of the stations, so that all agents of the company can communicate with the main office in Crawfordsville over the company's private telephone system. The direct-current overhead circuits are protected from lightning by Garton pole arresters.

Generating Station.

While the electrical apparatus in the generating station and substations is fully protected with lightning arresters, it has been thought advisable to install several horn type arresters for additional protection of the 33,000-volt transmission line. The general design of one of these arresters is illustrated.

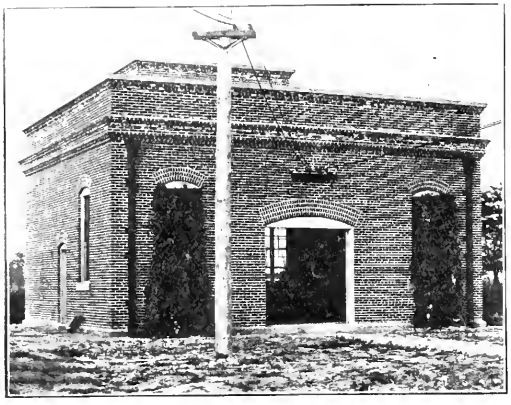
The power-generating station is in a fireproof building, constructed of reinforced concrete, brick and steel, located adjacent to Sugar creek in Crawfordsville. Drawings showing plan and sectional views of this building are presented. It will be noted that the building is divided into three parts: a coal bunker, into which coal can be unloaded from hopper bottom cars, the storage capacity being 650 tons; a boiler room, in which are boilers, auxiliaries, and the main steam pipes;

and an engine room containing the main units and electrical auxiliary apparatus.

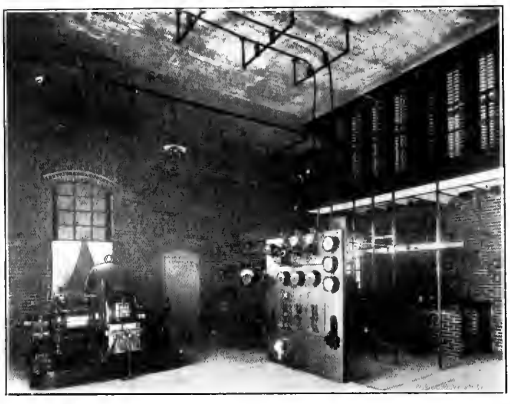
Steam is generated in four Stirling water tube boilers of 3,500 square feet of heating surface each. The boilers are fed by outside center-packed plunger pumps, which obtain their supply by gravity from a Webster open feed water heater, which is filled from the water supply system by piston pattern low-service pumps. There are two pumps of each type, each pair being of ample capacity to take care of the entire amount of water required for all of the boilers.

The furnace gases from the boiler are carried to a Weber reinforced concrete-steel chimney, 8 feet internal diameter and 175 feet high through a large steel smoke flue, placed above the boilers. This chimney and smoke flue is of sufficient size to take care of the probable future requirements of the power station.

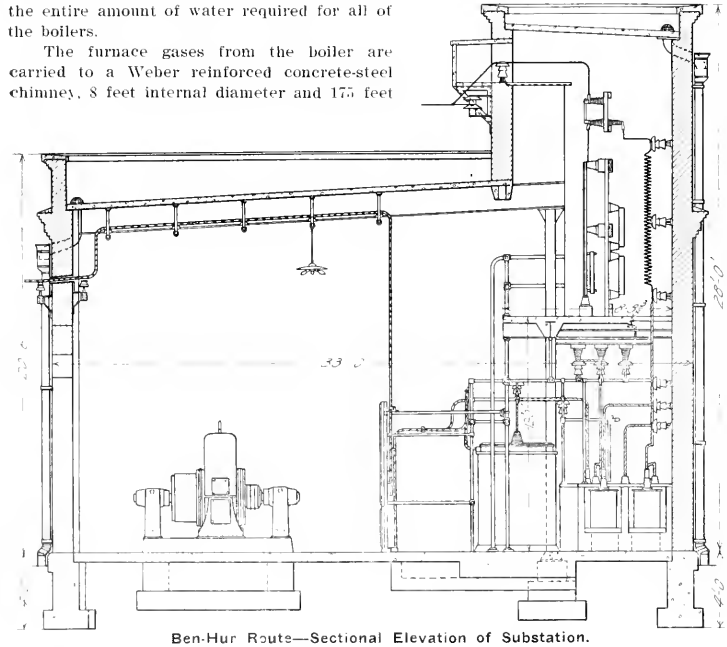
In the engine room are two Allis-Chalmers-Bullock 700-kilowatt 25-cycle three-phase 405-volt alternators, direct-connected to Allis-Chalmers 20 and 42 by 42 inch cross-compound engines, operating at 107 revolutions per minute under a steam pressure of 150 pounds per square inch and 26 inches of vacuum. Each of these units is provided with a condensing equipment, consisting of Dean jet condensers with direct-acting air pump. All steam and water connections between the various pieces of apparatus are of the highest grade, and are provided with all of the necessary auxiliary and automatic devices. The live steam piping is designed for a working pressure of 250 pounds per square inch in order to have a large factor of safety. All high-pressure steam pipes, separators, boiler, drum-heads and receivers are covered with asbesto-sponge felted pipe covering, 1½ inches thick, and low-pressure lines are covered with the same material 1 inch thick. The pipe covering was furnished and applied by the H. W. Johns-



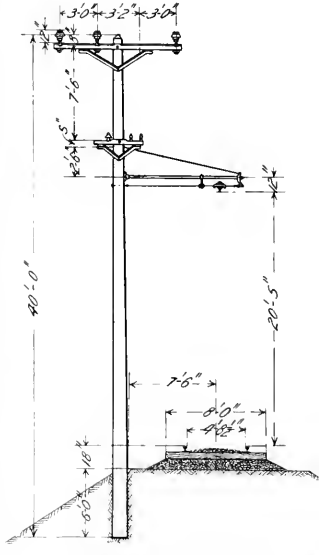
Ben-Hur Route—Substation Building.



Ben-Hur Route—Interior of Substation.



Ben-Hur Route—Sectional Elevation of Substation.



Ben-Hur Route—Pole and Track Dimensions.

Manville Company. Oil for lubricating the two main engines is obtained from a central gravity oiling system, which includes an overhead gravity tank, receiving tank, Turner oil filter and duplex steam pump.

The current for exciting the rotating fields of the generators is obtained from either a 50-kilowatt 120-volt generator, driven by a simple Ideal engine, or from another generator of the same electrical characteristics, but which is driven by an induction motor; the idea being to use the steam-driven exciter generator when starting the plant and then use the motor-driven machine after the plant is in full operation for the sake of economy. Power for station lighting is also obtained from these units, and the engine-driven machine is used for this purpose at night after the rest of the station is closed down.

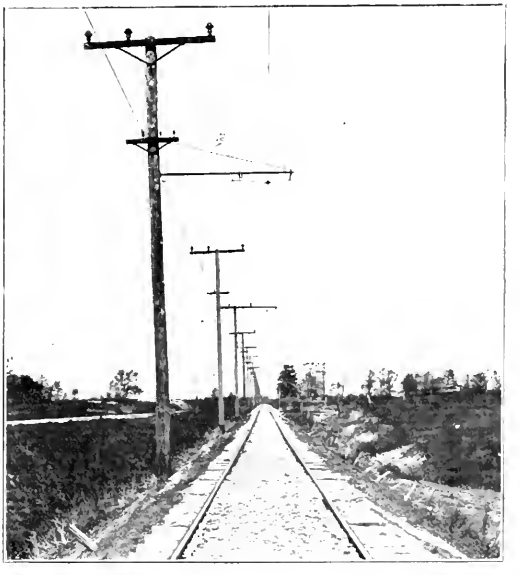
The power furnished by the main generators is fed to low-tension busbars through automatic oil switches, and from the busbars it is delivered to the low potential side of water-cooled raising transformers. After passing through the transformers the power is at a potential of 33,000 volts, and at this potential is fed through oil switches to high-tension busbars, which are carefully inclosed in brick and concrete compartments in the engine room basement. To these busbars the main automatic oil switch for control of the outgoing lines is connected.

Ben-Hur Route—Shop and Car House.

The main power station also includes a 300-kilowatt rotary-converter equipment, which is fed directly from the generators at 405 volts, and converts the alternating current at this potential to continuous current at 650 volts for feeding the nearby trolley line.

All the electrical apparatus in the station is controlled from a Monson slate switchboard built by the Western Elec-

Ben-Hur Route—Interior of Limited Car.

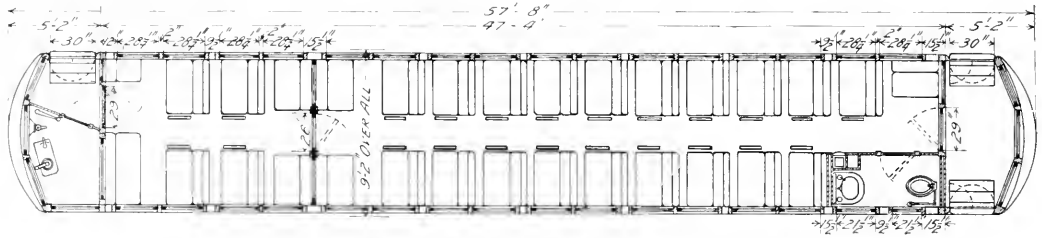


Ben-Hur Route—Track and Overhead.

tric Company, upon which ITE circuit-breakers, Westinghouse oil switch control handles and instruments are mounted. No high-potential current is carried to the switchboard; the control of the high-potential circuits is accomplished by means of an auxiliary low-potential control system.

In order to protect the electrical machinery in the station from high-potential charges induced by lightning an equipment of 35,000-volt Westinghouse low-equivalent arresters has been installed in a gallery above the switchboard. These arresters are carefully connected to ground and so placed that they are always within view of the station attendant.

The water supply system is unique. When the power station site was chosen it was found that the stage of the water in Sugar creek varied about 17 or 18 feet at different seasons of the year, and in order to place the power station building at a sufficiently high level to be above high water it was found that an excessive lift would be imposed upon the pumps. About a mile up stream from the power station there is a dam across the creek and from this dam a mill race had been built to supply water to a grist mill located on the opposite side of the creek from the power house site. At the low-water stage the level of the water in the race at the mill was about 14 feet above the creek. Advantage was taken of this condition and a 30-inch cast-iron flume was built from the mill race, passing under the river and rising to a pumping basin on the power house side. This, of course, caused the water in the pumping basin to stand at a level of about 14 feet above the low-water stage of the creek and solved the difficulty of excessive lift for the pumps.



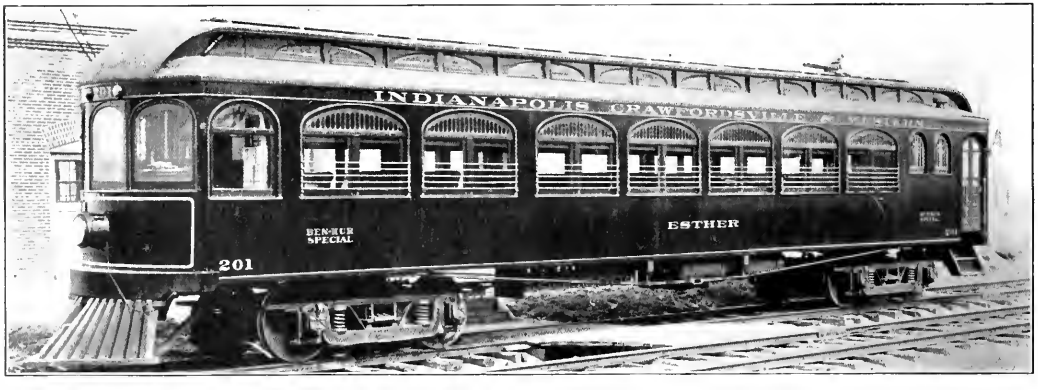
Ben-Hur Route—Dimensions and Seating Arrangement of Limited Cars.

Substations.

The substations, located approximately 13 miles apart, are at New Ross, Pittsboro and Carter. The buildings are substantial fireproof structures of concrete and brick. A vertical section through one of the buildings showing the arrangement of the wire tower, transformer switches and rotary converter is presented. The high-tension transmission line is looped into the wire tower of each intermediate substation, so that by means of oil switches the circuits may be opened on either side of the substation. Oil switches are also provided for cutting each substation from the transmission line. The electrical equipment in each includes one 300-kilowatt rotary converter, three 110-kilowatt single-phase oil-insulated transformers, with the necessary switchboard, high-potential remote-control oil switches and lightning arrester equipment; the apparatus all being used for the purpose of transforming the 33,000-volt alternating current to continuous current at 650 volts, at which potential it is fed directly to the low-tension feeder system. Each of the substation buildings is so designed and constructed that a duplicate equipment can be installed whenever the business of the railway shall require it. The buildings are fireproof and of ample size to accommodate the duplicate equipments referred to.

Shop and Car House.

A short distance from the power station a car shop has been constructed in which are placed all of the necessary woodworking and machine tools required to keep the company's property in repair. Adjacent to the shop a car house has been constructed of galvanized corrugated iron for protecting the rolling stock from the elements.



Ben-Hur Route—Passenger Equipment for Limited Service.

Rolling Stock.

The rolling stock for the new road consists of eight passenger cars and two baggage cars, which were built by the Jewett Car Company, Newark, O. Of the eight passenger cars six are designed for local service and two for limited service. The accompanying floor plan shows the seating arrangement and general dimensions of one of the limited cars.

Each of the passenger cars is 57 feet 8 inches long, 9 feet

2 inches wide, and 9 feet 9 inches high from under side of sills to top of roof, and with equipment weighs 41 tons. The underframing includes 7-inch 15-pound I-beam side sills with wood fillers. The intermediate sills are 1½ by 6 inch pine, reinforced from bolster to bumper with 6-inch 15½-pound I-beams. The center sills are 6-inch I-beams with wood fillers. Between the double floors is a 1½-inch space packed with mineral wool.

The baggage cars are 50 feet long over bumpers, 9 feet wide and 9 feet 6 inches high from under side of sills to top of roof. The underframing consists of two 6-inch I-beam center sills, filled; two 5 by 6-inch plain yellow pine intermediate sills, and two 5 by 8-inch yellow pine side sills reinforced with ½-inch steel plates placed on the outside.

The passenger cars for local service are divided into main, smoking and baggage compartments, while the limited cars have only two compartments, that for baggage being omitted. The limited cars seat 44 passengers in the main compartment and 16 in the smoking compartment. The local cars are provided with seats for 38 people in the main compartment and 16 in the smoking compartment, with the addition of temporary seats in the baggage room.

All car seats are Hale & Kilburn's stationary pattern No. 10 C. E., with single foot rest, mahogany arm rest, and spring edge cushions. The seats are 40 inches long with cushions 18 inches wide and backs 26 inches high. Seats in the main compartments are upholstered in plush, and those in the smoking compartment upholstered in leather.

The passenger cars are all finished in mahogany, with both interior and exterior art glass sashes arched over the windows. The floors are covered with inlaid linoleum, and in addition the limited cars have carpeted aisles and sheet rubber tiling on the floor of the toilet room and platforms.

Each car is provided with a toilet room, finished in white enamel and containing a Duner porcelain water flushed closet; the two limited cars are equipped with porcelain lavatories and plate glass mirrors.

The local cars are heated with Peter Smith hot water heaters and the limited cars with Consolidated electric heaters.

The car bodies are mounted on Baldwin Locomotive Works, M. C. B. type trucks with 7-foot wheel base and 37¼-inch rolled steel wheels. The electrical equipment of each car comprises four Allis-Chalmers-Bullock 75-horsepower railway motors with a gear ratio of 30:52 and Allis-Chalmers controllers. All of the power wiring is inclosed in steel conduit. The baggage cars have the same motor and truck equipment as the passenger cars, in order that all of the equipment shall be uniform and interchangeable. However, the baggage cars are equipped with combined straight and automatic air brakes of the Christensen type, whereas straight air brakes only are installed on the passenger cars.

The special equipment of these cars includes De France air sanders, Cronse-Hinds headlights, Lintern classification and signal lights, Van Dorn couplers and Wilson trolley retrievers.

Organization.

The cars are geared to operate at 60 miles per hour on straight and level track and now maintain a scheduled speed of 34 miles per hour in limited service and 25 miles per hour in local service.

The Indianapolis Crawfordsville & Western Traction Company was incorporated in 1903 under the laws of the state of Indiana as the Consolidated Traction Company. The name was changed as above in 1906. Capital stock authorized, $3,000,000; outstanding, $1,500,000; transfer agent, Marion Trust Company, Indianapolis. Bonded debt, $1,500,000 first gold 5s; dated May 21, 1906; due July 1, 1936; interest January and July at Van Norden Trust Company, New York City; Marion Trust Company, Indianapolis, trustee. Coupon, $1,000. Authorized, $3,000,000. Officers: A. A. Barnes, Indianapolis, president; Eli P. Baker, Crawfordsville, vice-president; Oliver P. Ensley, Indianapolis, treasurer; Edward Hawkins, Indianapolis, secretary. The property is controlled by a board of five managing trustees, consisting of Sterling R. Holt, Indianapolis, chairman; Edward Hawkins, Indianapolis, secretary; A. E. Reynolds and C. N. Van Cleave, Crawfordsville, Ind., and A. M. Hewes, Chicago.

The Moore-Mansfield Construction Company of Indianapolis carried out the contract for grading, construction of bridges, tracklaying and ballasting, and the Electrical Installation Company of Chicago acted as engineer and contractor for the complete construction and equipment of the power station, substations, shop, overhead trolley and transmission lines and rolling stock.

ACCOUNTING SYSTEM FOR ELECTRIC LIGHTING COMPANIES.

The report of a committee on a "Uniform System of Accounting for Electric Lighting Companies" was made to the National Electric Light Association at its meeting at Chicago during the present week. In its report the committee says:

The report of the committee on a "Uniform System of Accounting for Electric Light Companies," made to the association at its last meeting, was not adopted by the association, but the committee was continued. The sentiment of the meeting seemed to be that a condensation of the classification of expenses was desirable, and also that some attempt should be made to harmonize the system with that used by the American Street and Interurban Railway Association. Later the association authorized the committee to confer with similar committees of other bodies.

Since the last meeting of the association the public service commissions of New York have completed their organizations and have been preparing a classification of accounts. For the street railways the commissions have adopted the system of the interstate commerce commission, but for the gas and electric light industries they will formulate systems of their own. The accounting committee has kept in touch with this work of the commissions, has tendered its aid and this aid the commissions have been good enough to accept and have consulted the committee on all features of their plan. As the matter now stands both commissions have prepared tentative classification systems, have furnished the forms to the companies and have held public hearings thereon.

The tentative classification prepared by the commission for the first district covers property, income and operating accounts only, whereas the classification prepared by the commission for the second district covers the entire subject of accounting in all its phases.

There is one feature, common to all the recent federal and state legislation, establishing regulatory commissions, to which the accounting committee desires to call the attention of the association. It refers to the provisions forbidding the companies to keep any accounts, records or memoranda other than those prescribed by the commissions. If the purpose of this legislation is to prevent companies from making false reports to the commissions, it would seem to be unnecessary, as it is already unlawful to do so, and any company desiring to make improper reports would not be deterred by the new legislation from so doing. The principal effect would be to embarrass and annoy those companies that might desire information of one kind or another not asked for by the commissions, but which information, owing to local conditions, or even, if you please, to idiosyncrasies of the management, might make that information necessary to the proper administration of its affairs. Governmental accounts cannot be flexible, as they must be made to suit average conditions, nor can they quickly respond to exigencies which may arise locally. Every company occasionally makes special investigations to ascertain some particular cost or to determine the proper policy to pursue in some emergency. For such purposes special accounts are created, which are discontinued after the information sought has been obtained. The interstate commerce commission has recognized this condition.

The accounting committee feels that the association should endeavor to have this prohibitive feature of the legislation eliminated or so modified as will leave the companies at liberty to conduct their affairs according to their needs, and while giving to the governments the fullest information desired, shall equally give to the companies the information which they may require. Surely the interests of the public cannot be adversely affected by leaving to the owner of the property the right to at least inform himself of his own affairs in his own way.

REVISED CLASSIFICATION OF ACCOUNTS FOR ELECTRIC RAILWAYS.

At a conference held last week at the office of the interstate commerce commission, Washington, D. C., a revised classification of accounts of electric railways was prepared. Classifications of operating expenses, operating revenues and construction expenditures were drafted. Provision is made in the classification of operating expenses for three classes of companies, according to the plan of division of gross annual revenue, shown in the following. The text for the accounts is in course of preparation now, and it is proposed by the interstate commerce commission to have the accounts effective as of October 1, 1908.

Prof. H. C. Adams, in charge of statistics and accounts interstate commerce commission has sent the following letter to the various state commissions in the country, accompanied by a list of the proposed accounts:

Letter to State Commissions.

Referring to previous correspondence with this office relative to the adoption of a uniform system of accounting for electric railways I inclose herewith for your information a copy of the proposed classification of accounts, which has been carefully considered by the committees on "Classification" of the American Street and Interurban Railway Association and the American Street and Interurban Railway Accountants' Association, and, as I understand, in all essential particulars, meets with the approval of both these committees, one representing the operating and the other the accounting department of the electric railway corporations.

The text for these accounts will be prepared by a special committee of electric railway accountants which meets in Atlantic City today.

By referring to Accounting Series Circular No. 20, accompanying this letter, you will observe that the inclosed classification is a modification of the accounts appearing in that circular, and your especial attention is called to the following facts:

(1) The classification of operating expenses provides for three classes of roads, instead of two, as proposed in Circular No. 20, with 36 accounts for the smallest class, 58 accounts for the middle class and 88 accounts for the largest class.

(2) The primary accounts, "other operations—Dr." and "other operations—Cr." (Nos. 26, 27, 42, 43, 58, 59, 80 and 81) cover not only the proportion of production expenses caused by another co-ordinate department or departments within the same company (as electric light department, power department, heat department, etc.), but also the proportion of production expenses of jointly produced electric power.

(3) Provision is made for two depreciation accounts, one under maintenance of way and structures and one under maintenance of equipment. It is understood, however, that the order for the use of these accounts is to come from the state commissions and not from the interstate commission in all states where state commissions have jurisdiction over electric lines. In states where state commissions have not been given jurisdiction over electric lines it is probable that the order of the interstate commission relative to the use of depreciation accounts will conform to the action taken by a majority of the state commissions in other states.

In case a state having jurisdiction refrains from requiring that use be made of the depreciation accounts, an order should be issued definitely requiring the carrier to make use of appropriate repair accounts, detailed rules for which will be found in the text to be submitted hereafter.

In reports from interstate carriers to the interstate commission it is understood that, for the present, the order relative to the use of depreciation accounts of the commission of the state in which the major portion of the business of the corporation lies shall control.

(4) These accounts will be made effective by the interstate commerce commission on October 1, 1908, but it is the intention to have the text of classifications issued at the earliest possible date in order that state commissions may make same effective on July 1, 1908, if they so desire. The delay in promulgating the order of the interstate commerce commission is not to be interpreted as changing the date of the fiscal year, but as applicable only to the first year's reports and is adopted at the request of certain of the carriers.

These classifications have been prepared as far as possible in accordance with the wishes of the various state commissions and it is desired that this office be promptly advised of the action of your commision in regard to their adoption, and in case of such adoption the date on which they will be made effective.

You are also respectfully requested to advise this office as soon as convenient of the action of your commission regarding the depreciation accounts above referred to, it being our purpose to be guided in large measure by your action in this matter; but it is suggested that your commission need not delay an expression of its view upon the general question of the adoption of the classification of accounts until you have decided upon the advisability of the order relative to depreciation, that being a matter in no way contingent upon a general agreement with this office on the accounts as a whole.

CLASSIFICATION OF OPERATING EXPENSES OF ELECTRIC RAILWAYS.

Classes of Electric Railways.

Class.
A. Annual gross revenue..... $1,000,000 and over
B. Annual gross revenue..... $250,000 to $1,000,000
C. Annual gross revenue..... Under $250,000

41. Injuries and damages.
42. Taxes.
43. Miscellaneous.

American Society of Mechanical Engineers.

The semi-annual meeting of the American Society of Mechanical Engineers will be held in Detroit, Mich., June 23 to 26. An entire session will be devoted to papers on the conveying of materials, when hoisting and conveying machinery including belt conveyors, the use of conveying machinery in cement plants, etc., will be discussed.

Among other subjects which will be taken up by professional papers are : "Clutches," with special reference to automobile clutches, by Henry Souther; "Some Pitot Tube Studies," by Prof. W. B. Gregory of Tulane University, New Orleans, La., and Prof. E. W. Schroder of Cornell University; "Thermal Properties of Superheated Steam," by Prof. R. C. H. Hock of Lehigh University; "Horsepower, Friction Losses and Efficiencies of Gas and Oil Engines," by Prof. Lionel S. Marks of Harvard University; "A Journal Friction Measuring Machine," by Henry Hess of Philadelphia; "A Simple Method of Cleaning Gas Conduits," by W. D. Mount; "A Rational Method of Checking Conical Pistons for Stress," by Prof. G. H. Shepard of Syracuse University; and "The By-Product Coke Oven," by W. H. Blauvelt.

A lecture on "Contributions of Photography to Our Knowledge of Stellar Evolutions" will be delivered by Prof. John A. Brashear of Allegheny, Pa. The usual receptions will be held and excursions will be made to manufacturing plants, the ship building yards and various points of interest in and around Detroit. Among the excursions planned is one to the University of Michigan, at Ann Arbor. The gas power section of the society will hold a session, and the Society for the Promotion of Engineering Education and the Society of Automobile Engineers will hold meetings in Detroit at the same time. As far as possible, sessions will be arranged so that members interested in subjects treated by the other societies may attend their sessions without missing papers on related subjects read before their own society.

ADVERTISING THE ILLINOIS TRACTION SYSTEM.

The Illinois Traction System has issued striking new advertisements in the form of large timecards to advertise the limited and sleeper service between East St. Louis and Danville, Ill. A copy of the timecard, illustrated herewith, was received from B. R. Stephens, general traffic manager, Springfield, Ill.

The company has also circulated advertisements of the 15 limited trains which are now operated daily in each direction between Springfield and St. Louis. The latter advertisements are issued in the form of souvenir postcards and posters. They show end views of 15 St. Louis-Springfield limited cars. The cars leave the terminals every hour from 6 a. m. to 8 p. m., inclusive. The regular rate between St. Louis and Springfield is: One way, $2.00; round trip, $3.05. On Saturday and Sunday the excursion rate between East St. Louis and Springfield is $1.50 for the round trip.

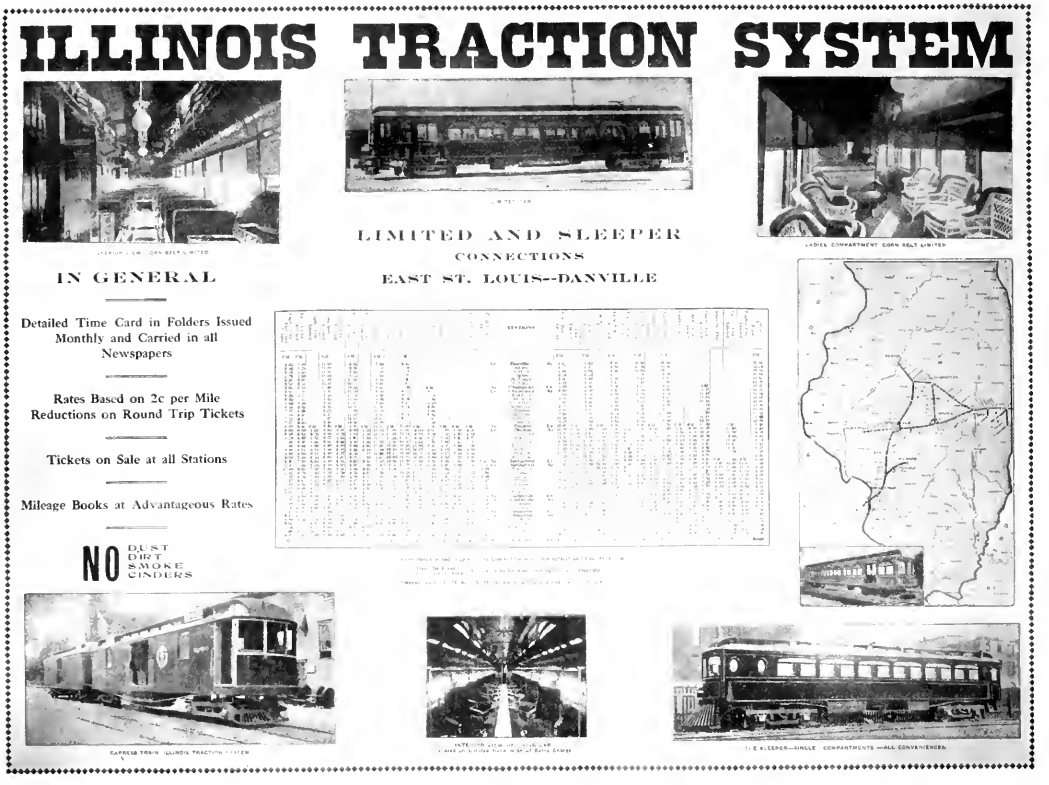
The Shoe and Leather Gazette of St. Louis publishes in its issue of May 6 an account of the experience of representatives of the paper who interviewed retail shoe merchants located on the lines of the Illinois Traction System. The Gazette states editorially that while it has taken a specific road as an illustration, the Illinois Traction System is only one of many throughout the country where swift and frequent passenger and freight electric cars have brought consumer and retailer and retailer and wholesaler in closer touch. The representatives of the paper interviewed merchants in Danville, Champaign, Mackinaw, Lincoln, Clinton, Urbana, Decatur, Peoria and Bloomington, Ill. The testimony of the retail merchants was very favorable to the use of electric cars. A specimen interview is that of G. C. Baldwin of the store of Gus M. Greenbaum, Danville, Ill. Mr. Baldwin states that he was obliged to wait six to eight days for freight from St. Louis over the steam roads last year, but that since the through interurban line was established orders may be sent to St. Louis one day and the supplies will be received the next day or in not less than two days.

In a discussion of the advantages afforded by the Illinois Traction System to the shippers in its territory the Gazette states:

The Illinois Traction System has been the means of overcoming a condition that has long been a detriment to St. Louis manufacturers. Freight to points east and north of St. Louis over steam roads required from five days to two weeks for delivery, while Chicago made it a point to deliver its goods in one or two days. The traction system has proved to be of inestimable value to the manufacturer in St. Louis and the retailers over the territory covered by the traction system. Shoes ordered in St. Louis today are delivered the following day. The dealer readily grasps this opportunity to buy in a market as important as St. Louis and with the millions of dollars' worth of shoes ready to ship he sees the advantage of small stock frequently sized up.

To ascertain the effect upon the towns the Gazette made a canvass of portions of the territory. Without exception the dealers were well pleased and were enthusiastic in statements revealing the benefits they had received. This, of course, was expected in the larger towns which naturally profit from the patronage of smaller neighbors, but strange to say, the small town has been improved in the same proportions that the larger one has experienced.

The Illinois Traction System has acted as a spur to all



Advertising the Illinois Traction System—Form of Large Timecard.

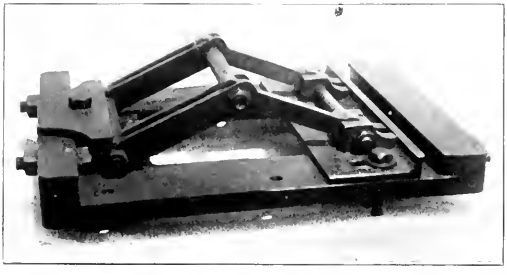
of its 86 towns, and the long stretches of country between. The people have become educated to buy more, see more, desire more and demand more, both necessities and luxuries. In fact, what were formerly considered luxuries are now necessities, and the demand for merchandise has increased to a wonderful extent.

PRACTICAL MOTOR COIL MAKING—NEW YORK CITY RAILWAY.

BY H. P. CLARK, MASTER MECHANIC.

"Shall electric railway companies make or buy their motor coils?" is a question often discussed. Aside from any consideration of profit it is the opinion of the writer that all the large electric railway companies should manufacture all the various coils required for their motors. Many of them do. The reason for this is explained when the factor of delivery is considered. The development of the electric industry has been so rapid that many roads have several types of motors in service. To carry in stock the large quantities of coils necessary for all the various types of motors would mean a very great outlay, with the result that frequently the coils most needed would not be available. Since several types of motors use similar wire the progressive shop manager may readily be prepared for the changing demands if he carries in stock a few kinds of wire and equips his shop with modern appliances for coil work.

In the shops of the New York City Railway Company some interesting methods are used for making coils. The different motors on this system range from the G.E. 800 to the latest type G.E. 210 with commutating poles. Reference to the accompanying illustrations will show how the work is done.

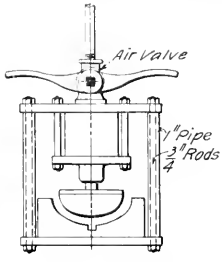


Coil Making—Clark Hot Press.

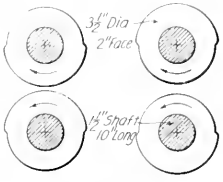
All machines of a certain type are built alike and placed symmetrically in the space allotted to the work. The reel stands are made of iron, securely fastened, thus giving strength to withstand high tension where needed. The stand as illustrated presents a neat appearance and at the same time reduces the fire hazard. Figure 1 shows the reel stand used for heavy work, such as G.E. 57 field coils. Figure 2 shows the details of the tension clamp. The same stand is used for wire field coils with the exception that the fiber is grooved wire field coils with the exception that the fiber is grooved for the wire and well greased with paraffin. These clamps work well and do not injure the insulation of the wire.

Figure 3 shows a stand for two reels as used for light work, such as making armature coils, etc. The same general design is used for all the stands.

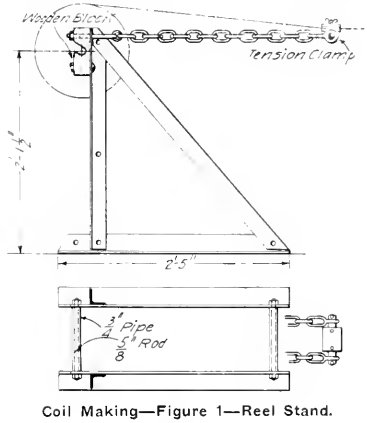
As the coils are gathered from the machines they are finished in the kind of hot press shown in the halftone engraving. About 45 seconds is required to press and dry the coils in one of these presses. Six presses are used and one boy can easily operate three of them. For making small coils, such as those for G.E. 1,000 motors, a press operated with compressed air is employed. This device, shown in Figure 4, is very simple and satisfactory. Air at 60 pounds pressure is used for forcing the piston down and a spiral spring inside the cylinder lifts it the instant the pressure is released. As the rod requires no packing the friction of the piston is slight.



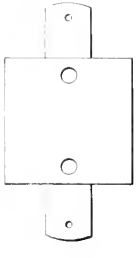
Coil Making—Figure 4.



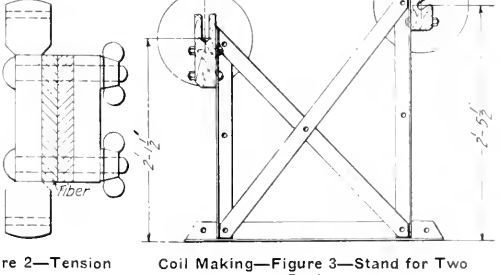
Coil Making—Figure 5—Flattening Rollers.



Coil Making—Figure 1—Reel Stand.



Coil Making—Figure 2—Tension Clamp.



Coil Making—Figure 3—Stand for Two Reels.

The G.E. 1,000 coil has flattened leads. The work of flattening is done by a pair of tool steel rolls, as shown in Figure 5. The rolls or discs are about 3½ inches in diameter with a 2-inch face and are keyed to two shafts. These shafts have a diameter of 1½ inches, are 10 inches long and are driven by suitable gearing with a ratio of 3 to 1. The coil is inserted in the clearance space and is forced out by the rolls. One roll is adjustable. The leads for coils can thus be flattened to any desired thickness and the cotton covering be removed at the same time. The cotton is removed from all

other coils by means of a wood cylinder covered with card cloth.

The devices shown in the accompanying sketches are simple affairs, built from time to time as opportunity offered. The average street railway shop has no elaborate toolroom or corps of experts available for designing or experimenting on improvements. In fact, the shop force generally is overtaxed with the regular routine work and the shop manager often hampered in his efforts to do the work satisfactorily with inadequate facilities. By taking advantage, however, of the opportunities that do come now and then, he will be able to provide at a comparatively low cost shop tools and equipments which will meet all ordinary requirements and find himself, like Diogenes of old, "prepared for anything that may happen."

NEW CARS FOR THE CHICAGO LAKE SHORE & SOUTH BEND RAILWAY.

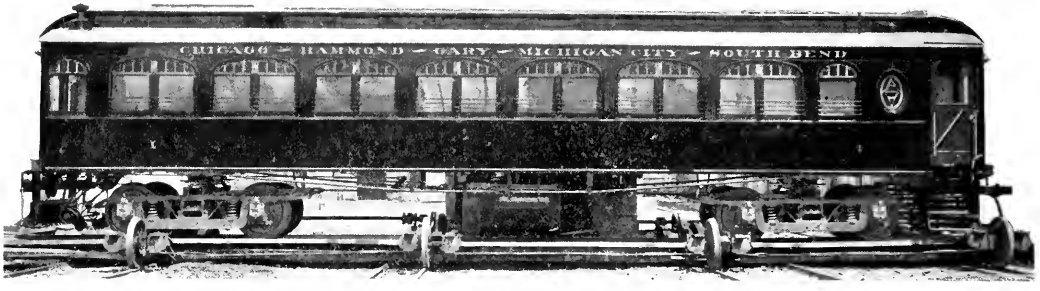
The Chicago Lake Shore & South Bend Railway Company is now receiving from the Niles Car & Manufacturing Company of Niles, O., 15 substantially built high-speed cars which are attractive in appearance.

The route of this new line was described and a map presented in the Electric Railway Review for May 2, 1908, page 542. The service which this new line will offer will be unique in character. An especially well-built roadbed, equipped for high-voltage single-phase operation, is nearly completed between South Bend, Ind., and Kensington, Ill., on the main line of the Illinois Central Railroad. An arrangement for joint service has been made between the electric road and the Illinois Central so that the electric cars, after traveling over the single-phase portion of the road on their own power, may be attached to regular trains of the Illinois Central road and hauled as trailers into the terminal station of the steam road at Chicago.

From the general dimensions presented it will be noted that the car bodies are of the regular steam coach width, which is a desirable feature that few interurban railways have been able to obtain. The initial order for these cars included 15 straight passenger coaches, eight combination passenger, smoker and baggage cars and one work car. The general dimensions are as follows:

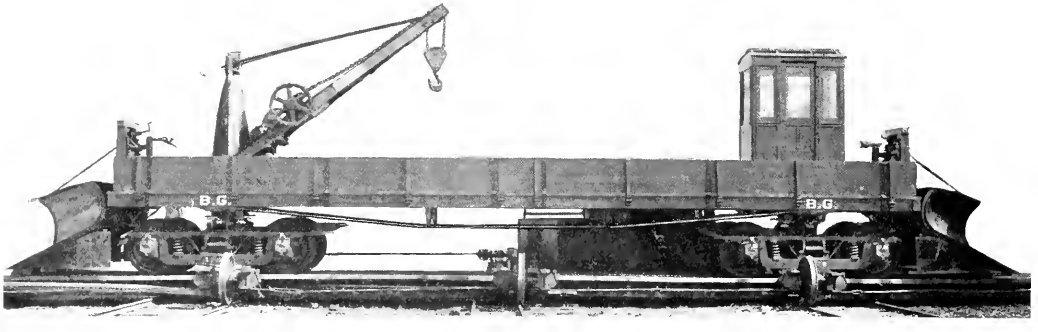
Length over all	57 ft. 2 in.
Length over body	47 ft. 4 in.
Width over all	10 ft.
Height from floor to top of roof	9 ft. 5 in.
Truck centers	35 ft. 6 in.
Width of aisle	24 in.
Width inside	9 ft. 7½ in.

This arrangement for terminal service with a steam trunk line requires that the electric cars conform to the rules of the Master Car Builders' Association as regards height of car, coupler, dimensions of wheel tread and flange, clearance, etc. As the suburban station platforms of the Illinois Central Railroad are elevated to the level of the steam coach floors it was necessary in building the electric cars to increase the height of the side vestibule doorways so that passengers may step from the station platform to the car platform.



High-Speed Interurban Car for the Chicago Lake Shore & South Bend Railway.

The bottom frames of the new cars are of semi-steel construction with double outside sills that have ⅝ by 10 inch steel plates bolted between them. The four center and intermediate sills are built of 6-inch I-beams and extend the full length of the car from buffer to buffer. The front ends of the cars are fitted with locomotive type pilots so arranged that they will not interfere with the drawbars and hose couplings when the cars are operated in trains. End doors are provided in the vestibules with spring buffers so that passengers may pass from car to car.



General Utility Car for the Chicago Lake Shore & South Bend Railway.

The interior of the car body is richly finished in polished dark mahogany. The window panels have the same curvature as the outside of the car and are set off with curved moldings. The main panels are bordered with a neat inlay of colored wood. The ceilings are full Empire style artistically decorated and illuminated with incandescent lamps inclosed in holophane bowls. An individual lamp is also supported over each seat by an artistic bronze bracket. The lower windows and doors are glazed with polished plate and the upper side sashes are glazed with tinted art glass set in copper frames. These Gothic sashes are double, with the interior section arranged to raise for cleaning. This window feature adds greatly to the interior appearance of the car as the curtains are arranged to roll into a neat casing at the bottom of the Gothic sashes similar to that used on Pullman cars. Bevel sash locks and bars with the necessary springs to prevent rattling, manufactured by the O. M. Edwards Company, are fitted to the window sashes. The curtains are of pantasote. Over the vestibule step openings are set self-opening traps, also manufactured by the O. M. Edwards Company.

The straight passenger cars have a seating capacity for 60 persons. The seats, manufactured by Hale & Kilburn, have stationary backs, foot rests, bronze grab and offset handles and arm rests and are upholstered in leather. The cushions are 38 inches long and the seats measure 48 inches from the inside of the car to the outside of the arm rests.

A toilet room is located at the rear of the main passenger compartment. This room has a combination hopper and is finished with a cement floor and white tiled walls. In the front bulkhead of the car is a high-tension switch cabinet lined with asbestos.

The new cars are mounted on Baldwin Locomotive Works Class 90-35 M. C. B. trucks with 7-foot 6-inch wheel base. Each truck was designed for a working center plate load of 35,000 pounds. Standard Steel Works steel wheels, 38 inches in diameter, are mounted on axles 6½ inches in diameter at the center, 7½ inches at the gear seat and 7 inches at the wheel seats. The journals are 5½ by 10 inches, inclosed in Symington journal boxes. Ball-bearing center bearings of Symington manufacture are used on all trucks.

The electrical equipment includes four Westinghouse No. 148 single-phase motors rated at 125 horsepower capacity each and multiple-unit control. The special equipment of the cars includes Peter Smith hot water heaters, Westinghouse automatic air brakes, Peacock hand brakes, Lintern markers and classification lights and Tomlinson couplers. As security against electrical injury the roof is covered with 16-ounce sheet copper well grounded. The exterior of the cars is painted in three shades of maroon with silver lettering. This exterior finish is similar to that of the Chicago & Alton limited trains.

The work car as illustrated is a combination equipment which can be used for construction, wrecking or fighting snow. The underframing is built of heavy steel with end-to-end sills 40 feet long. Sideboards are provided so that loose material may be carried. Mounted over one floor is a 10-foot pillar crane swinging in a 12-foot radius. This crane was built by the Cleveland Crane & Car Company, Cleveland, O. Both ends of the car may, if desired, be equipped with Russell wing plows designed to be raised or lowered by air controlled from the cab mounted over one of the trucks. The electrical and braking equipment is similar to that of the passenger cars.

The cars were designed by the Cleveland Construction Company, which has acted as engineer during the construction of the Chicago Lake Shore & South Bend Railway.

The Milwaukee Northern Railway expects to open its line to Sheboygan, Wis., probably in June. All grading through the swamps between Port Washington and Sheboygan has been completed and all right of way has been secured. Over six miles of track have been laid.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Anti-Pass Constitution Does Not Prevent Municipalities Giving or Contracting for Free Transportation for Policemen, Etc.

Oklahoma City v. Oklahoma Railway Company, 93 Pacific Reporter, 18.—The supreme court of Oklahoma holds that the provisions of Section 13 of Article IX of the constitution of that state, prohibiting the giving of free passes or transportation, etc., will not prohibit a municipal corporation operating a street railway from furnishing transportation free to its policemen and firemen and United States mail carriers, and half-rate tickets to school children, and free transportation to children under a certain age while traveling with a parent or guardian. Furthermore, municipalities are not prohibited by the provisions of said section of the constitution from granting franchises for street railways with conditions contained therein for the carrying of policemen, firemen, United States mail carriers and children under a certain age free, and for the furnishing of transportation to school children at a reduced fare, and when accepted by the grantee in the franchise are valid. Street railways undertaking and contracting with municipalities by provisions contained in franchises granted by such municipalities, to carry policemen, firemen, United States mail carriers and children under a certain age free, and also to carry school children at half the regular rate, are not absolved therefrom by Section 13, Article IX, of the constitution.

When Relation of Passenger Terminates—Passenger Carried Beyond Street and Injured Crossing Rough Track.

Melton v. Birmingham Railway Light & Power Company, 45 Southern Reporter, 151.—The supreme court of Alabama says that it thinks there can be no doubt of the soundness of the proposition that the relation of passenger does not terminate when the passenger leaves the car, but continues until he has reasonable opportunity to leave the car and roadway of the company, after the car reaches the station or stopping place to which he is entitled to be carried. This is the generally accepted doctrine.

Nor does the court think that it can be the subject of serious doubt that if the plaintiff, while traveling on one of the defendant's cars on a dark night, signaled the conductor to put her off at a particular street crossing (a regular stopping place), and the conductor understood the signal, but failed to put her off at that crossing, and put her off at a place beyond such crossing, where the company's track was ballasted with slag and was very rough, and that the plaintiff, while attempting to cross the track to go to her home, which was on the side of the track opposite the point where she alighted from the car, fell, and by the fall suffered the injury complained of, this would constitute actionable negligence, entitling the plaintiff to a recovery, unless she was guilty of contributory negligence in making her way across the track, or unless she assumed the risk.

Risk from Third Rail Assumed by Painters of Structure of Elevated Railroad.

James v. Cranford, 108 New York Supplement, 142.—The supreme court of New York, appellate division, second department, says that the plaintiff, one of 40 or 50 painters, was painting the iron columns and iron girders of the structure of an elevated railroad. The railroad at the time was being worked by power furnished by a third rail permanently placed along the rails. The plaintiff, in common with his fellows, was furnished with a paint brush, a duster and a swab. The swab was made of thin iron and was used to paint places which could not be painted with a brush. A place under and near the third rail required the application of the swab. The plaintiff

knelt and thrust his swab through a narrow space, holding the swab so that about three inches projected above his hand. He testified that he had no difficulty in putting the swab in, and that no part of it came in contact then with the third rail; but, when he was pulling the swab out, he brought one end of it in contact with the girder and the other end with the third rail simultaneously. The place itself was a risk assumed by the servant. And, in any event, as the evidence was clear that the plaintiff understood the peril if, in using this swab, he brought it into simultaneous contact with the third rail and the iron of the structure, the court thinks that he assumed the risk of using this swab in this place. His assumption of risk did not turn upon the extent of his knowledge when he began the work, or of his ignorance of the precise or exact result of such contact or of the fact that the result is technically known as a short-circuit. Probably to a man of his calling it would not have materially affected his work if he had known that such contact would produce a short-circuit, instead of being very dangerous. Surely he was not entitled to absolution because he did not precisely understand the scientific or physical fact resultant from contact or the electrical phenomenon resultant therefrom.

Reasonable Care Only is Required of Company as to Passenger on Running Board.

Gregory v. Elmira Water Light & Railroad Company, 83 Northeastern Reporter, 32.—The court of appeals of New York says that the plaintiff, with two companions, boarded an open car running north. All of the seats were occupied, as well as the standing room between the seats and in the aisle. The plaintiff and his companions were able to get upon the running board on the west side and, having done so, filled the place to its utmost capacity. It seemed to have been the practice of the defendant company to allow passengers to ride on the running boards if there was no room in the car. The space between the east rail of the west track and the west rail of the east track was 4 feet. The space in the clear between the two cars involved in this action was 22 inches. The plaintiff was knocked off from the running board, where he was standing, by a southbound closed car striking him on the left shoulder, though no other passenger upon that running board was interfered with in any way.

The trial judge instructed the jury, among other things, that it is the duty of the carrier to use every precaution that human skill and foresight can provide to secure the safety of its passengers. The court holds that, under the circumstances, this was erroneous. It says that there was no qualification of the measure of care which the jury could understand and apply to the case. In other words, the judge stated that the defendant rested under the duty of exercising the "utmost" care. The expression "such precaution as human skill and foresight could suggest" is synonymous with "utmost." The defendant rested only under the obligation to exercise ordinary care.

In this case there was no defect in the roadbed, the rolling stock or in the location of the tracks, 4 feet apart, and the operation of the cars, between which there was a space of 22 inches in the clear. As to the passenger in such a position, where there is no defect in the management or operation of the road save such dangers which are common from the peculiar position occupied by the passenger, the court is of the opinion that the measure of duty on behalf of the carrier is simply to use reasonable care to carry passengers safely under the circumstances. If the court were to apply the rule charged by the court below, that the company was bound to use such precaution as human foresight and skill could suggest—that is, "utmost" care—it would be practically to obliterate the rule that when a passenger voluntarily enters upon this dangerous position he assumes the ordinary risks in this respect. The court does not mean to relax the rule in any other respect except in such cases.

News of the Week

St. Louis Tax Ordinance Sustained.

The United States supreme court on May 18 rendered a decision sustaining the right of the city to levy a license tax of one mill per passenger on the street railways of St. Louis in accordance with the ordinance passed on March 25, 1903, as far as constitutional questions are concerned. The decision comes after four years of litigation in the district court at St. Louis, in which the city has twice been defeated in injunction suits brought to prevent the collection of the tax by the St. Louis Transit Company and its successor, the United Railways Company. In accordance with the decision the company will be obliged to pay the city about $850,000 in back taxes from January 1, 1904, to January 1, 1908, and an annual tax in the future amounting to about $220,000 on the basis of the present traffic. The ordinance replaced a former ordinance under which the city collected a license tax of $25 per car. It is stated that the company will apply for a rehearing in the supreme court or renew the case in the lower courts on points not involved in the present case.

Northwestern Elevated Extension Opened.

The new Evanston extension of the Northwestern Elevated Railroad, Chicago, was opened for regular operation on Saturday, May 16, when through trains were operated on a 10-minute headway from Central street, North Evanston, to the Union loop in Chicago. The first train to make the through trip was an inspection special carrying officials of the Northwestern Elevated Railroad and the Chicago Milwaukee & St. Paul Railway. The extension is over the right of way of the Chicago Milwaukee & St. Paul and connects with the elevated structure by an incline at Wilson avenue. Trains will be run every 10 minutes northbound from 7:08 a. m. to 11:58 p. m., and southbound from 6:20 a. m. to 11:40 p. m., and an hourly service will be operated at night. Cars will be run on an express schedule from Wilson avenue to the loop. The Evanston suburban service of the Chicago Milwaukee & St. Paul has been discontinued. The new cars used for the Evanston service were described and illustrated in the Electric Railway Review of April 25, 1908, page 500.

Strike in Cleveland.

The controversy between the officials of the Municipal Traction Company and its motormen and conductors, because of the company's refusal to abide by the agreement of the Cleveland Electric Railway to increase the wage scale two cents an hour, came to a crisis on Friday night, when the men voted to declare a strike effective at 5 a. m. on Saturday morning. Since that time the street cars in Cleveland have been running irregularly, manned by non-union men, and the city has been the scene of numerous riots, in which many persons have been injured and several cars have been wrecked.

As reported in last week's issue E. S. Meyer and S. H. Tolles were appointed on Tuesday, May 12, as arbitrators to settle the points of difference. These men were to select a third arbitrator. Mr. Tolles, the company's representative, was out of the city and would not return until Friday. In the meantime the officials of the company continued to discharge old employes of the Cleveland Electric Railway on charges of dishonesty or breach of discipline and to fill their places with non-union men. Angered by these tactics and by what they termed the dilatory attitude of the company toward the arbitration, because Mr. Tolles had not been notified of his appointment, the officers of the union on Thursday sent a letter to Mr. du Pont demanding that no more men be discharged or placed on the extra list and that conditions existing prior to April 27 be maintained pending the decision of the arbitrators. Mr. du Pont refused and on Friday night the strike meeting was held.

The old Forest City employes, who were not affected by the Cleveland Electric agreement, refused to strike, and these, together with others who refused to strike and the non-union men employed within the past few days, furnished sufficient men to operate the cars on an irregular schedule during the day. Little attempt has been made all week to operate cars at night. Many riots occurred in all parts of the city on Saturday and Sunday and the operation of the cars was hindered in every possible way by the strikers and their sympathizers. Feed wires were cut, obstructions were placed on the tracks and the men operating the cars were assaulted and dragged from the cars. Policemen were stationed on every car during the evening and wire screens were placed across the front of the platform to protect the motormen. Three cars were wrecked on Sunday and conflicts between the police and the

strikers were numerous. On Monday and Tuesday disturbances became more frequent. Several cars were wrecked with dynamite, injuring many of the passengers, and several men were shot during attacks on the cars by the rioters.

Interurban cars were allowed to enter the city unmolested, but not to receive passengers within the city limits. Very few passengers were carried by any of the cars on account of the danger of attack, and although bus lines have been established, most of the people have had to walk. The steam roads increased their suburban service and handled large numbers of people who have ordinarily used the street cars.

The state board of arbitration has been active from the start in attempting to bring about a settlement of the strike by arbitration and several conferences have been held with representatives of the union and of the company. Mr. du Pont refused to talk arbitration until the rioting was stopped. Conditions were better on Wednesday and both sides agreed to arbitrate. The principal point of difficulty has been in regard to the terms of reinstatement of the strikers. Mr. du Pont agreed to take all of the men back, but as new men, thereby giving preference in the matter of runs to the non-union men who have been employed recently. The union men insisted on being restored to their old runs. On Wednesday night it was believed that a settlement would be reached within a few hours.

Decision of Arbitrators on Pittsburg Wage Reduction.

The arbitrators appointed to settle the controversy between the Pittsburg Railways Company and its conductors and motormen announced a decision on May 14, by which the company is authorized to reduce wages one-half cent per hour, dating from May 9, 1908, to April 30, 1909. The present scale is 25, 26 and 27 cents per hour, according to length of service, which represents an increase of 33⅓ per cent since January 1, 1902. On May 1 the company proposed to reduce wages one cent an hour on the grounds that its earnings had been decreased by the general business depression. After a controversy the question was left to an arbitration committee composed of M. K. McMullin, representing the company; Calvin Wyatt, representing the employes, and Judge J. J. Miller, chosen by the first two. The decision of the committee is as follows:

"The majority of arbitrators after a careful consideration of all the evidence, having especially in view the fact that in the last five months there has been a deficit of $292,549 in car fares, compared with the five months of the year previous; that the wages of conductors and motormen were raised two cents per hour one year ago based on the prosperous condition then existing; that the reduction in the number of cars in present operation, and consequent decrease in the amount of wages paid, does not decrease the expenses of operation in proportion to the deficit; believing further that the exorbitant cost of living at present is on a fictitious basis and will decrease before the present business conditions obtain their standing of a year ago, we are of the opinion that in all fairness some modification should be made in the demand of both sides. We therefore split the difference of contention into one-half and fix the rate of reduction at one-half cent per hour. This to control from May 9, 1908, to April 30, 1909."

Settlement of Chicago Labor Controversy.

The threatened strike of the motormen and conductors employed by the Chicago Railways Company because the company refused to discharge 20 men who had resigned from the union, was averted on Thursday of this week when the 20 men who had caused the trouble returned to the union and paid their dues, after having failed to secure an injunction restraining the union from striking. As reported in last week's issue the men voted an May 10 by a large majority to strike unless the company enforced the "closed shop" principle. Eight of the former union members immediately applied for an injunction to restrain the union from threatening a strike in the effort to force their discharge. The union filed a demurrer and the case was heard on Tuesday of this week before Judge Walker of the Cook county circuit court, who denied the petition for an injuction.

The court said that the union has already voted to strike and that no threats of violence or other intimidation have been made, and that while the plaintiffs are guaranteed by the constitution the personal liberty to dispose of their labor as they see fit, yet the defendants have the same right and the right to refuse to work. Having this right and choosing to exercise it, it would be absurd to claim that they may not present to the company their reason for doing so. If an injunction such as this could be sustained any two or three men in a union, whether having joined from good motives or bad, could obtain an injunction restraining the rest of the union from quitting work.

Representatives of the union held a conference with President Roach on Wednesday and asked for the discharge of the 20 men. It was finally decided to submit the question to the executive committee of the board of directors on Monday. On Thursday the men who had withdrawn from the union secured reinstatement and the controversy was ended.

Transit Affairs in New York.

The New York public service commission of the first district held a hearing on May 13 in regard to the recommendations of Bion J. Arnold of Chicago that the subway cars be provided with two additional side doors at each end, which were included in an exhaustive report submitted to the commission in February. [An abstract of the report was published in the Electric Railway Review of February 29, 1908, page 262.] Frank Hedley, general manager of the Interborough Rapid Transit Company, and Mr. Arnold were the principal witnesses. Mr. Hedley agreed with Mr. Arnold that the cost of transforming a steel car would be about $2,000, but thought that the cost of changing the wooden cars would be about $2,200, instead of $1,800, as estimated by Mr. Arnold. He thought that the result would be an unsatisfactory piece of work and that the increase of weight, 3,300 pounds for wooden or composite cars and 1,200 for steel cars, would make operation more costly and less speedy. Mr. Hedley also had doubts as to whether the New York public would take readily to the plan and said that the present type of cars was best suited for the present conditions of the subway, on account of the curved platforms.

The appellate division of the supreme court on May 15 granted the public service commission an order extending for three years from October 15, 1908, the time in which the construction of several subway routes in Manhattan may be started under the original authorization given to the old rapid transit commission. The routes referred to are the Third avenue, Seventh and Eighth avenues, Lexington avenue, White Plains, Jerome avenue, Girard avenue, Thirty-fourth street and Fourteenth street routes.

Representatives of a large number of civic organizations of Staten Island appeared before the public service commission on May 15 to urge that the plans for the Fourth avenue subway be modified so that the route may be extended under the Narrows to Staten Island.

The new subway terminal station for trolley cars at the Manhattan end of the Williamsburg bridge was opened on May 19 for regular service. Hitherto the cars crossing the bridge from the Brooklyn side have been run into a series of surface switches, and in the rush hours there has been congestion and confusion. Now the cars will be run into a subway terminal station which has been equipped with eight loops. Separate platforms, entrances and exists have been built for each loop. The incoming and outgoing passengers will be separated, and confusion in the loading and unloading of cars will thus be avoided. It is expected that elevated trains will be operated across the bridge by July 1.

William Bradley, the contractor for the section of the Brooklyn bridge loop subway just north of the Brooklyn bridge, has been ordered by the public service commission to discontinue all work except excavation until the detailed plans for the new Municipal building are completed.

Samuel Rea, third vice-president of the Pennsylvania Railroad, has written a letter to Comptroller Metz supporting the contention of John B. McDonald that there is no need for the proposed Broadway-Lexington avenue subway and urging that the requirements of the city at the present time would be better met by the construction of a branch of the present subway from Forty-second street south under Seventh avenue, serving the Pennsylvania and Long Island railroad terminals.

Comptroller Metz presented to the board of estimate on May 16 a report on the city's financial condition which shows that the total borrowing capacity of the city at present under the constitutional debt limitation, based on 10 per cent of the assessed valuation, is only $1,443,725, so that no subway contracts can be let until after July 1, when the debt limit will be increased by the increased valuation of real estate.

Machinery Club of New York.—The Machinery Club of New York formally opened the club rooms, which occupy the twenty-first and twenty-second floors of the Fulton Terminal building at 50 Church street, New York, on the afternoon of Thursday, May 21.

Consolidation Bill Reported.—The committee on street railways of the Massachusetts senate has reported a bill authorizing the purchase of the Bennington & North Adams Street Railway of Hoosic Falls, N. Y., by the Berkshire Street Railway of Pittsfield Mass.

Railroad Club of New York.—On May 18 the rooms of the Railroad Club of New York, on the twenty-first and twenty-second floors of the Cortlandt street building of the Hudson Terminals, were formally opened. The officers of the club are: E. H. Gary, president; F. D. Underwood, vice-president; C. W.

King, secretary and treasurer. On the house committee are: W. G. McAdoo, W. G. Oakman, W. H. Marshall, F. B. Jennings and W. G. Besler. The board of governors includes William H. Barnum, Anthony N. Brady, C. A. Coffin, E. C. Converse, R. W. De Forest, Fliny Fisk, Clarence H. Kelsey, George R. Sheldon and Cornelius Vanderbilt.

Brotherhood of Locomotive Engineers Admits Motormen.—At the annual convention of the Brotherhood of Locomotive Engineers, held in Columbus, it was voted to admit to membership the motormen operating electrically drawn trains on steam railways. It was also voted that engineers in Cuba be admitted to the brotherhood.

American Institute of Electrical Engineers, Chicago Section.—It is announced that a meeting of the Chicago Section of the American Institute of Electrical Engineers will be held in the rooms of the Western Society of Engineers in the Monadnock block on Friday evening, May 22. The paper of the evening will be "Water Power Development of Michigan," by F. E. Greenman of Grand Rapids, Mich.

Suit to Enjoin Operation of Interurban Cars in Milwaukee.—Residents of Wells street, Milwaukee, Wis., have filed a suit in the circuit court asking an injunction restraining the Milwaukee Light Heat & Traction Company from operating interurban cars over the tracks of the Milwaukee Electric Railway & Light Company on that street, claiming that the company has no franchise for the operation of interurban cars.

Car Cleaning Order in McKeesport.—The board of health of McKeesport, Pa., has notified the Highland Grove Traction Company, the Pittsburg Railways Company and the West Penn Railways Company, the three companies operating in McKeesport, that hereafter they will be required to comply with a new regulation of the board that all cars must be dusted and cleaned with a damp cloth daily and must be fumigated and washed with soap and hot water weekly.

Ottawa Employes Ask Wage Arbitration.—The motormen and conductors of the Ottawa (Ont.) Electric Railway have applied to the department of labor for an arbitration of their demand for an increase of wages, which has been refused by the company. The men are asking for 22 cents an hour for the first year's service and 23 cents an hour thereafter, with an additional 2 cents an hour for Sunday work. The present scale is 17½, 18½ and 19½ cents an hour, according to length of service, with 2 cents additional on Sunday.

Strike in Wilmington, Del.—Employes of the Wilmington City Railway, who have recently organized a branch of the Amalgamated Association of Street and Electric Railway Employes, declared a strike on May 17 because the company refused to reinstate five conductors and motormen who were discharged when they became officers of the new union. The company was able to maintain its schedule on Sunday, but the strikers have made preparations for a boycott and several scenes of disorder have resulted. It is stated that the underlying cause of the strike is the reduction of wages from 18½ to 16⅔ cents an hour, which went into effect on April 1.

Accidents in New York.—According to the reports compiled by the New York public service commission of the first district, there were in April 4,707 accidents upon the street railways, subways and elevated roads within its jurisdiction. This shows a steady increase since the beginning of the year. In January there were 3,921 accidents, in February 3,951 and in March 4,353. The accidents specified in April were 138 car collisions, 929 persons and vehicles struck by cars, 562 persons injured while boarding cars, and 544 while alighting. Contact with electric rails or wires accounted for 36 accidents. Altogether there were 2,836 persons injured. Of these, 1,671 were passengers, 662 persons not passengers and 503 employes. These figures also show an increase. Of the persons injured in April, 30 died.

New England Street Railway Club.—The regular monthly meeting of the New England Street Railway Club will be held in the Electrical Engineering building of the Worcester Polytechnic Institute, Worcester, Mass., on Tuesday evening, May 26. On invitation of the Worcester Polytechnic Institute, the members of the club will be given an opportunity to inspect the new laboratory building and equipment, particularly that portion which is devoted to railway work. Some experimental demonstrations of high-voltage apparatus will be given. Previous to the inspection of the laboratory building the club will be favored with an address by Albert S. Richey, professor of electric railway engineering. Through the courtesy of the Boston Elevated Railway, the Boston & Worcester Street Railway and the Worcester Consolidated Street Railway, the party will be taken from Boston to Worcester and return. Special cars will be provided by the Boston & Worcester Street Railway.

Traffic and Transportation

Commission's Order Provides Excessive Number of Seats.

At a hearing before Commissioner Maltbie of the New York public service commission, first district, some of the inspectors of the commission reported that the order issued some time ago calling for a stated increase in the number of cars run on the Eighth avenue line had been obeyed, and that, as a consequence, there were in operation on Sundays, rainy days, and other times when the traffic was light, more cars than were necessary to provide a seat for every passenger.

The subject of the service in this line will be reopened, and it is probable that a more elastic order will be issued.

Orders of the New York Public Service Commission, Second District.

The New York public service commission, second district, announces that it has ordered the Black River Traction Company, Watertown, N. Y., to put in force by June 1 a rate of fare not to exceed five cents per passenger for transportation from Watertown to Glen Park. The new rate is to continue for at least three years, with leave to the company or any person interested to apply for a modification at any time. The company has been charging a 10-cent fare.

The commission has ordered the Port Jervis (N. Y.) Electric Light Power Gas & Railroad Company to repair its equipment and supply appliances to secure reasonably the safety and comfort of passengers on its lines. The repairs, changes and improvements are to be completed, subject to the approval of the commission, within three months. The company is required to present within 20 days its plans and specifications for the improvements.

Further Discontinuance of Transfers in New York.

Judge Lacombe of the United States circuit court, New York, heard arguments on May 15 on the petition of Frederick W. Whitridge, as receiver of the Union Railway Company, to abolish the transfer system in operation between the Union road, the Yonkers Railroad and the Westchester Electric Railroad. The reason given for this, besides the unprofitableness, the lines of each company.

The petition states that the Union Railway Company is under no contract or obligation to exchange transfers with the other two roads and that to continue to do so is inimical to its interests. "The abolition of the transfers may cause considerable public inconvenience," the petition says, "but the public has the power to avoid it."

In pursuance of the plan to discontinue the present transfer system it is found necessary to discontinue certain joint operations now carried on between the three roads.

The petition states further that it is proposed to discontinue the sale of transfer tickets with the Manhattan Elevated road. The reason given for this, besides the unprofitableness, is the opportunity such transfers give for fraud in the purchase and sale of transfers by individuals.

Judge Lacombe was inclined to sympathize with the efforts of Mr. Whitridge to do away with transfer abuses, and he told of a trip he took from Third avenue and One Hundred and Twenty-ninth street by transfer to Mount Vernon, thence to Yonkers by transfer, and back to Williamsbridge still on a transfer—a ride of more than 18 miles for five cents.

Union Elevated Loop Decision.

In a decision in connection with the suit brought by the Metropolitan West Side Elevated Railway of Chicago against the Northwestern Elevated Railroad, Judge Carpenter of the Cook county circuit court said concerning the lease between the owner and lessee companies of the Union Elevated loop:

"I am satisfied that the document is a lease and contains an express covenant on the part of the operating railroads. And so long as the proportion of cars on the loop to be operated by one of the companies depends on the facts shown by the monthly reports of each, it is difficult to see what the board of managers, as arbitrators, have to do with that proportion.

"The construction of the loop was a great burden on the rights of the people. It interferes with traffic; it destroys the light in offices and stores along the right of way; the noise and rumbling of the cars are a great nuisance. In the interest of the public, however, all these must be borne, the evil consequences having been reduced to a minimum by the city council requiring all the companies to operate on this single loop."

The court sustained the position of the Metropolitan road in holding that "while no complaint is made that the board of managers, as at present constituted, is disqualified to undertake the administrative work of the loop property, as between

the Northwestern road as lessor and any one of the operative companies, the president of the Northwestern road is not a proper member of the board of managers."

The effect of the decision is to refer the original question concerning the proportion of the loop service to be allowed each company for a further hearing.

Impossibility of Maintaining Schedules at Charlestown, Mass.

The Massachusetts railroad commission has made a reply to the petition of the Charlestown Improvement Association for additional service on surface lines of the Boston Elevated Railway in Charlestown. An abstract of the reply follows:

"By reason of the frequent opening of the draw span of the Charlestown bridge, the operation of trains at grade at the crossing of the Boston & Maine Railroad near Sullivan square, and congested highway traffic at the 'rush hours' on Main street, delays in surface-car operation are unavoidable. The unsatisfactory conditions are not due to an insufficient number of cars, but the impossibility under present physical conditions of maintaining schedules.

"The installation of an additional line would tend, in the opinion of the board, to further congest the traffic. The surface car traffic tables furnished by the company are convincing upon this point. A so-called belt line, if installed, might possibly be operated without being subject to bridge and grade crossing delays, but in order so to do, cars on the belt line would be obliged, near City and Sullivan squares, to make a crossover against traffic, reversing trolley poles and stalling cars. To undertake to do this at points as congested as these are with frequent car service and heavy teaming, would further disarrange existing schedules. The only feasible way by which a belt line, properly so termed, could be successfully operated would be by the acquisition of new locations by the company near City and Sullivan squares, involving grants of location and the construction of special work for trackage.

"The board is unable to recommend this action to the company, in view of the situation as a whole, and especially in view of the service as at present rendered.

"It is hoped that the completion of the Washington street subway with a consequent rearrangement of operation may relieve the situation. In the meantime the board will exercise a careful oversight of conditions within the Charlestown district, and recommends to the company that earnest endeavor be constantly made to minimize, so far as possible, surface car delays in that area; but it must be realized that physical conditions now cause many unavoidable delays, for which neither the residents of Charlestown nor the company are primarily responsible."

Appeal Against Philadelphia Transfer Change.—The United Business Men's Association of Philadelphia will appeal to city councils against the decision of the Philadelphia Rapid Transit Company to requre a cash fare for every transfer.

Steam Lines Withhold Facilities from Winona Road.—H. S. Dickey, general superintendent of the Winona Interurban Railway, Winona Lake, Ind., has filed petitions with the Indiana railroad commission asking that the commission compel the Cleveland Cincinnati Chicago & St. Louis Railway and the Pittsburg Ft. Wayne & Chicago Railway to interchange traffic with the Winona Interurban road. Mr. Dickey states that the two steam roads have entered into an agreement not to exchange business with the Winona road. He says that the Cleveland Cincinnati Chicago & St. Louis road has served notice that it will refuse to deliver any cars to the Winona company to be switched to industries on the Winona line. The Pittsburg Ft. Wayne & Chicago road, Mr. Dickey says, has refused to deliver cars to the connecting tracks between the railroad and the interurban line at Winona Lake.

Through Trips Between Chicago and Indianapolis.—The Indiana Union Traction Company, Anderson, Ind., has completed arrangements with the Chicago Cincinnati & Louisville Railroad to sell through tickets between Chicago and Indianapolis. Arrangements have been made for two connections daily in each direction. Trains of the Indiana Union Traction Company will leave Indianapolis at 11:30 a. m. and 11:30 p. m., running as through special trains to Peru. Connection will be made with the steam road at Peru. Passengers on the electric cars will have a convenient method of transfer, as the tracks of the steam and electric lines will adjoin. For the night run to Chicago a sleeper will be on the track at Peru and can be occupied after 9 o'clock if travelers desire to leave Indianapolis on an earlier traction train than the one which makes close connection. The rate for a berth will be $1.00 less than the regular berth rate on through steam roads from Indianapolis. F. D. Norviel, general passenger and freight agent of the Indiana Union Traction Company, who has completed the arrangements for the through trips between Indianapolis and Chicago, announces that similar through service is in process of arrangement with the Wabash Railroad and the Toledo St. Louis & Western Railroad.

Construction News

FRANCHISES.

Ballston Spa, N. Y.—The Schenectady Railway Company has secured permission from the board of trustees to lay tracks across Bath street.

Brooklyn, N. Y.—The Brooklyn Rapid Transit Company has applied to the board of estimate for a franchise to lay tracks on the triangle at Flatbush, Fourth and Atlantic avenues where the Long Island Railroad station and subway terminal are located.

Cheyenne, Wyo.—It is stated that S. G. Griffin and Daniel Hewitt of Colorado Springs, Colo., the latter president of the Interstate Railway & Improvement Company, will make application for a franchise to build a 5-mile electric line through Cheyenne and on to Ft. Russell. The franchise also calls for electric lighting. It is intended to complete the line by August of this year.

Colorado Springs, Colo.—Henry J. Arnold of this city, representing western capitalists, has applied to the city council for a franchise to build an electric line from the Chicago Milwaukee & St. Paul station west to Excelsior Springs, one mile. This line will care for the increasing summer tourist travel from Colorado Springs to Excelsior Springs, which heretofore has been served only by bus lines.

Elk Lick, Pa.—The Pennsylvania & Maryland Street Railway Company has filed notice of an extension of route from Broadway and Grant street, Meyersdale, to Garrett, and about 1,000 feet beyond Garrett to a connection with an existing line of the company. C. H. Jennings, Jennings, Md., is president.

La Crosse, Wis.—The La Crosse City Railway Company has asked for an extension of one year's time in which to complete the proposed extension of the Market street line. Under the former franchise the work was to be completed in 1908 under penalty of $1,000.

RECENT INCORPORATIONS.

Arizona Southern Railway.—Incorporated under the laws of Minnesota to build a steam or electric railroad in Arizona. Capital stock, $50,000. Incorporators: Cleve Van Dyke, Warren, Ariz.; T. A. England, Alexandria, Minn.; Arthur A. Van Dyke, St. Paul, Minn.

Geneva Railway Securities Company.—Incorporated as a holding company to take over the securities held by the Geneva Waterloo Seneca Falls & Cayuga Lake Traction Company, which operates a 17½-mile interurban line connecting the towns named. Capital stock, $567,000. Incorporators: Walter G. Merritt, New York; David B. Henney, Hartford, Conn.; James A. McNelus, Brooklyn, N. Y.

Oklahoma El Reno & Shawnee Rapid Transit Company.—Incorporated in Oklahoma to construct a line from El Reno to Shawnee by way of Oklahoma City at an estimated cost of $20,000 per mile. Capital stock, $1,500,000. Incorporators: A. Huber, J. A. Niblo, W. M. Sawyer, S. L. Niblo, Oklahoma City; Charles E. Davis, Lugert, Okla.

Rapid Transit Company, Yazoo City, Miss.—Incorporated in Mississippi with a capital stock of $10,000. Incorporators: T. F. Davis, W. A. Henry, Jr., and others.

Vicksburg Traction Company, Vicksburg, Miss.—Incorporated in Mississippi to operate an electric railway in Vicksburg. Capital stock, $10,000. Incorporators: S. S. Bullis, J. W. Cassell, and others of Vicksburg, Miss.

TRACK AND ROADWAY.

Ardmore Street Railway, Pittsburg, Pa.—It is announced that this company's double-track line from Wilkinsburg to the Westinghouse works at East Pittsburg, Pa., will be opened about June 1. The car house and power plant are located in about the middle of the line. Power will be furnished for lighting. William Flinn is president and H. P. Haas, vice-president.

Boise Valley Railway, Boise, Idaho.—It is reported that construction has been started on an extension of the Boise-Nampa line to Meridian, Idaho. (Noted February 8.)

Burlington-Bonaparte Interurban Railway, Burlington, Ia.—E. E. Egan, secretary, is now engaged in making right of way contracts and adjusting preliminary details for the proposed line from Burlington to Bonaparte, Ia., 40 miles. Surveys have been completed by the Wallace-Coates Engineering Company, Chicago. (Noted February 8.)

Burlington Interurban Railroad.—This company has been organized to build an electric railway from Hudson to Greeley, Colo. Fred Olson of St. Paul, Minn., and J. Fletcher, John Clug and Ray Watson of Eaton, Colo., are interested.

Denver (Colo.) City Tramway.—On May 15 this company began operating over 10 miles of new city tracks, which makes a total of 22 miles constructed under the franchise granted on May 15, 1906. The new lines are as follows: From Sixteenth and Arapahoe streets to the city limits at Globeville, where connection will be made with the Denver & Interurban Railway; an extension of the West Forty-fourth avenue line from Gallup avenue to Lakeside; on Eighteenth street from the Union depot to Welton street.

Edgefield & Augusta Electric Railway, Edgefield, S. C.—This company is being organized to build an electric railway from Edgefield to Augusta, Ga., and a committee has been appointed to solicit stock subscriptions.

Illinois Traction Company, Champaign, Ill.—President W. B. McKinley has received from the United States war department a letter stating that the company will not be required to make any changes in its plans for the bridge across the Mississippi river. Since the plans were approved at a hearing on June 20, 1907, several protests have been made against the plans on the grounds that the bridge would obstruct navigation. The engineers of the war department have investigated the matter and report the objections unfounded.

Indianapolis & South Bend Traction Company, Indianapolis, Ind.—It is planned to begin grading in a few days on the line from Logansport to Burlington, Ind., 20 miles. Surveys are now being made. It is hoped to complete the line from Logansport as far as Frankfort this year. J. Shafer, chief engineer. (Noted April 4.)

Kansas City & Bonner Springs Railway, Kansas City, Mo.—This company has begun operating cars from Bonner Springs to the Bonner Portland Cement Company plant, about 1½ miles, and will soon operate over an extension to Forest Lake. The line connects with the Metropolitan Street Railway at Eighteenth street and Minnesota avenue in Kansas City, Kan. Park Williamson of Edwardsville, Kan., is chief engineer.

Kansas-Colorado Power & Railroad Company.—A meeting of about 400 delegates from towns on the Arkansas river, Colorado, was held at La Junta, Colo. on May 14 to hear a proposition made by A. B. Hulit, representing the Northern Electrical Manufacturing Company of Madison, Wis., relative to the organization of a con pany to build power plants, transmission lines and an electric railroad from Canyon City, Colo., to Dodge City and Scott City, Kan., connecting the principal towns in the Arkansas Valley. A committee of 13 was appointed to perfect the organization and incorporation of the Kansas-Colorado Power & Railroad Company, with a capital stock of $3,500,000, to be increased later to $15,000,000. It is proposed to build a large power plant on the Arkansas river near Canyon City to be used in connection with an extensive irrigation system, and to provide power for commercial purposes. The Northern Electrical Manufacturing Company proposes to do the preliminary work, and make surveys and estimates and to contract for the construction of the power plant, transmission lines and railroad for mortgages on land in the territory covered by the project. The committee is as follows: Alva Adams, Pueblo; Andrew McClellan, Pueblo; S. H. Atwater, Canyon City; F. D. Pastorius, Colorado Springs; J. N. Beaty, Manzanola; J. A. Lockhart, Rocky Ford; Robert W. Patterson, La Junta; Donald McIntosh, Las Animas; W. C. Gould, Lamar; A. H. Warner, Garden City, Kan.; Fred Humphreys, Syracuse, Kan.; W. O. Bourne, Scott City, Kan., and Andrew Russell, Dodge City, Kan.

Marquette Negaunee & Ishpeming Interurban Railway, Marquette, Mich.—J. W. Barber, secretary, writes that contracts will be let this month for grading the line from Marquette to Negunee, Mich., 14 miles. Charles Cumming is chief engineer. (Noted May 9.)

Milwaukee & Fox River Valley Railroad, Fond du Lac, Wis.—The Wisconsin railroad commission held a hearing last week on the application of this company for a certificate granting permission for the construction of the proposed line from Appleton, Kaukauna and Fond du Lac, via Chilton, Plymouth and Cedarburg to Milwaukee, Wis. The application was opposed by the Milwaukee Electric Railway & Light Company and the Milwaukee Northern Railway. The latter company objects to the line from Cedarburg to Milwaukee. J. M. Saemann of Sheboygan is president. (Noted May 9.)

Minnesota Construction Company, Minneapolis, Minn.—This company has been organized, with a capital stock of $100,000, to build an electric railway from Minneapolis to Medicine Lake, Minn., which is to extended later to Montevideo, via Wayzata, Long Lake, Stubbs Bay and Winsted. It is proposed to build the line in 6-mile sections and right of way has been obtained for the first section. Officers: President, John Blichfeldt; vice-president, Major Lonstaff; secretary and treasurer, W. W. Bardwell.

Nashville Interurban Railway, Nashville, Tenn.—Construction work on the line from Nashville to Franklin, Tenn., 20 miles, which was suspended in January, was resumed a few days ago and a force of 200 men is employed in grading and tracklaying. About 12 miles of grading was completed last year. It is expected to have the line in operation by October 1. H. H. Mayberry, president.

Northern Traction Company, Hibbing, Minn.—R. F. Berdie, president, writes that this company proposes to build an electric railway from Hibbing to Eveleth, Minn., 33 miles, via Chisholm, Buhl, Spina, Mt. Iron and Virginia. Grading has been completed from Hibbing to Chisholm, three miles, and one mile of track has been laid.

Oregon Interurban Railway, Oregon, Mo.—We are advised that this company will receive sealed bids up to 6 o'clock p. m. on Wednesday, June 10, 1908, for the construction of 4½ miles of railroad from Oregon to Forest City, Mo. The approximate quantities follow: 60,000 cubic yards of excavation; 47,000 cubic yards of embankment; 62,600 feet of timber and lumber; 2,060 lineal feet of piling, 16 to 35 feet long; 405 tons of 56-pound relay steel rails; 13,000 ties; one steel bridge, 60-foot span; 4½ miles of tracklaying. Specifications, contract, blank proposals, profile and plans can be seen at office of the company. Bids will be received on any one or more items of above; also on the road complete. The board of directors reserves the right to reject any and all bids. B. F. Morgan, Oregon, Mo., president; George Custer, Marysville, Mo., engineer. (Noted May 16.)

Pacific Traction Company, Tacoma, Wash.—It is reported that this company is planning to extend its American Lake line to the encampment grounds on the other side of the lake this summer. E. J. Felt, vice-president and manager.

Redlands & Yucaipe Electric Railway, Redlands, Cal.—This company is arranging to begin construction immediately on its proposed line connecting Redlands, Yucaipe and Oak Glen, Cal., about 22 miles long. It is proposed to erect a power station and repair shop at Redlands. Amusement parks will be operated at Cherry Croft and Oak Glen. Officers: J. M. Neeland, Los Angeles, president; C. S. Chesnut, Redlands, vice-president; C. D. Meyers, Redlands, secretary; M. N. Newmark, Los Angeles, treasurer; W. D. Larrabee, Redlands, general manager. (Noted May 2.)

Rochester Corning & Elmira Traction Company, Rochester, N. Y.—W. C. Gray, chief engineer, 27 Church street, Rochester, writes that grading has been completed from Conesus Lake to Groveland, seven miles, on the proposed line from Rochester to Elmira, N. Y., 120 miles. Grading is in progress from Rochester to Lakeville, 27 miles. The overhead construction will be of the catenary type, for single-phase operation. The Rochester & Southern Construction Company has the general contract. The road will be double-track, laid with 70-pound rails, and will be built according to steam railroad standards. Otto F. Lieders is president; George A. Engert, general manager and treasurer, and S. Feuerstein, electrical and mechanical engineer. (Noted May 2.)

Rochester Scottsville & Caledonia Electric Railroad, Rochester, N. Y.—David C. Salyerds of Scottsville, N. Y., president, has announced that all the right of way and franchises have been secured for the proposed line from Rochester to Portage Falls, N. Y., 52 miles, and that the contract for a considerable part of the construction work will be let in the near future. The route includes Scottsville, Caledonia, Le Roy, Pavilion and Castile. Branches from Pavilion to Warsaw, 12 miles, and from Le Roy to Batavia, 10 miles, are also contemplated. The road will be built for high-speed service, on private right of way, and will be laid with 70-pound rails. Le Grand Brown is chief engineer. (Noted December 7, 1907.)

Rome & Osceola Railroad.—Surveys have been made and right of way has been secured for a line to be operated by either steam or electric power from Rome to Osceola, N. Y., 25 miles. The capital stock is $500,000. Officers: W. Pierrepont White of Utica, N. Y., president; Clifford Lewis, Jr., of Utica, chief engineer.

Steubenville & East Liverpool Railway & Light Company, Steubenville, O.—In order to complete the extension from East Liverpool to Midland and Vanport, Pa., this company is reported to have increased its construction force from 200 to 1,200 men. J. C. Rothery, general manager.

Terre Haute Robinson Olney & Southwestern Railway, Robinson, Ill.—A contract has been let to Charles B. Duffy

of St. Louis, Mo., for the construction of the proposed electric railway from the Wabash river on the boundary line of Illinois and Indiana to Mt. Vernon, Ind. (Noted April 25.)

Texas Traction Company, Dallas, Tex.—The overhead construction on the line from Dallas to Sherman, Tex., has been completed between McKinney and Sherman. (Noted May 9.)

Tropico, Cal.—It is proposed to build an electric railway from Tropico to Burbank, Cal., and a committee has been appointed to secure subscriptions and right of way.

Twin City & Lake Superior Railway, Minneapolis, Minn.—Smith & Jones of Minneapolis have been awarded a contract for clearing and grading for about 30 miles south of the Minnesota-Wisconsin state line near Foxboro on the line from Minneapolis and St. Paul to Duluth and Superior, Wis., 129 miles. Last year grading was completed from Minneapolis to Sunrise, Minn., 38½ miles. Work under the new contract is to be started at once. E. W. Farnham is president and J. H. Thomas is chief engineer, both with headquarters in the Railway building, Minneapolis. (Noted February 1.)

Wabash Valley Traction Company, Clinton, Ind.—D. C. Johnson, president, writes that preliminary work in connection with the proposed line from Danville, Ill., to Terre Haute, Ind., is now being carried on and subscriptions to the stock are being secured. It is hoped to incorporate in about 10 days. (Noted April 18.)

York (Pa.) Railways Company.—This company is said to be considering an extension from the Country club road to Richland avenue, York, Pa. David Young, Jr., general manager.

POWER HOUSES AND SUBSTATIONS.

Brownsville Masontown & Smithfield Street Railway, Masontown, Pa.—A power plant for the operation of this company's proposed 120-mile system of interurban railways connecting Morgantown, W. Va., and Pittsburg, Pa., will be built at West Masontown, 1½ miles west of Masontown on the Monongahela river. This location is about the central point in the system where cheap fuel and water rights are available. It is intended to have the line completed within a year. W. J. Sheldon, McKeesport, Pa., is president.

Escanaba Electric Street Railway, Escanaba, Mich.—On and after July 1 this company will receive power for the operation of its electric railway lines from the hydro-electric power plant of the Escanaba Pulp & Electric Company at Flatrock, Mich., the machinery for which is now being installed. The plant will cost approximately $80,000 and will have an output of 1,200 horsepower. (Noted April 18.)

Guadalajara, Mexico.—The Compania de Tranvias Luz y Fuerza de Guadalajara, which operates the lighting and street railway systems of this city, expects to enlarge its generating stations at La Junta and Juanacatlan, state of Jalisco. It is stated that the present single-phase lines will be equipped for three-phase operation. Comai Corres, general manager, Guadalajara.

Mississippi River & Electric Power Company, Monticello, Minn.—Permission has been granted by the war department for the construction by this company of two dams on the Mississippi river, one at Monticello and another at Clearwater, Minn. The company owns right of way on both sides of the river from Monticello to the southern limits of St. Cloud, Minn., and in addition to furnishing power for lighting purposes is empowered by its charter to construct and operate electric railways.

Salisbury & Spencer Railway, Salisbury, N. C.—A substation will be built jointly by this company and the Southern Power Company, which has just secured entrance into Salisbury, to cost approximately $20,000. H. W. Frund, general manager, Salisbury.

United Railroads of San Francisco.—This company has contracted with the General Electric Company for a Curtis steam turbine direct connected to a 5,000-kilowatt General Electric three-phase 13,200-volt generator to be installed in the North Beach power house. The capacity of the boiler plant also may be increased.

West Penn Railways, Pittsburg, Pa.—This company is building a substation at New Salem Junction, Pa., which will be equipped with two 300-kilowatt 60-cycle motor-generator sets and transformers for transforming and converting current from 22,000 volts, three-phase, to 650 volts, direct current. The company also is rebuilding its storage battery plant at Uniontown and has ordered a 3,250-kilowatt Westinghouse turbo-generator set for installation in the main power station at Connellsville, Pa. It is stated that new coal bunkers and the enlargement of the coal-handling machinery are contemplated.

Personal Mention

Mr. H. C. Allen has been appointed general passenger and freight agent of the Erie Traction Company, Erie, Pa.

Mr. G. W. Mulks, heretofore secretary and auditor of the Los Angeles Interurban and Pacific Electric Railway companies, has resigned.

Mr. H. C. Young, formerly general passenger agent of the Lake Shore Electric Railway, Cleveland, O., has been appointed passenger agent for the Cedar Point Resort Company, operating a pleasure resort near Sandusky, O.

Mr. Bury Irwin Dasent, for the past three and one-half years publicity agent for the Portland Railway Light & Power Company at Portland, Ore., has resigned to become manager of the publicity bureau recently organized to promote the interests of the city of Albany, Ore.

Mr. D. H. Fitts has been appointed general freight agent of the Springfield & Xenia Railway at Springfield, O., succeeding Mr. W. E. Green, resigned. Mr. Fitts has been with the company for a number of years, having started work as motorman.

Mr. L. M. Golliday has been appointed train dispatcher of the southern division of the Public Service Railway at Camden, N. J. Mr. Golliday has had 12 years' experience on steam roads and the interurban lines of Ohio and the middle west, having resigned from the Columbus Delaware & Marion Railway at Columbus, O., to accept his present position.

Mr. D. W. Pontius of Riverside, Cal., has been appointed traffic manager of the Los Angeles-Pacific Railway, effective on May 1, succeeding Mr. F. A. Short, who has been assigned to other duties. Mr. Pontius has been in the service of the Southern Pacific Company for the past 17 years and for the past year has been the company's commercial agent at Riverside.

Mr. A. T. Clark, heretofore assistant to the superintendent of shops of the United Railways & Electric Company, Baltimore, Md., has been appointed acting superintendent of shops, effective on May 9, 1908, succeeding Mr. H. H. Adams, resigned, as noted in the Electric Railway Review for May 16. Mr. H. A. Leonhauser, formerly general foreman of car houses, has been appointed assistant to Mr. Clark.

Mr. A. Sickler was elected vice-president of the Philadelphia & Easton Electric Railway of Doylestown, Pa., at the annual meeting of the company held last week. Mr. J. C. Lugar, general manager and purchasing agent, was elected treasurer of the company, succeeding Mr. J. S. Rawson, who was elected a director. Mr. W. S. Chambers was elected secretary and Mr. David P. Ayars was re-elected president.

Mr. Williston Fish, who has been connected with the law department of the Chicago Union Traction Company since 1899, has been appointed assistant to the president of the Chicago Railways Company. Mr. Fish took a prominent part in the readjustment of the affairs of the Chicago Union Traction Company during the period of its reorganization into the Chicago Railways Company. He is a graduate of West Point.

Mr. N. C. Draper, formerly vice-president and general manager of the Eastern Wisconsin Railway & Light Company, Fond du Lac, Wis., has resigned, effective on June 1, to become district manager of the Zanesville division of the Ohio Electric Railway, with headquarters at Zanesville, O. Mr. Draper has been at Fond du Lac since November, 1895, having previously been connected with the Cleveland office of the Westinghouse Electric & Manufacturing Company. Practically all of his business life has been spent in the installation and equipment of various large electric plants and railway properties throughout the country, and he is therefore particularly well fitted to assume his new duties, comprising the management of 20 miles of city and 65 miles of interurban line in the Zanesville district of the Ohio Electric Railway. The appointment is effective on June 15.

According to press dispatches the Oklahoma legislature has passed a bill to empower the state labor commissioner to fix the scale of wages of labor employed in the various industries in the state. The measure only awaits the signature of Governor Haskell to become a law. When business is dull wages may be reduced, but when an improvement in conditions takes place they must, under the law, be advanced. Every owner, lessee or operator of any industry is required to make a full report annually to the labor commissioner of the condition, earnings, ownership, etc., of the property.

Financial News

Detroit Flint & Saginaw Railway, Detroit, Mich.—The Detroit (Mich.) Trust Company, trustee under a mortgage given by the Detroit Flint & Saginaw Railway on December 1, 1903, has foreclosed the mortgage. The decree of foreclosure was signed by Charles H. Wisner, judge of the circuit court of Genesee county, and the sale of the road ordered. The date of the sale has been set by the trustee for June 18, 1908. The Detroit Flint & Saginaw Railway Company was incorporated for the purpose of building an electric railway from Saginaw to Flint, but only part of the road has been built. Eleven miles of road extending out of Saginaw are operated by the trust company as receiver. The company has a power plant at Bridgeport, Mich., where the car house is also located. The general offices are in Saginaw. The property offered for sale consists of the physical property and the franchises for the construction of the balance of the right of way from the present terminus through the townships of Bridgeport, Frankenmuth, Birch Run, Vienna, Mt. Morris, Genesee, Burton and Flint; also franchises granted by the villages of Mt. Morris and Clio and by the city of Flint. If the road were completed as projected the total mileage would be about 35 miles, serving a population of about 112,000 people. The receiver's report shows that for the year ended November 20, 1907, the road earned above operating expenses, and exclusive of fixed charges, $7,777.93, with the 11 miles of track and two passenger cars. During the five months ended April 20, 1907, the increase in gross earnings over the corresponding period of the previous year was 7.75 per cent.

Odessa & Middletown Railway, Odessa, Del.—The property of this company was bought at foreclosure sale by H. R. Bringhurst for $8,100. The road is four miles in length. The property was sold at Wilmington, Del., on May 6 under foreclosure of the mortgage securing an issue of $50,000 bonds.

Rochester (N. Y.) Railway & Light Company.—The New York public service commission, second district, has approved the issue of $1,474,000 of 5 per cent consolidated mortgage bonds. The proceeds will provide for indebtedness.—Gross earnings of the Rochester Railway in the quarter ended March 31, 1908, were $597,216, as compared with $561,758 in the corresponding quarter of the previous year. Operating expenses were $411,890, as compared with $358,486; net earnings were $185,326, as compared with $203,272. On account of a reduction in other income and an increase in fixed charges the surplus for the 1908 quarter was $67,452, as compared with $105,908 in the preceding year.

Scioto Valley Traction Company, Columbus, O.—Gross earnings in the year ended March 31, 1908, were $360,035, an increase of $26,000 over the preceding year; operating expenses and taxes were $204,239. The deductions from income were $101,316. During the year the company disbursed $7,000 on account of accident claims and $24,000 for maintenance of way and structures.

Toledo (O.) Railways & Light Company.—The committee which has been formed to effect a readjustment of the affairs of this company will include the following: Norman B. Ream and C. Ledyard Blair of New York; Myron T. Herrick, president of the Society of Savings; John Sherwin, president of the First National Bank; H. P. McIntosh, president of the Guardian Savings & Trust Company; J. R. Nutt, secretary of the Citizens' Savings & Trust Company, Cleveland, O., and William B. Hale, Chicago.

Vicksburg (Miss.) Railway & Light Company.—S. S. Bullis writes as follows: "There will be no change in the properties here and no new line built. On May 4 the property of the Vicksburg Railway & Light Company was sold at receiver's sale to me. I am forming two companies—the Vicksburg Lighting Company, to take over the lighting department, and the Vicksburg Traction Company, to operate the street railway."

Washington Traction Company, Springfield, O.—The property of this company was purchased at receiver's sale at Springfield, O., on May 11 by George W. Baker of Washington Court House for $36,667.

Wetzel & Tyler Railway, New Martinsville, W. Va.—H. W. McCoy of Sistersville, W. Va., has purchased the property of this company at judicial sale for $15,644.

Dividends Declared.

Citizens' Traction Company, Pittsburg, 3 per cent.
Columbus (O.) Railway, common, quarterly, 1¼ per cent.
Kansas City (Mo.) Railway & Light Company, preferred, quarterly, 1¼ per cent.

ELECTRIC RAILWAY EARNINGS.

	Gross earnings.	Operating expenses.	Net earnings.	Total charges.	Surplus.

Manufactures and Supplies

ROLLING STOCK.

New York City Railway has ordered one special construction car from Smith & Wallace, Woburn, Mass.

Third Avenue Railroad, New York City, has contracted with The J. G. Brill Company for 50 double-truck cars.

Chambersburg, Greencastle & Waynesboro Street Railway, Waynesboro, Pa., has ordered two double-truck suburban cars from The J. G. Brill Company.

Municipal Traction Company, Cleveland, O., advises us that specifications have not yet been completed for the 100 pay-as-you-enter cars which it has been authorized to purchase.

Lehigh Valley Transit Company, Allentown, Pa., as reported in our issue of April 18, placed an order during the latter part of March with The J. G. Brill Company for four 14-bench open cars for delivery in May. The dimensions of these cars are as follows:

Seating capacity.....56	Height over roof boards...
Weight .....27,000 lb.	.....8 ft. 4⅝ in.
Wheel base.....6 ft.	Bottom of sill to trolley
Length of body.....34 ft.	base .....9 ft. 2⅛ in.
Over dashers.....43 ft.	Track to trolley base....
Over all.....44 ft. 8 in.	.....12 ft. ½ in.
Width over posts... 8 ft. 9 in.	Body .....Wood
Over all.....9 ft.	Underframe .....
	.....Wood, steel plated

Special Equipment.

Brakes .....Peacock	Motors .....Westinghouse
Curtain fixtures.....Acme	Seats .....Walkover
Destination signs.....Hunter	Trucks.....St. Louis
Gongs .....Dedenda	Hangers....Noiseless (Brill).
Interior finish.....Ash	

SHOPS AND BUILDINGS.

New York City Railway.—The receivers for the New York City Railway have obtained a permit from the building department of New York City to remove their steel and corrugated iron car barn at One Hundred and Forty-sixth street and Lenox avenue to the site of the old car barn at Fourth avenue and Thirty-third street. The Lenox avenue barn is 145 feet wide and 280 feet long and it is estimated it will cost $10,000 to rebuild the barn on the new site.

POWER HOUSES AND SUBSTATIONS.

Aurora Elgin & Chicago Railroad, Chicago, Ill.—We are advised that E. F. Gould, electrical engineer, Wheaton, is preparing specifications for a rotary converter and battery substation to be erected at Elgin. The electrical apparatus has been purchased. The new installation will take the place of a power station which originally furnished current for the Elgin city lines.

Vera Cruz Electric Light Power & Traction Company, Vera Cruz, Mexico.—Arrangements to provide current for electric traction, in addition to the power and lighting service now furnished the city of Vera Cruz, have been completed by this company. A large extension to the present power plant at Vera Cruz to care for the additional load is about completed and there are being installed six 470-kilowatt alternating-current generators to be operated by Diesel oil engines. Current for lighting and railway service will be distributed throughout the city by the underground system. Two Westinghouse 120-kilowatt motor generator sets will transform a part of the alternating current to direct current for use in connection with the railway service. Storage batteries will be used and a 30-panel switchboard complete with all instruments, battery regulators, switches, etc., for the control of the generators, power and lighting feeders, motor generator sets, battery, railway feeders, etc., has been ordered. Eleven Westinghouse double motor equipments, including motors, controllers and auxiliary apparatus, will comprise the electrical equipment of the cars. It is stated that this will be the first installation of the size in Mexico employing oil engines for operating the generating equipment. The electrical apparatus for the railway service was supplied through G. & O. Braniff & Co., Mexico City. The road heretofore has been operated by horsepower.

TRADE NOTES.

Herbert C. Petty was elected on May 13 a director of the Crocker-Wheeler Company, Ampere, N. J., manufacturer of electric dynamos and motors. Mr. Petty accepted a position in the sales division of the company in January, 1903, and has advanced rapidly to the position of contract manager. The present honor conferred upon him is a recognition of the esteem and confidence which he commands among the stockholders of the company.

Tweedy, Hood & Finley, Incorporated, Fisher building, Chicago, has recently been appointed sales agent for the Roofbestos Manufacturing Company of St. Louis, Mo., manufacturers of prepared roofing for train sheds, freight houses, depots, etc.

William A. Pitcher, for the past two years eastern railroad representative of S. F. Bowser & Co., Ft. Wayne, Ind., was one of the number who lost their lives in the burning of the Aveline hotel at Ft. Wayne on Sunday morning, May 3. The company feels keenly the loss of Mr. Pitcher and his many friends among the railroad fraternity will regret to hear of his sudden death. He was 48 years of age. His successor has not yet been appointed.

Vacuum Impregnating Manufacturing Company, 50 Church street, New York, has installed at 146 Throop street, Chicago, an up-to-date vacuum drying and impregnating plant and is now prepared to treat all types of field and magnet coils by this system. An interesting feature to electric railways of this system is the rejuvenation of old coils. The company states that old coils, unless dead short circuited, can be successfully reinsulated at a comparatively slight expense and replaced in service.

Allis-Chalmers Company, Milwaukee, Wis., has made shipments during the past week of a number of turbo-generator units aggregating 9,500 kilowatts in capacity, normal rating. These include one 1,000-kilowatt units for the Athens Electric Railways, Athens, Ga.; two 1,500-kilowatt units for the Youngstown (O.) Sheet & Tube Company; one 1,500-kilowatt units for the city of Jacksonville, Fla.; two units, a 500 and a 1,000 kilowatt, for the Celluloid Company, Newark, N. J.; one 1,500 kilowatt machine for the Tremont & Suffolk Mills, at Lowell, Mass., and a 1,000-kilowatt machine for the Nairn Linoleum Company, Kearney, N. J.

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

H. W. Johns-Manville Company, 100 William Street, New York.—A neat folder calling attention to the advantages of Keystone hair insulator for sound deadening and weather-proofing purposes; also a small folder describing the fire extinguisher sold by this company.

Tweedy, Hood & Finley, Incorporated, Fisher Building, Chicago.—An attractive folder calling attention to the railway supplies handled by this company. Also a folder describing "Roofbestos," a composition suitable for factories, railway depots and sheds, engine and boiler houses, buildings, etc.

Topping Brothers, 122 Chambers Street, New York City.—Burrows ball bearing jacks are the subject of a pamphlet. These jacks are specially designed for railway use and are made in 25 styles. The railroad tools made by the company also include a car inspector's cone bearing jack, portable tool grinder, a track drill and a brake beam clamp.

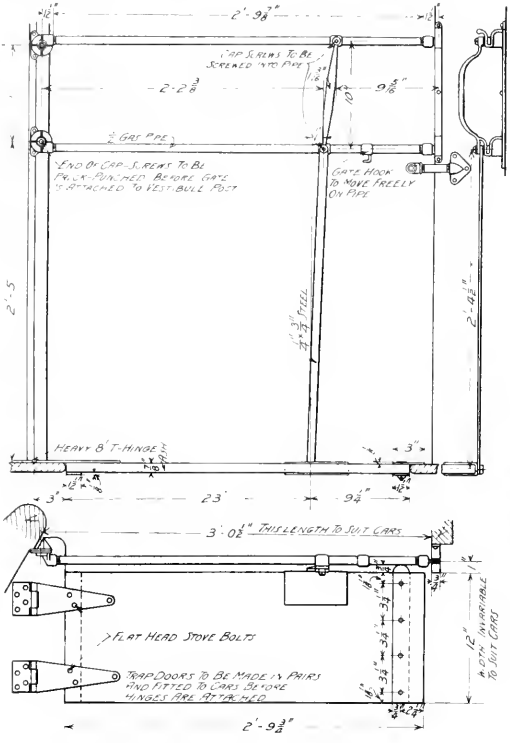
Expanded Metal & Corrugated Bar Company, St. Louis, Mo.—The first volume of a series of bulletins on designing methods for reinforced concrete construction has been issued, including general principles of design for buildings. It is intended that each issue will be devoted to a particular type of structure and the problems relating thereto will be discussed, methods of analysis given and illustrations showing detailed designs. These pamphlets have perforated backs for convenience in filing. A pamphlet descriptive of an economy unit frame for accurately locating and holding the main reinforcing bars in position has also been issued.

General Electric Company, Schenectady, N. Y.—Bulletin No. 4582 describes the GE-205 commutating pole railway motor. This motor is especially adapted for operation on heavy grades or with equipments geared for high-speed work which have also to start and stop frequently as in city services. An extensive description of the mechanical and electrical details of the apparatus is given in the bulletin. Under the heading of "rating" several pages are devoted to the proper selection of railway motors for various services, and a table is given showing schedule speeds under different conditions. Characteristic curves of different motors and dimension diagrams are included. Bulletin No. 4587 describes a new type of resistance unit for rheostats, fixed resistances, laboratory use, etc., which has recently been put on the market. Under the title, "Two Aids to Better Service," a neat folder, No. 3654, has been issued calling attention to some of the reasons why the GE luminous arc headlight has been adopted.

COMBINATION PLATFORM GATE AND TRAP.

The accompanying illustration exhibits the detail dimensions of a combination platform gate and trap door, used on the city cars at Oakland, Cal.

The various parts are so connected that when the trap is



Platform Trap and Gate Used at Oakland, Cal.

raised the gate folds with it closely against the end bulkhead. With the trap closed the gate is fastened securely in place so that it forms a substantial barrier which will prevent anyone being crowded off the blind side of the platform.

NEW CRANE PIPE MACHINE.

The Crane Company, Chicago, recently has placed on the market a new pipe cutting and threading tool designed to meet the demand for a low-priced machine, operated by hand or power, for high-class service. All parts have been designed to withstand any strains that such a pipe cutting and threading machine may be subjected to, and simplicity of operation, adjustment and arrangement has been carried out to the minutest detail. The capacity is for pipes from ⅛ to 2 inches in diameter.

This tool possesses many features which increase output and facilitate ease of operation, the gripping, threading, cutting off and adjustment having been so arranged that no unnecessary operations are required.

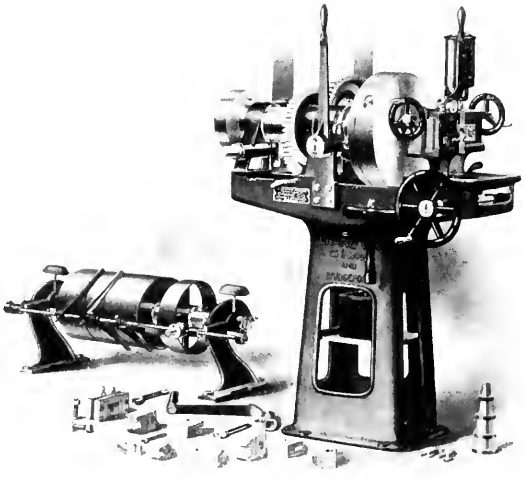
The frame is one casting, having bed and stand in one piece, eliminating the use of light legs and giving greatest rigidity with minimum weight and floor space.

The die head is bolted to a movable carriage, with ample travel. Upon the die head are the dies, pipe guides and cutting-off tool. The dies are of the improved adjustable type, made collapsible, and are similar to those supplied in Crane hand die stocks. The dies are carried in suitable frames, sliding in guides, the frames being moved by a screw operated by a hand wheel. The dies are set to gauge by a simple locking device, which allows any number of pieces of pipe of the same size to be threaded without any further adjustment. These dies have four cutting edges and will give good service on either steel or wrought-iron pipe. Dies are made interchangeable and the one die of a set may be replaced if broken, thus reducing the repair bill to the minimum. Dies, when not in use on machine, may be used in a hand stock. Change in size of dies may be made very quickly.

The gripping chuck is of the quick gripping type, rapid in action and powerful. The pipe may be released or gripped by the throwing of a lever without stopping the machine. The chuck is adjustable to the different sizes of pipe within range of the machine without moving or altering the jaws, which are of tool steel carried in steel holders and are removable for grinding or replacing.

The rear end of the spindle contains a universal centering chuck, compact in design and readily adjusted to the various sizes of pipe.

Oil is supplied by a small tank supported on a swivel joint above the die head. A second small tank is placed in the



New Crane Pipe Machine.

frame, and to this the oil from the dies returns, the supply being controlled by a pet cock.

One pulley is necessary to drive. Three changes of speed are obtained by gears which are shifted by a lever placed on the frame. All machines are supplied with necessary crank for hand operation.

Bolt dies ¼ to 1½ inches can be furnished if desired. All necessary pipe gauge blanks, wrenches, etc., are supplied with the machine. The principal dimensions are: Countershaft pulley, 9¾ inches in diameter by 3½ inches face; countershaft speed, 200 revolutions per minute; floor space, 14 by 23 inches. The weight is 700 pounds.

LAST YEAR'S TURBINE BUSINESS.

Retrospective of the development during the past year of the steam turbine, the accompanying figures, reported by the Westinghouse Machine Company, are interesting as tending to controvert the general impression that the turbine business suffered heavily during the year. Although one month's business in 1906 still holds the record at 62,100 kilowatts, the year 1907 was marked by an average demand quite as large. As late as July orders for 34,750 kilowatts were taken during that month as compared with 25,750 for July, 1906, which is a particularly gratifying showing. For the first nine months of each year the demand for turbines was as follows: 1907, 158,550 kilowatts, and for 1906, 152,400 kilowatts, or, taking the middle six months of the year, from April to September inclusive, thus excluding the usual midwinter activity, as well as the late depression, the average per month is as follows: 1907, 15,833 kilowatts; 1906, 14,365 kilowatts. Thus it is apparent that up to the period immediately preceding the depression of October the demand for turbine equipment shows a steady increase. It is interesting to note in this connection the ultimate results of commercial activity of the past few years. Had the business of the company kept on increasing at the same rate as prevailed during 1904 and 1906, the year 1910 would have been marked by an annual output of 1,912,000 kilowatts, or the rate of 160,000 kilowatts per month.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Wanted—Position as armature winder and mechanic. Ten years' experience. Can furnish good reference. Address "No. 586," care of Electric Railway Review, Chicago.

Want work on right of way, franchises, stock sales, etc. Promotor's right-hand man. Always in harness. Reliable and experienced. Address "No. 588," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Wanted—Position as superintendent of rolling stock or master mechanic on city or interurban railway. Have satisfactorily handled similar work on large metropolitan properties since horse car days. At liberty now; references exceptional. Address "No. 580," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

General manager wanted for combined electric railway, electric light and gas property, operating 25-mile city and interurban railway located in middle west. Promotion assured for capable man. Must be able to handle relations with public, as well as operate property economically. Address "No. 589," care of Electric Railway Review, Chicago.

BUSINESS OPPORTUNITIES

Wanted—To exchange, first mortgage gold bearing 5½ per cent bonds for material for electric railway, issue limited as to amount per mile; right of way held by company in fee simple. Those interested address Chicago Ottumwa & Western Railway, Hamilton, Ia.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

Wanted—Copies of Street Railway Review, January to June, 1906, inclusive, and one copy each January and February, 1906. Also Electric Railway Review for January 5, 1907. State condition and price. Address "No. 582," care of Electric Railway Review, Chicago.

Electric Railway Review

PUBLISHED EVERY SATURDAY BY THE WILSON COMPANY, CHICAGO

Entered as second-class matter January 5, 1907, at the postoffice at Chicago, Ill., under the act of March 3, 1879.

CHICAGO: 160 Harrison Street
NEW YORK: 50 Church Street
CLEVELAND: 1529 Williamson Bldg.

VOL. XIX
No. 22

CHICAGO, MAY 30, 1908

Whole No.
295

Subscription: Domestic, $2.00
Foreign, 5.00
Canada, 3.50

Index of the Review.

By reason of the consolidation of the Electric Railway Review and the Street Railway Journal, which becomes effective on June 1, this issue completes Volume 19 of the Electric Railway Review. The first issue of the "Electric Railway Journal" will be that of June 6. For the convenience of those who wish to bind their copies of the Electric Railway Review a comprehensive subject index of the articles comprising this volume from January 1, 1908, to date has been prepared. Copies of this index will be forwarded to subscribers upon request addressed to the Electric Railway Journal at the Chicago office in the Old Colony building or at the principal office, 239 West Thirty-ninth street, New York.

Belt Lines and Congestion.

Belt line service occupies a valuable place in many cities where the conditions favor the handling of traffic by long looped routes, but a case sometimes arises where the introduction of belt line movements works a real hardship in the facility of taking care of the through business. An instance of this occurred in Boston recently in connection with a petition to the railroad commission for additional surface cars in the Charlestown district. The petitioners claimed that the present facilities were inadequate, causing long and vexatious delays and suggested as a remedy the establishment of a belt line with cars operating on a maximum headway of 10 minutes. The board on investigating the area in question found that it was served by both the surface and elevated trains of the Boston elevated, and that if the short-time headway called for in the schedules could be properly maintained, the accommodations would be reasonable. The unsatisfactory conditions were not due to an insufficient number of cars, but to physical obstacles beyond the company's control. From a study of traffic tables the board concluded that the installation of an additional line would tend to further congest the travel. If a belt line were installed to handle the situation it might be possible to operate it without its being subject to bridge and grade crossing delays, but in order to do so it would disarrange existing schedules. Cases of this kind illustrate the need of thorough analysis before establishing new routes to meet an apparent demand for additional facilities. On general principles the value of a belt line service in a district served by irregular headways would not be questioned, but local conditions exert modifying influences upon the advisability of changes.

Vigilance in Discipline.

Again we repeat the statement that the increase in traffic which the electric railways are pleased to meet throws greater responsibility upon the operating departments. The load, of course, falls upon the shoulders of the superintendent of transportation and indirectly on his assistants and train crews. Under ordinary conditions the operating of cars according to well-tried schedules requires no more vigilance than the ordinary thought needed to observe the rules of the road. However, when it becomes necessary that changes in existing schedules be made, resulting either from demands for increased service or from a reduction to accommodate decreasing traffic, then the responsibility of direction and enforcement of discipline must become greater. Variations in schedules may require changes in long-established meeting points. The dangers of so-called lapses of memory aided by force of habit assert themselves and call for constant vigilance at such times. A thoroughly carried out system of demerits or other method of disciplining shows itself to be of greatest value when schedules are being changed. A recent instance where a change in a long existing schedule was replaced by a shorter headway with varied meeting points resulted in a misunderstanding on the part of the train crews and was attended by a disastrous head-on collision. In this case the trainmen of the two cars which collided, a limited and a local, were endeavoring to follow a new and faster schedule. In so doing the men either forgot a meeting point or misinterpreted their orders with the disastrous results so well advertised by the daily papers. The dispatching system has received much attention of late and in most cases the methods conform to well-tried principles; yet even with a most perfect dispatching system extreme vigilance on the part of the men higher up will only prevent a laxity which sooner or later may result in disaster. With the opening of summer the traffic to amusement resorts and the usual excursion business will require a variation in schedules in many instances and it is at this time that, in a spirit of constructive criticism, we suggest the dangers that may follow a relaxation in watchfulness by those responsible for the operation of electric interurban cars.

Oil Engine Testing.

The use of oil engines of various types in moderate capacity power plants is much more general than the running of economy tests upon this form of prime mover. In very small installations it doubtless does not pay to test the equipment except by the results of service operation, but if the cost of power is an important part of the total running expenses much can be learned from a test that cannot be determined in any other way. It is a mistake to assume that the making of a test on an internal combustion engine is a complex and expensive matter. All the essential data to enable the performance of an engine to be judged and adjusted can be secured with few instruments and small trouble compared with the burdens of making a test of equal thoroughness upon a steam plant of the same size. The physical quantities concerned in the operation of an oil engine are readily measured, even in units as large as 500 horsepower. The test record should give the principal dimensions of the engine, the various temperatures, pressures, speeds, cooling water quantities, calorific value of the fuel burned, composition of the exhaust gases and cylinder power as deduced from carefully taken indicator cards. If the engine is direct connected to a generator and the unit has been purchased on a combined efficiency specification, it may not be necessary to measure the brake horsepower of the engine, but in single engine testing the measurement of brake horsepower is perhaps the most satisfactory course, for it enables the mechanical efficiency

and the service economy of the engine to be closely ascertained without the uncertainty of an estimate. The latter performance can of course be secured on the kilowatt-hour basis, but unless the efficiency of the generator at various loads is known the exact part played by the engine in the performance of the set must in some degree be estimated instead of experimentally measured. Summing up these statements the point to be remembered is that it is far easier to test an engine using oil than a steam plant and the returns are just as great.

Advertise Service at Stations.

All managers of electric railways should appreciate that keen competition exists in most cities between the street railways and the local cab drivers and owners. The competition is most severe at railroad stations and the cabs undoubtedly carry a large number of strangers each year who have no information concerning the facilities offered by the local traction company. As a rule no attempt is made to advertise local trolley service to steam railway passengers either before they reach their destinations or at or near the railway stations. The managers of electric railways are likely to ignore this subject in the belief that the travelers who can afford to use carriages will do so anyway, regardless of the trolley facilities. Further thought than that belief indicates is justified. The traveling public, entering a city on a steam road, should be impressed with the advantages of electric railway service, its promptness and low cost. If electric railway companies post clear maps of the system, with the timetables or at least the headways of the most important lines in conspicuous places in railroad stations the investment would be slight and it should yield a large return. A slight consideration would probably induce the steam railway companies to grant the privilege of posting maps of this character. The use of illuminated signs showing the car routes leading to principal points would assist strangers. It might be possible to arrange with news agents on the trains or with the railroad advertising agencies to distribute inexpensive folders as trains approach the more important terminals. Observation has shown that the average traveler will patronize the local trolley service in preference to a carriage costing 10 to 20 times as much if he can only be made acquainted on arriving at a strange city with the fact that the street railway will transport him quickly to his point of destination. If the electric railway lines pass the principal hotels the fact ought to be advertised plainly, so that the new arrival may have an opportunity to select at once which means of transit he will take. In fare per passenger the electric road is so much more desirable than its competitors that a little energetic advertising will save many fares that are now lost.

GAS ENGINES AND THEIR RATING.

For many years internal combustion engines have given reliable service in handling small loads. Recently, however, the desire for increased economy in electric power plant operation has brought about a widespread study of the gas engine and gas producer problems with a view to the use of large units. The results have been wonderful. During a short period the size of gas engines which can be relied upon for driving electric generators has increased from units of 100 horsepower or less to engines with ample capacity to operate 5,000-kilowatt electric generators.

One of the best indications that the gas engine is sure to become a favored prime mover is because no engineering society of any prominence now neglects to appoint committees to study the problem or have papers presented to it written by those particularly interested in gas engine development. At the convention of the National Electric Light Association, Chicago, on May 19, 20, 21 and 22, a committee of three members presented a printed report comprising 172 pages, descriptive of and discussing the recent advancements in the gas engine field. The conclusions of this committee are especially valuable at this time.

Because of the high thermal efficiency of the combined gas engine and producer it is held that advancement in this field must come rapidly and therefore power users can well afford to study the problem. While the relative efficiency of a steam plant with engines and turbines and a combined gas producer and gas engine plant cannot be set down in definite figures it can, nevertheless, be safely stated that the gas engine plant has the advantage in economy of operation. Conditions under which the larger gas engines are now operating and the varied design of the units do not yet make it possible to obtain any authoritative figures as to operating costs and maintenance. The committee, however, says: "There should be available within the next year information as regards the operating expenses of large gas engines that will enable comparisons to be made with the operating expenses of steam engines or turbines."

The enormous growth of the gas engine business is made apparent when it is stated that there are today installed and building in this country alone at least 300,000 horsepower in large units. The committee in its report holds the opinion that this enormous investment indicates an assurance on the part of the operator that the gas engine is a reliable prime mover. "Large engines have been used long enough to demonstrate that continuous service is assured and that the design today is well enough established to convert commercial gases, practically of all kinds, into power by the selection of the best types and arrangements to suit the individual installation. The mechanical features have been, from time to time, materially simplified, and continuous operation can be expected with no more attention than that given to steam engines of equal capacity."

It is recommended by the committee that the capacity rating for gas engines should be standardized and expressed in a manner that will give some definite relation as to the actual power produced. This might be expressed in piston displacement or in some convenient form of measuring the maximum power developed under prescribed conditions. The rated capacity should bear an approximately fixed ratio to the maximum capacity, which should determine the uniform percentage of overload. This standard rating should be based on the character of the gas to be used, as the capacity of the engine depends upon the character and the thermal value of the gas used.

The most important part of any committee report is the set of recommendations or conclusions. The conclusions of this committee asking for a standardizing of the rating of engines should not be tabled. Those within whose province it is to handle these matters will render the electric railway industry a great service by furthering the work of formulating rules for the standard rating of gas engines.

PAINTING POLES NEAR SWITCHES.

To the Editors:

In reading the issue of the Electric Railway Review for May 16 we are somewhat interested in the editorial regarding painting trolley poles near switches, on page 587, and, although the scheme outlined in your article is apparently a very good one, we have one here in the east that can beat it as to practicability and slight expense for maintenance. The scheme is as follows:

Start about five poles away from the switch or sharp curve or any point on the road where it is desired to call the motorman's attention to the fact that care or caution should be exercised, and put a narrow circular stripe around the pole on a level with the matorman's eye. Stripes should be at an angle similar to the marking of a barber pole. For

slight caution one single stripe is sufficient for the first pole, for the second pole two stripes, for the third pole three stripes.

Where extreme caution is to be used they usually start by placing one stripe about five poles away and one additional stripe on each following pole until the last or fifth pole is reached, which is the one nearest to the switch or section of the road it is desired to bring to the attention of the motorman.

You will see that these stripes can be very readily seen and the cost for keeping them bright is slight compared with painting the lower section of the pole, as outlined in your recent article.

Any suitable color that is plainly discernible to the eye at a distance will answer; that is, we mean some color should be selected that will naturally attract the eye when looking in that direction. In doing this you will obtain the best results from such a scheme. W. R. LYALL.

Manager Railway Sales Department Stuart-Howland Company.

Boston, Mass., May 25, 1908.

STANDARDIZATION COMMITTEE ASKS DATA ON CARS.

The committee on "Standardization" of the American Street and Interurban Railway Engineering Association has issued to general managers and master mechanics of member companies a circular letter requesting information and answers to a number of questions bearing on the subjects of standard heights of couplers for city and interurban cars, standard automatic couplers for interurban cars, radial draft rigging, standard height of platforms, standard height of car steps and standard height of bumpers, which the committee has taken up for consideration following the line of work pursued last year. Accompanying the letter is a data sheet (No. 31) calling for information in regard to the character of equipment operated on the various lines. This information is required by the committee in compiling its report so that the standards to be recommended this year will represent the needs of the entire membership of the association rather than the preference of the individual members of the committee.

Accompanying the data sheet is a drawing which has been prepared to assist in identifying the dimensions called for. This drawing is reproduced herewith. Corresponding dimensions for city and interurban cars are indicated by the same letter, but those for the interurban car are preceded by the letter I, while those for the city car are preceded by a C. Replies are requested to the following questions:

1. City cars operated: Single-truck? Double-truck?

2. Interurban cars operated: Passenger? Freight?

3. To what extent do you operate two or more cars together in trains in city service?

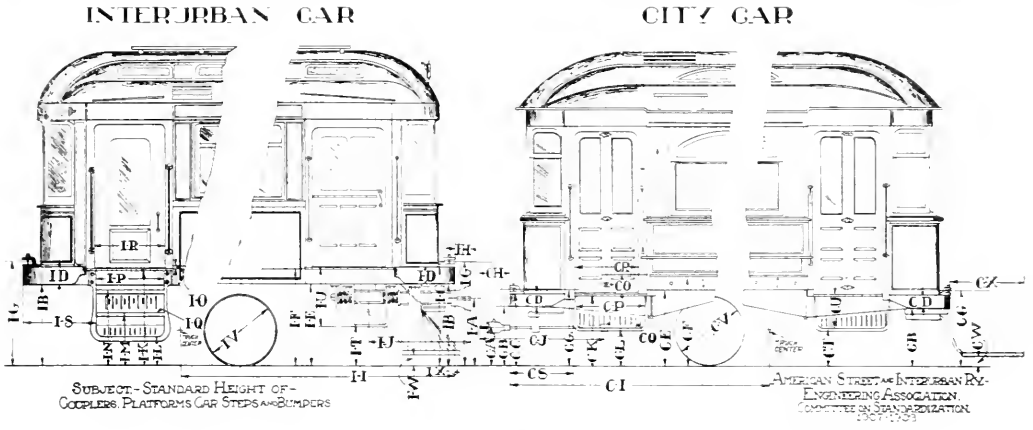
4. In interurban service?

5. Number of cars with automatic couplers? Link-and-pin type? City? Interurban? Total? M. C. B. type? City? Interurban? Total?

6. Are there any state or municipal laws affecting your lines regulating any of the dimensions called for in this data sheet?

Recipients of the letter are requested to fill in the blank with answers to the following questions, giving dimensions in accordance with their latest or most approved practice and also the dimensions recommended for adoption as the general standard for both city and interurban cars:

(a) Height from top of rail to the center of coupler?
(b) Height from top of rail to the bottom of bumper?
(c) Height from top of rail to the top of bumper?
(d) Width of bumper?
(e) Height from top of rail to bottom of side sills?
(f) Height from top of rail to floor of car?
(g) Height to the center of bumper pocket coupler casting?
(h) Distance that coupler extends beyond bumper?
(i) Distance from truck center to end of bumper?
(j) The length of radial coupler from the pocket pin to the face of the coupler?
(k) Height from top of rail to the top of platform floor?
(l) Height from top of rail to top of tread on first step?
(m) Height from top of rail to top tread on second step?



Standardization—Showing Dimensions for City and Interurban Cars on Which Information is Requested.

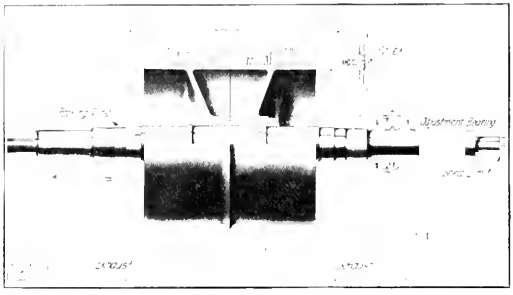
(n) Height from top of rail to the top of third step?
(o) Height of rise from vestibule platform to the floor of car?
(p) Length of step treads?
(q) Width of step treads?
(r) Width of door or opening from step to platform?
(s) Length of overhang between the center of step treads and end of bumper?
(t) Height of motorman's step above rail?
(u) Height of motorman's step to platform of car?
(v) Diameter of wheels?
(w) Height from top of rail to the bottom of pilot board or life guard?
(x) Distance pilot or life guard extends beyond bumper?

The committee will very much appreciate any drawings, cuts, photographs, suggestions or any information whatever bearing on the above subjects, as well as any information as to the style of couplers and of bumpers and any arrangement for a connecting bar between interurban and city cars of unequal height of drawbars, also any suggestions of means to prevent interurban cars from telescoping or passing over cars with lower bumpers.

Replies are to be forwarded before June 15 to W. H. Evans, master mechanic of the International Railway, Buffalo, N. Y., chairman of the committee on "Standardization."

DOUBLE-FLOW STEAM TURBINES OF THE PITTSBURG RAILWAYS COMPANY.

The initial installation of any new and important type of machinery always possesses peculiar interest to those concerned in the progress of the art. And for this reason a description of recent extensions at the Brunot island power plant, incorporating the new Westinghouse double-flow turbine, will be of interest.



Westinghouse Double-Flow Turbines—Figure 1.

The Brunot island station not only serves most of the railway system in Pittsburg and Allegheny, but also a large part of the lighting for the same territory. And owing to the extraordinary increase in the demand for power, it was found necessary to increase the plant capacity considerably beyond original estimates. In the present building, room had already been provided for three additional 1,500-kilowatt cross-compound condensing engines, but as the necessary extension far exceeded these provisions, steam turbines were adopted, with the result that instead of 4,500 kilowatts, a total of 18,000 kilowatts capacity has been installed, with still sufficient room for an additional turbine. In other words, the space originally provided for 4,500 kilowatts in engine-driven machinery accommodates 23,000 kilowatts.

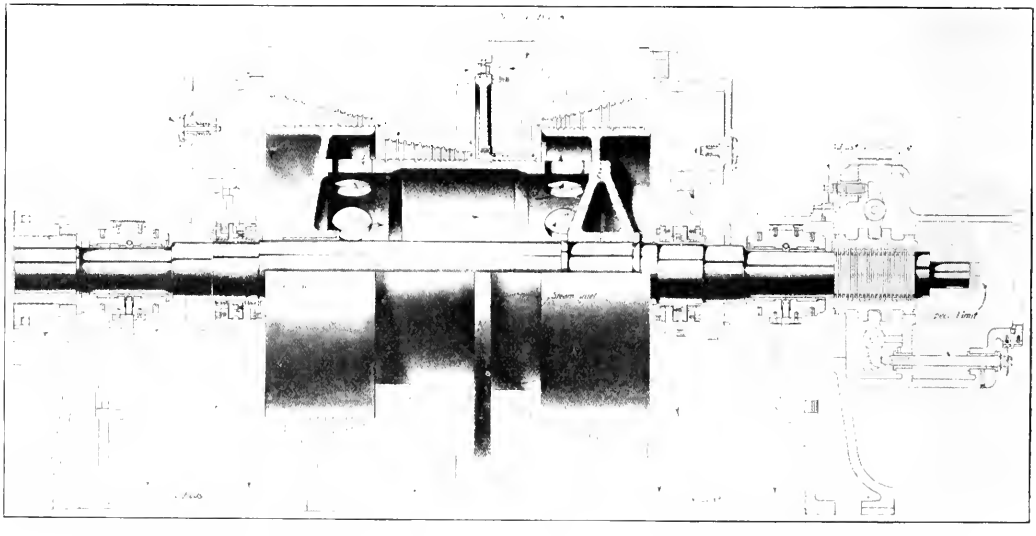
For this large extension a new boiler house is being erected parallel with the present boiler plant, and will contain six 400-horsepower Babcock & Wilcox water tube boilers, all equipped with Westinghouse new model Roney mechanical stokers. The boilers will be arranged in pairs, discharging into eight independent stacks 7 feet internal diameter and 250 feet high.

An interesting feature in the Brunot island plant is the fact that turbines driving 11,000-volt three-phase alternators are in electrical parallel with two-phase 6,600-volt engine-driven units. The turbine equipment consists of one 3,000-kilowatt and three 5,000-kilowatt double-flow units. The smaller unit has been in successful operation nearly one year; the larger units are in course of erection. Each turbine is connected by a short and direct exhaust duct to an Alberger condenser of the "centrifugal jet" type.

Each unit rests upon reinforced concrete plates supported entirely by six reinforced concrete columns, thus giving ample space around the condenser, which could have been placed entirely within the turbine foundations had this been necessary. The concrete employed to construct a foundation for one of the 1,500-kilowatt cross-compound engine units would be sufficient to build the four foundations required by the 18,000-kilowatt capacity double-flow turbines.

Double-Flow Turbines.

The most interesting feature of this plant is the double-flow turbine installation. The following description deals with these particular machines in considerable detail, inasmuch as this turbine has not been described to any extent by the technical press:

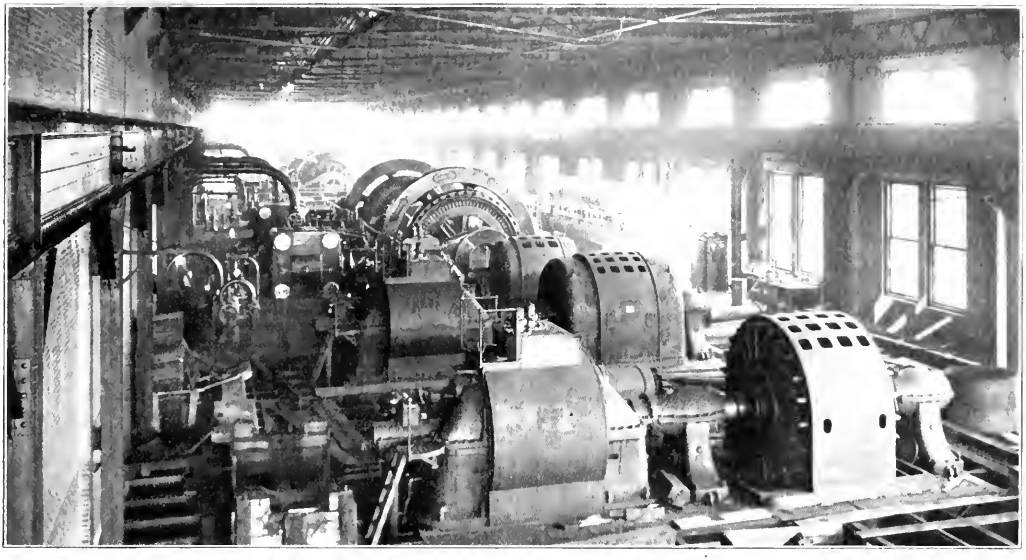


Westinghouse Double-Flow Turbines—Figure 2—Showing Arrangement of Actual Unit with Impulse Blades.

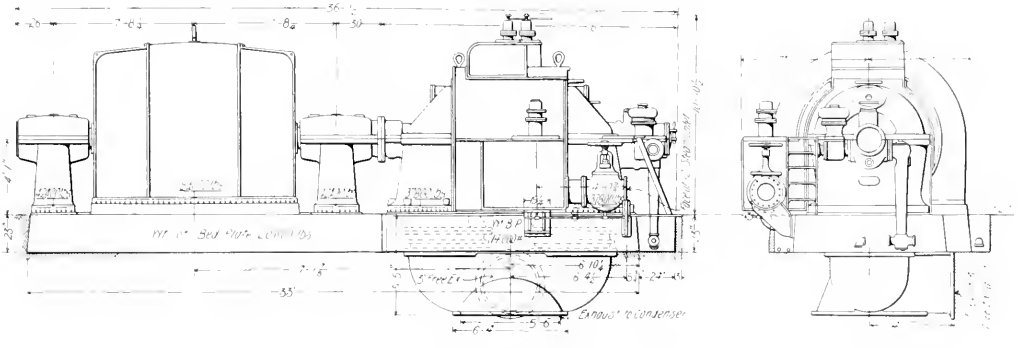
The double-flow principle, as embodied in these large machines, is essentially a modern development brought about entirely by consideration of mechanical construction. It is not by any means unprecedented—in fact, the original Parsons turbine, constructed in 1880, was of the simple double-flow type. In modern hydraulic work, the double-flow principle is very largely employed to produce a rotor running in perfect axial equilibrium. In small machines, however, the advantages of the double-flow principle are not as pre-eminent as in the large, principally because of the absence of the necessity therefor from a mechanical standpoint, and by reason of the fact that the economy of two small machines is not likely to

be as good as one of twice the capacity. In turbines of very large size, however, where proportions exist more favorable to the attainment of high economy, the latter advantage does not obtain.

The double-flow turbine may thus be regarded as the result of an insistent demand for turbine-generating units of larger capacity at high speeds. For the large machines, the advantages of the combined impulse and reaction principle of steam expansion, together with the double-flow construction, are so important that the practical result, as embodied in the machine under description, is most fortunate. The Parsons and the double-flow type are practically upon the same basis as regards economy. The advantages of the double-flow construction will probably be most clearly understood by first considering the low pressure double-flow turbine shown in Figure 1. Here we have a turbine of the simplest possible construction, consisting entirely of two identical Parsons turbines placed end to end, taking steam at the center and exhausting at both ends. It will be evident by an examination of the illustration that since the two elements are identical, and the steam flows through them in opposite directions, the axial thrust of the steam on the blades, due to the difference of pressure between the inlet and outlet of each element, will be exactly the same in both sections. Therefore, perfect steam balance under all conditions of pressure, vacuum and load, is obtained without the use of dummy or balance pistons. As these low-pressure turbines are designed to utilize all the exhaust steam from a non-condensing reciprocating engine, it is possible to tie the engine and turbine together electrically, thus making the use of a governor on the low-pressure turbine unnecessary. With the exception that, as mentioned, the governor may often be omitted from the low-pressure turbine, it is practically identical with the high-pressure double-flow turbine. In fact, the high-pressure machine is directly evolved from the low pressure by the simple addition of a high-pressure impulse element mounted at the center of the rotor, this simple element serving in a capacity closely analogous to the high-pressure cylinder of a triple-expansion reciprocating



Westinghouse Double-Flow Turbines—Interior of Brunot Island Station of the Pittsburg Railways Company, Showing Turbines During Erection.



Westinghouse Double-Flow Turbines—Side and End Elevation of Turbine for Brunot Island Power Station.

engine. Figure 2 represents the final step in the evolution of the present complete high-pressure machine.

Steam enters the turbine through a flanged opening in the lower half of the casing, from which it is piped directly to nozzle blocks. For convenience in illustrating the nozzle block is shown at the top, whereas it may be located at any point in the periphery nearest the inlet. Expanding in suitable nozzles, the steam impinges upon the impulse blades, enters the impulse wheel chamber, and is distributed evenly around the casing so as to enter the intermediate Parsons section of the turbine around the entire periphery of the rotor. As in the single-flow turbine, the steam then divides along two separate paths, one-half entering the left-hand section of low-pressure blading, the other passing through the interior of the rotor shell, which forms the connecting passage to the remaining low-pressure section of blading at the right-hand end of the turbine. Discharging from the last rows of low-pressure blading, the steam passes into the exhaust connections and to the condenser in the normal manner.

As the same pressnre exists on both sides of the impulse wheel disc, this is not subjected to any end thrust and requires no balancing. The difference of pressure between the inlet and outlet of the intermediate section is accurately balanced by a dummy piston of moderate dimensions, located between the impulse wheel and the right-hand low-pressure section. And since the thrusts in the low-pressure sections are in opposite directions and therefore balanced, the entire turbine runs in equilibrium under all conditions of vacuum, pressure and load. It is, of course, necessary to provide means for accurately fixing the axial position of the rotor, and for this purpose an adjustment bearing on the right hand of the shaft is, as usual, fitted. It consists of a number of collars turned in the shaft, into which fit corresponding brass rings fixed in the adjustment blocks. The upper and lower halves of the adjustment bearing may be moved by means of micrometer screws, as shown, thus permitting the axial position of the rotor to be accurately known at all times.

Rotor.

Referring again to Figure 2 it will be seen that the rotor consists of five cast-steel members mounted on a through shaft. The shaft carries its load at one-third distance from the points of support, thus permitting a lighter shaft than required for distributed loading and practically eliminating the possibility of deflection. These are firmly pressed on the shaft and locked to prevent movement. To the opposite end of the rotor is fitted a bronze bushing surrounding the shaft, permitting it to move axially without appreciable resistance under any differential expansion of shaft and rotor body.

The impulse element consists of a flanged cast-steel disc forced on to the rotor body with a pressed fit and securely keyed. The flange at the base is grooved and forms the dummy or balance piston for the intermediate Parsons section. The nozzle block is an independent casting, separate from the turbine cylinder. Receiving steam from the governor valve, this restricts high pressure and high temperature to a comparatively small casting which is free to expand and contract with changes of temperature and may easily be designed with ample strength.

Parsons Element.

Except for the division of the low-pressure section, this part of the turbine is identical with the single-flow construction, consisting of a series of rows of moving and stationary blades, increasing in height to allow for the increased volume of the steam. In the Parsons section, it will be recalled the velocities from stage to stage remain practically constant. The blades are inserted in grooves cut in the spindle and cylinder body, and are securely held in place by calking the soft spacers, or distauce pieces inserted in the grooves between the blades. The diameters of the low-pressure section are chosen so as to permit the same size blades being used in both intermediate and low-pressure sections, thus simplifying the blading considerably.

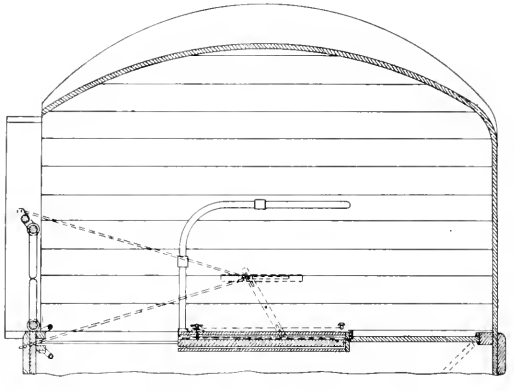
Governing.

Essentially the same system of governing is used in the double-flow as has become familiar in the single-flow design; namely, the "puff" or "gust" system, comprising a constant nnmber of admissions per minute with a variable duration of admission according to the load. This refinement of the purely throttling method is distinctly different from the principle of governing by adding nozzle after nozzle, all at maximum pressure, as the load increases. The type of governor controlling the double-flow turbine is of the sensitive fly-ball type, differing only in minor details from the standard governor for single-flow machines. Its most important feature is that all parts are kept constantly in motion so as to avoid "friction of rest" and prevent sluggish action, which would otherwise ensue after running a considerable period at constant load. A small relay steam piston does the actual work of moving the turbine valves, thus relieving the governor of practically all work except moving a small pilot valve. For convenience in synchronizing and in distribution of alternating-current load, the governor is fitted with a small motor and weight, by which the governor spring tension may be controlled from a distance—usually from the switchboard.

PLATFORM GATE FOR PAY-AS-YOU-ENTER CARS.

Harry M. Sloan, general manager of the Calumet Electric Street Railway of Chicago, has applied for patents on two forms of gate for use in connection with the pay-as-you-enter method of fare collection which are designed to facilitate the operation of the pay-as-you-enter system and to prevent platform accidents.

The first form, which is illustrated in the accompanying drawing, consists of a pair of gates, opening outward and



Double Platform Gate for Pay-As-You-Enter Car.

closing the exit side of the platform step, which may be operated either by a foot crank or by a lever. This gate could be readily adopted for use on the present type of pay-as-you-enter car used in Chicago, New York and Buffalo. The object of the gate is to direct passengers boarding the car to the entrance side of the platform and, as the gate will be closed until the car stops, to prevent passengers, especially ladies, from getting off before the car comes to a stop.

Mr. Sloan has also applied for a patent on a single gate, opening inward and closing the platform exit. This would serve the same purpose as the double gate as regards passengers boarding or leaving the car and when opened would completely separate the entrance and exit sides of the platform.

TOLEDO MEETING OF THE CENTRAL ELECTRIC RAILWAY ASSOCIATION.

The regular bi-monthly meeting of the Central Electric Railway Association was held at the Boody house, Toledo, O., on Tuesday of this week. President F. D. Carpenter presided and about 75 members were in attendance.

Committee on Rules.

After reading the minutes of the March meeting the committee on "Uniform Rules" was called on for a report. The committee reported that it had drafted a set of rules which met with the approval of the Indiana railroad commission and that copies of these rules had been sent to all electric roads in Indiana for their criticisms. At some later date a conference with the railroad commissioners will be held, at which the criticisms received will be considered and final action taken on the adoption of the rules as standard. The report was received and the committee continued.

Committee on Claims.

The committee on "Claims" appointed at the March meeting made the following recommendations, which were adopted by the association:

That cards be printed, for the use of the various companies, showing the name, residence and a short personal description of each claimant, together with the name of his attorney and attending physician; where the amount of the claim is $100 or over and in other cases if there should be any reason to think that they should be reported; the claim departments of the various companies to forward these cards to the secretary of the Central Electric Railway Association, to be kept on file in his office, in this way having a complete record of all the important claimants against all of the companies of the association.

When a claim is made against any company about which information is desired, the company against which the claim is made will at once communicate with the secretary of the Central Electric Railway Association, asking for information regarding the particular claimant. If there is any record of the claimant on file, then the secretary will immediately notify the inquiring company of whom to make additional inquiry for specific information.

In filing reports of cases, should the secretary find that he has more than one report upon a particular person with the same or similar name, even though inquiry has not been made regarding this person, he will immediately notify each company making report upon the same person, thus giving each company that has any record regarding the claimant the benefit of the information that he has a claim against whatever companies have reported. This will, in effect, make the secretary's office a clearing house for information regarding claimants, and the more complete his records can be made the more benefit it will be for all parties concerned.

We further recommend that this plan be enlarged upon by permitting other companies that may desire, which are not members of the Central Electric Railway Association, to become associate members for the purpose of reporting and securing information regarding claims and claimants. A small fee should be paid by the associate members to cover express incident to this work.

We would further recommend that the claim department of each company, as soon as possible, make report to the secretary upon cards to be furnished by him of all claimants since January 1, 1907, and that the secretary be instructed to provide a sufficient number of cards and filing cases for this purpose.

Committee on Interchangeable Mileage Books.

The committee appointed to report on a new form of interchangeable coupon mileage book presented a form of contract covering the settlement between roads and the conditions of sale and use of a new book containing 1,000 miles of coupons to be sold at $17.50 or $1\frac{3}{4}$ cents per mile. The territory of the association now includes 8,800 miles of interurban roads, which if they subscribe to the contract presented would honor the book on any regular passenger car. The new book will be good for bearer or bearer and party. It will be limited to one year from date of sale. All detachments of coupons will be subject to local regulations of the road on which used as well as all local bridge and terminal arbitraries. No detachment will be made for less than five miles or for half-fare tickets. No portion of the mileage strip will be honored if detached from the cover. If baggage is checked for more than one person no more baggage will be checked until the passage coupons with baggage strip detached are all used up. Redemption of the unused portion of the ticket will be made on the basis of two cents per mile for the part used. When two or more persons ride on one ticket the conductor will detach one strip for the total mileage and indorse on the back thereof the place from and to and the number of passengers.

The association adopted the recommendation of the committee for the issuance of the new book to take the place of the old Central Electric mileage book and continued the committee with instructions to co-operate with the chairman of the Traffic Association in deciding on the details of the style and color of mileage strip and cover to be used.

Insulation of High-Tension Transmission Lines.

A paper on "Insulation of High-Tension Transmission Lines," by Francis S. Denneen of the Ohio Brass Company, Mansfield, O., was read by abstract. This paper will be found elsewhere in this issue.

G. H. Kelsay (Indiana Union Traction Company) asked Mr. Denneen if he would specify the same insulator where iron pins, crossarms or poles are used as for wood pins and poles. He had had some trouble with porcelain insulators puncturing under the wire and discharge through the core to the pin. With wood pins this discharge continues until the pin, the crossarm or the pole is burned away, thus showing up the defect to an inspector. He asked if a puncture occurred with a metal pin what visible evidence of failure might be expected.

Mr. Denneen replied that punctures with porcelain insulators were rare failures and that with iron pins the discharge would probably be so heavy that the heat generated would burst the insulator or at least crack off a piece large enough to be detected. The usual result of a heavy discharge is to run down the outside and shatter the insulator. He explained the cause of punctures by stating that the dielectric material, of which the insulator was composed, had a certain resistance to sudden rises of potential or, in other words, a capacity to resist blows. Its resistance to slower rises of potential was much greater. When the wave of current had a sharp peak the dielectric could not adjust itself quick enough to prevent breakdown but when the rise of potential was slow failure occurred by flashing over.

A member called attention to the fact that while with Y connections and grounded neutrals the failure of one insulator would cause heavy discharge to ground, with delta connections the failure of one insulator would not result in a ground but only in increasng the static discharge from insulators of the other two wires.

Afternoon Session—Merit System of Discipline.

The first paper of the afternoon session was on "The Merit System of Discipline," by Frank Hardy, division superintendent Ft. Wayne & Wabash Valley Traction Company, Huntington, Ind. An abstract of this paper will be found in another column.

L. K. Burge, superintendent Lake Shore Electric, asked how much time was required to keep up employes' records in the complete form outlined in the paper.

Mr. Hardy replied that while it required some additional clerical work and the time of the officers sitting on the merit board, the results more than justified the expenditure of time and money. The work of the board has been systematized and no time is spent in discussions of hypothetical cases. The board considers only statements of facts and its records are kept by a simple code indicating the nature of the offense or meritorious act and the number of points awarded. Meetings of the board seldom last over two hours and the minutes

are recorded in full by a stenographer who acts as secretary. About 250 employes are now working under the system. When a case is presented against an employe he does not appear before the board in person; appeals from the decisions of the board are made in writing and all communications are submitted in writing to be made part of the record of the case.

W. R. W. Griffin, general superintendent Rochester (N. Y.) Railway Company, described the working of the merit system on his road which employs 1,100 men, all members of the union. The system has been in effect more than three years and in that time a very complete schedule of specific penalties for specific acts has been worked up. All reports of infractions of the rules are made to the superintendent of transportation who passes on them and determines the number of demerits. A letter is sent to the employe who has been given demerits and he is required to acknowledge receipt of it on an acknowledgment stub attached. He is allowed 10 days in which to file notice of appeal in writing. If an appeal is filed the company makes a complete investigation of all of the facts and sustains or rejects the appeal on the evidence. All cases of appeals are handled through the business agent of the union and not directly with employes. Only cases involving discharge as a penalty are ever carried beyond the superintendent of transportation to the general superintendent and notice of discharge is sent through the executive board of the union. All records are kept in minute detail and every paper having any bearing on a case is entered in the file covering the record of the employe involved. For these files large envelopes in vertical filing cases are used. An abstract of all records is also kept in a loose leaf ledger. At the end of each month a bulletin is posted giving the number and causes of all merits and demerits earned during that month but without details which would identify any employe. At the end of every six months all accounts are balanced. If not more than five demerits have been charged against him in that time the employe is given a clean record, which carries with it 15 merit marks, canceling as many demerits which may have been carried over from the previous six months. A total of 60 demerits is cause for discharge. Some of the older employes now have as high as 250 merits to their credit. The men watch their records closely and apparently make an earnest effort to have a clean record. No money prizes are given for good records. The schedule of penalties has been printed in pamphlet form, to be pasted in the men's rule books so that they have before them a constant reminder of the result of disobedience. The system of keeping the records requires the services of one clerk and an assistant but there is a decided saving in the time of the officers of the company, who are never involved in the settlement of disputes.

Mr. Hardy said that when the system was introduced on the Ft. Wayne & Wabash Valley the men did not seem to take much interest in it for the first two or three months, but after a few demerit marks had been given they began to evince a keen interest, and now every man asks to examine his record on an average of about every three weeks. The essential thing to remember in putting such a system into effect is that the officers must be constantly on the lookout not only for violations of the rules but for meritorious acts as well.

Standardization Committee.

The "Standardization" committee held a meeting at Toledo on May 26, at which were present R. C. Taylor, Fred Heckler, M. Baxter; and absent Mr. Gibbs, Mr. Townsend and Mr. Clark. It was the opinion of the members present that this committee should be enlarged, as it has been difficult in the past to get a majority of the committee together and in consequence the work of the committee during the current year has not been as effective as it should have been. The committee therefore suggested that the following members be added: Ira Schofield, Toledo & Western Railway; W. C. Ralston, Cleveland Southwestern & Columbus Railway; Lee Jacques, Ft. Wayne & Wabash Valley Traction Company; H. D. Murdock, Indianapolis & Louisville Traction Company.

In order to facilitate the work of this committee it was further decided to hold regular meetings on the third Wednesday of each month alternately at the nearest accessible location to the cities at which the various members of the committee are located.

It is urged on the managers to see that their subordinates interested in this work attend every one of these meetings, as the work accomplished in the past and the still greater work to do is of sufficient importance to warrant the most earnest and persistent work on the part of all the members of the committee.

It was further decided by the members of the committee present that the next subjects for consideration and recommendation should be:

(a) Standard height of drawbar for interurban cars.

(b) Standard form of car coupler.

These two subjects require also the settlement of standard height of car floor and standard height of bumper.

The committee has in its possession and has examined drawings submitted by the McConway & Torley Company, Pittsburg; W. T. Van Dorn Company, Chicago; the Ohio Brass Company and the Edwin C. Washburn Company, Minneapolis.

There is also a modification of the M. C. B. coupler being developed by Mr. Gibbs, one of the members of the committee, and it has been decided before making definite recommendations as to a standard form of car coupler for interurban cars to issue a data sheet to the members of the association to be filled in and sent to the committee. It is hoped that a ready and prompt response will be made to these inquiries. When this information has been received and tabulated an opportunity will be given the manufacturers to present the merits of their couplers to the committee. It is the wish of the members of the committee present to solicit the hearty cooperation of the members of the association in its work, which is of such far-reaching importance to the association.

The report of the committee was received and approved, the president announcing that he would formally appoint the new members suggested. In commenting on the work before the "Standardization" committee, President Carpenter laid particular stress on the need of standardization of those parts and dimensions affecting interchange of equipment. He pointed out that the steam roads had standardized their equipment to such an extent that a car of one road could be run over any other road and he thought it was only a question of a short time before the interurban lines would have to arrange to haul through passengers in trailers which could be turned over from one road to another at connecting points.

The papers by John F. Ohmer, president of the Ohmer Fare Register Company, Dayton, O., on "Tickets as a Fare Medium for Street and Interurban Railway Traffic," and by H. E. Vordermark, auditor of the Ft. Wayne & Wabash Valley Traction Company of Ft. Wayne, Ind., on "Employes' Mutual Benefit Association," were read but not discussed. Abstracts of both are printed in another column.

It was announced that the following roads had subscribed to the agreement of the Central Electric Traffic Association, effective on June 1: Western Ohio Railway, Columbus Delaware & Marion Railway, Columbus Marion & Bucyrus Railway, Indiana Union Traction Company, Chicago South Bend & Northern Indiana Railway, Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne & Springfield Railway.

The following new members were elected: Charles H. Hubbell, acting auditor Toledo & Chicago Interurban Railway Company; A. J. Purinton, general manager Toledo & Chicago Interurban Railway Company; George S. Henry, traffic manager Indianapolis & Cincinnati Traction Company; G. F. Faber, general superintendent Western Ohio Railway Company; W. K.

Morley, general manager Grand Rapids Grand Haven & Muskegon Railway Company; E. B. Lincoln, general manager Muncie & Portland Traction Company; Stanley W. Midgeley, Curtain Supply Company, Chicago; Charles E. Sawtelle, Tool Steel Motor Gear & Pinion Company, Cincinnati, O.; T. J. Hayden, Rand-McNally Company, Chicago; A. E. Duclose, Massachusetts Chemical Company, Chicago.

The next meeting will be held in Indianapolis on September 24.

EMPLOYES' MUTUAL BENEFIT ASSOCIATION OF THE FT. WAYNE & WABASH VALLEY TRACTION COMPANY.*

BY H. E. VORDERMARK, AUDITOR.

The idea of a relief department or a mutual benefit association among employes is not a new one, as such organizations have been in existence for a score or more of years on various railway systems, particularly the Pennsylvania and the Baltimore & Ohio.

Their first organization was induced by the necessity of some relief for the unfortunate employe whose ability to earn his usual wages had been temporarily interfered with because of accident or illness. The old and still much used method of providing such relief by "passing around the hat" is not only embarrassing to the employe for whom the solicitation is made, but a very great burden upon his friends, who feel from sheer necessity the call to take upon themselves the burden of collecting funds for the need of their sick friend and those dependent upon him. Not only does the burden of taking up a collection for the relief of those needing it fall upon their friends, but the more or less frequent contributions are gathered from the few who are charitably inclined, so that the tendency is to cause them to have to decline the aid from time to time that they would like to give, with the result that this method of providing relief becomes more and more of a failure and the one in need actually suffers.

Having observed for nine years the beneficial advantages of the relief department of the Pennsylvania Railroad, and being convinced as to its practicability and usefulness, the general manager of the Ft. Wayne & Wabash Valley Traction Company introduced the subject at one of the meetings of its Officers' Association, the result being that a committee of three of the Officers' Association, of which the writer was chairman, was appointed to study the various forms of relief departments and benefit associations in operation not only on steam railroad properties, but also on electric properties, and to formulate recommendations looking to the establishment of such an association on the lines of the Ft. Wayne & Wabash Valley Traction Company.

The committee collected data from every street railway company in the United States and Canada who had an organization of this kind among their employes, also from the Pennsylvania Railroad and the Baltimore & Ohio Railroad. We found a great variation, not only in monthly dues to be paid and benefits to be derived, but also as to the method of collecting dues and management of the association. The result of the study of this committee was to unanimously recommend such an organization, and in order to start it a charter paper was gotten up, as follows:

"Whereas, the employes of the Ft. Wayne & Wabash Valley Traction Company are about to organize an Employes' Mutual Benefit Association, the object of which shall be the relief of its members in case of sickness, injury or disability, and in case of death the payment of definite amounts to beneficiaries and also to promote social relations and goodfellowship among its members; and

"Whereas, the Ft. Wayne & Wabash Valley Traction Company, to further the interests of said Employes' Mutual Benefit Association, has set aside the sum of $..... as voluntary contributions toward this cause, and does propose to further aid the same from time to time as it may become necessary, and also further proposes to have its officers and accountants devote such time, at the expense of the company, as may be necessary to conduct the business of said Employes' Mutual Benefit Association without further expense to the association; and

"Whereas, it is proposed that prior to a definite organization a full list of 200 employes shall have subscribed to the constitution and agreements attached hereto and thereby become charter members of this organization;

"Therefore, we, the undersigned officers and employes of the Ft. Wayne & Wabash Valley Traction Company, hereby subscribe our several individual names, as charter members, for the purpose of organizing the Employes' Mutual Benefit Association of the Ft. Wayne & Wabash Valley Traction Company, and upon the signature of 200 of such officers and employes to have it understood and known that we are thereafter organized as members of the Employes' Mutual Benefit Association of the Ft. Wayne & Wabash Valley Traction Company, and agree to abide by the constitution and by-laws appended hereto and made part of this proposal."

This paper was started for signature among the employes about June 1, 1907, and the date of October 1 was fixed for the time of closing the charter paper and starting the association. At this time 340 names had been signed to the charter paper and the association thus fairly launched.

The management of the affairs of the association was vested in a board of trustees, which consisted of a chairman and six members. The president of the association shall be chairman of the board of trustees and appoint three members of the board from the Officers' Association of the Ft. Wayne & Wabash Valley Traction Company. The other three members of the board are chosen annually in the month of November, by ballot, to serve one year from the first day of January next succeeding, and are elected from the members of the relief association.

The general manager of the company is ex-officio president of the association, and our present board consists of a conductor representing the Ft. Wayne city division, a motorman representing the interurban division and a motorman representing the Lafayette division in addition to the general manager and three members of the Officers' Association. It is proposed to increase this board to 11, giving additional departments additional representation on the board.

After a great deal of study on the part of the committee in reference to dues and benefits, it was deemed advisable to be conservative in this respect, the result being the dues were fixed at 50 cents per month, with benefits of 75 cents for each day, when disabled by accident, limiting the period of disablement to 120 days in any one year, and 50 cents for each day when disabled by sickness, after the first seven days, and for a period not exceeding 120 days in any one year, a payment of $100 to person or persons designated in application for membership to receive the same, in case of death. These dues are paid in advance and are deducted from the last pay check of each month, so that there is not the embarrassment or trouble of making collections from the men, as is usual in such cases.

The membership is limited to employes of the Ft. Wayne & Wabash Valley Traction Company over 16 years of age and under 45 years of age, both inclusive, who shall have been in the service of said company for at least one month.

The entire management of the association is in the hands of the board of trustees, which meets regularly on the second Monday of each month, and whose officers are a president, vice-president, treasurer and secretary.

No meetings of the members of the association itself are deemed advisable, on account of the membership being so widely scattered along the lines of the Ft. Wayne & Wabash Valley Traction Company, over 200 miles in extent, and not only being impracticable, but such meetings were deemed inadvisable.

It is the intention of the company that every cent that is paid into the association on account of dues shall be expended on account of relief in sick, accident and death benefits, so there are no charges made against the association for clerical services, printing and supplies, or wages of men who have been relieved to attend meetings of the trustees.

In addition to this relief work, and in connection with the association, reading, card and pool rooms have been established at division points—at Ft. Wayne, Huntington, Logansport and Lafayette—to which rooms all of the members of the association are cordially invited and welcomed, and which are always occupied and seemingly appreciated.

In addition to monthly magazines, which are subscribed for by the company, a library has been started, which at the present time consists of about 260 volumes.

The association having been started October last has been in effect but about eight months and its membership has increased from 340 to 500 members, and the association has paid out in the eight months of operation about $900 for sick, accident and death benefits.

We are pleased to submit for your consideration some forms of blanks which are in use in connection with this association as follows: Preliminary notice of application for membership; application for membership; notice of rejection; notice of election to membership; member's certificate book, containing constitution and by-laws of the association; preliminary notice of disablement; disablement notice; certificate of attending physician; return to duty card; data for death benefit; release on account of death benefit.

*Paper read before the Central Electric Railway Association at Toledo, O., May 26, 1908.

INSULATION OF HIGH-TENSION TRANSMISSION LINES.*

BY FRANCIS S. DENNEEN, OHIO BRASS COMPANY.

The general problem of high-tension line insulation is too broad and complex to permit a thorough and exhaustive treatment within the limited scope of this discussion. The effort, therefore, will be to touch on those points of particular moment in the selection of line insulators, and to discuss briefly the performance of insulators in service and the elements to be considered in the design.

About 18 years ago the first alternating-current power transmission line in the United States was put in operation, the voltage being 3,000, and a small glass insulator about three inches in diameter and 4 inches high, made along the lines of the present standard type deep-groove telegraph insulator, served for carrying the wires. At the time much comment was made by engineers, who stated that the line could not possibly operate with this insulation. However, it continued in successful service for more than six years with practically no insulator troubles. During the ensuing six or seven years, line voltages were gradually increased, and in 1897 we had transmissions in the United States operating at 16,000 volts, and up to this time glass was used almost exclusively for the insulation. Some porcelain insulators were used, but these were made by the so-called dry process, in which the clay, but slightly moistened, is pressed to shape in iron or steel moulds, after which it is glazed and subjected to the firing process. These insulators gave trouble because they punctured quite readily, and it was then realized that the major part of the insulation was being offered by the glaze, the body portion having comparatively small insulating value on the higher voltages.

Investigation showed that this early porcelain was porous and would absorb moisture very rapidly at points where the glaze was removed. A close study of the subject disclosed the fact that the body was not sufficiently dense and vitrified. The pieces were then made by the "wet process," which will be described briefly hereafter. By this method of manufacture and with the proper mix of the materials making up the porcelain body, it was possible to produce porcelain of great mechanical and electrical strength, the body being dense and homogeneous and highly vitrified. As the operating voltages increased, it was found necessary to make the insulators with two or more shells glazed or cemented together, in order to keep the thickness of the parts within limits which would permit making the body sufficiently dense and at the same time prevent excessive manufacturing losses from cracking and other causes. With the increasing line voltages numerous designs, more or less complicated, were introduced and tried out, but most of these early types have been entirely discarded and replaced by simpler ones, designed to meet the operating requirements and yet in such a way as to permit economical manufacture.

At the present time glass and porcelain are the only materials used commercially for the insulation of high-tension lines, and the former is fast becoming limited to use on lines where the pressure does not exceed 10,000 to 15,000 volts. In the earlier years of electric power transmission, the difficulty and expense of manufacturing porcelain of the requisite electrical strength caused glass to be used almost exclusively. The great improvement in the methods of porcelain manufacture for this work, however, has entirely changed the situation, and today very few engineers are willing to risk using glass at voltages above the limits just named.

Perhaps the greatest advantage offered by porcelain is its mechanical strength. These porcelain pieces are made so that they are not under any internal stresses, and a shell of moderate weight will stand a great deal of abuse without breaking. In order to get a fairly clear idea of the nature of the porcelain which is used for high-tension insulator work, it might be well at this point to give a brief description of the various processes involved in the manufacture of this ware.

Manufacture of Porcelain Insulators.

The exact composition of the porcelain body is closely guarded by the manufacturers, but in general it consists of special clays with feldspar and ground flint in proportions which have been determined by experiment to give the most satisfactory results. This mixture is ground very fine in the presence of water to obtain a thorough mixture, after which the excess water is removed by means of filter presses. The "clay," as it is called, is then worked in kneading machinery until a uniformly plastic mass is obtained. By means of a large press the clay is forced into a continuous cylindrical piece about 6 inches in diameter. This piece is cut up into suitable lengths and stored until needed.

The moist clay is placed in a revolvable mold, which forms the outer surface of the piece, and the inner contour is given by a steel knife or profile, as it is called, attached to the lever used in forcing the clay into the mold as it revolves. The molds are made from plaster of paris, and as soon as the piece has been formed the mold containing it is removed from the revolving table and placed in the "hot room," where it is kept at about 125 degrees F. for several hours. The porous plaster mold rapidly absorbs the moisture from the formed piece of clay, and the clay at the same time shrinks very rapidly, this shrinkage being such that the mold has to be about 15 per cent larger than the finished article desired. After the piece has dried a few hours, it is removed from the mold and placed in a drying rack, where it remains for several days, until all moisture has been dried out. The piece is then dipped in a liquid glaze, after which it is placed in the kiln to be burned. The surfaces upon which the pieces rest in burning are left unglazed, for otherwise these surfaces would stick to the surface supporting them during the burning process. On being removed from the kiln, the pieces are carefully inspected for mechanical defects of any sort, and any having checks or cracks or showing mechanical defects in any way affecting the insulator are thrown out. All parts are then subjected to a severe electrical test. If the insulators are single-piece, this test may be more than twice the rated line voltage.

Pieces from various parts of the kiln are broken and carefully tested for absorption. This is to insure against the possibility of any ware going out which is not thoroughly vitrified. The final check on this, of course, is the electrical test given later. The parts which have passed inspection and electrical test are then assembled with the best obtainable grade of neat Portland cement, and the assembled insulator is allowed to set undisturbed for several days. The insulators are once more placed in the testing racks, and subjected to an assembled test voltage of at least double the rated line voltage, and this serves as a final check on the electrical value of the insulator. The insulators are then sent to the storerooms, or shipping rooms, and every one is subjected to a final inspection for mechanical defects before it is packed.

The glaze of a porcelain insulator is a very important feature, not because it is depended upon for actual insulation, but because it serves to give the porcelain body a surface which will be non-hygroscopic and absolutely smooth, so as not to retain dust or moisture readily. White glaze was first used for porcelain insulators, but it was found that these were too attractive as targets for the hunter and the small boy, and a dark brown has now become standard with most users.

Action of an Insulator Under Stress.

Before discussing the theory of insulator design and the performance of an insulator in service, it would be well to devote a few moments to a brief study of the action of an insulator or dielectric when subject to electrical stress. The study must not be limited to the insulator alone, for it should involve a consideration of all of the effects of electrical tension upon the dielectric near the conductors. With an insulator, air is always a dielectric in combination with glass or porcelain or other insulating materials. When a difference of electrical potential exists, a condition of strain is produced in the surrounding media and this is called the electrostatic field. This electro-static field is produced by applying electrical stress to the insulating medium. When subject to electrical tension all dielectrics, including air, glass, porcelain, wood, etc., have produced in them a displacement in the molecular structure which, if the applied potential is carried to a sufficiently high value, results in a disruptive breakdown of the material. Before a difference of potential can exist, current must flow into the dielectric, and if the potential is not raised to a value which will cause rupture, current will flow from the dielectric whenever the tension is reduced or removed, and a path formed for this current to flow in.

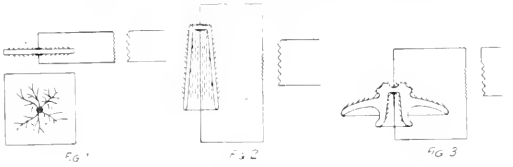
All dielectrics are capable of receiving strain to a certain point without rupture, and solids such as glass and porcelain possess this feature to a greater extent than air or gases. Generally, whenever the potential is brought to a sufficiently high value, there is a structural failure of the dielectric, solids failing by mechanical rupture and gases by a change in the molecular state, which partially destroys their insulating qualities and makes them semi-conducting. An insulator under heavy load may show brush discharge, which is an indication that while the insulator remains intact, the dielectric surrounding it (the air) has broken down. The dielectric strength of air plays an important part in the design of an insulator, for it is well known that under ordinary temperatures and pressures, this value is much below that of most solid insulating materials.

With the foregoing facts in mind, let us consider the

*Abstract of paper read before the Central Electric Railway Association at Toledo, O., May 26, 1908.

effect of an electrical charge on a few elementary forms of insulators. In Figure 1 is shown a thin plate or disc of insulating material such as glass, having on each face a small terminal connected to a source of E. M. F. Starting with a low potential, only current to charge this small condenser will flow, but as the potential is raised the air in the vicinity of the electrodes breaks down, producing a brush discharge, which has the effect of increasing the size of the electrodes. As the tension is further increased, the zone of ionized or broken-down air spreads over the surface of the plate and finally streamers form across the surface, aiding in breaking down the air further from the electrodes. If the voltage is sufficiently increased, this process continues until the streamers unite around the edges, forming a short-circuit, or puncture of the plate occurs. It must be borne in mind that this is not the result of surface leakage but of breaking down of the film of air next to the insulator. Once the air has become ruptured, the spreading of the streamers will be affected to a certain degree by the shape and dimensions of the solid dielectric.

In Figure 2, for instance, if the potential is carried sufficiently high, the air within the chamber breaks down and



High-Tension Insulators—Figures 1, 2 and 3.

the effect is the same as if the chamber were filled with a conducting fluid.

In Figure 3 appears an insulator head and under such a test the streamers would start at first the same as in Figure 1, but upon reaching the downward projection they are forced away from the streamers on the top surface until a point is reached where the electro-static field is no longer strong enough to break down the air, and the streamers die out and further rupture of the air adjacent to the insulator ceases.

With these points in mind it is a comparatively simple matter to follow out in detail the action of a regular insulator under varying load conditions. Surface insulation has little to do with insulator performance and the actual leakage over the insulator will be inappreciable unless the surface is covered with dust or water or some other foreign substance. Under high potentials, the wet surface should be considered as a conductor, while the dry surface should be regarded only in relation to the electro-static effects described. (Mr. M. H. Gerry, Jr., discussed this feature in detail in a paper presented at the Electrical Congress at St. Louis in 1904.)

Let us now consider the action of an ordinary insulator under varying service conditions. Assume that the one appearing in Figure 4 is operating at its normal line voltage and that all surfaces are dry and clean. If properly designed for this voltage, the electro-static field about the different shells will be too weak to break down the air, hence no brush discharge or "static" will be in evidence. Let the potential be increased and as the electro-static field becomes more intense the air fails and brush discharge is seen around the different shells near the conductors, and at the cemented portions. As the potential is raised, streamers form, further increasing the zone of ruptured air until the air near the shells becomes sufficiently conducting that an arc forms from shell to shell and finally from the pin to the wire, the arc straightening out to nearly the shortest distance between them, but around the edges of the shells. This, of course, assumes that the insulator is sufficiently strong to withstand the flashing-over voltage without puncturing.

Let us now study the same insulator under heavy rainstorm conditions. The entire top surface at once becomes wet and the potential of the line is immediately carried to the outer rim of this piece. Some of the rain beats against the lower shells, wetting them, not only where it strikes but on the under surface of the upper shells, due to spattering, the amount of surface so acted upon depending upon the force and angularity with which the rain is driven and upon the design of the shells. Under a severe storm it is quite possible for practically all of the insulator surfaces to become wet and conducting, except possibly the under surface of the center or bottom shell. If the insulator is properly mounted with respect to the crossarm, and the center shell is correctly formed, this inner surface will remain dry. In the meantime, the line potential has followed the wet surfaces of the insulator until it has reached the bottom edge E of the center shell, so that the full line potential is now being carried by the center shell alone.

The insulator can now fail in either of two ways: (a) by rupture of the air film adjacent to the inner surface, because of the intense electro-static field, resulting in an arc from the shell to the pin, or (b) by puncture of the shell itself. In case of the formation of an arc, the actual current flowing would be of low value, because of the high resistance of the thin film of pure water forming the conducting surface over the insulator, and this would at once result in a drying action due to the heat from the current. As this drying process continues, the resistance becomes too high to permit maintaining the arc, and the discharge between line and pin ceases. It is interesting to note that the drying action is maximum at the neck of the smallest shell, for here the current density is highest and therefore the heating effect is greatest.

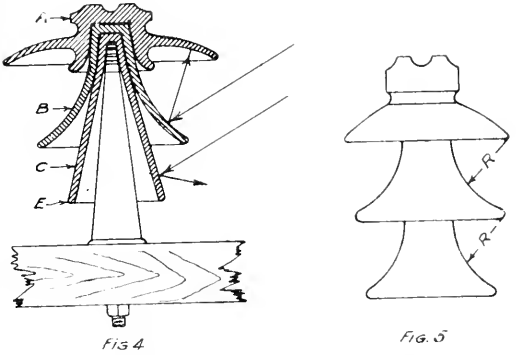
From the foregoing it is evident that the behavior of an insulator under severe weather conditions is of chief concern, and its ability to maintain dry surface under the most trying conditions is a direct measure of its value as an insulator.

The contour of the different pieces has much to do with the wetting of the shells in a storm. The shape of a shell may be such as to deflect the air currents, thereby carrying the rain up into recesses which would otherwise be dry. The flare of the skirt portion of the shells also plays an important part. Referring to Figure 4, the second shell B is flared or curved outward at the bottom, and in a driving rain the drops will be deflected against the underside of the top portion, as shown by the arrows, because of the curved surface. The third shell, C, however, is straight, and as the arrows ndicate, the rain drops are deflected downward so that the shell above is not spattered.

There are other features which enter into the question of design, however, which make the curved shell particularly advantageous, and it is therefore necessary to regard these different points of merit of the two types carefully in making a choice for any particular design. With a given diameter and height, maximum sparking distances between the rim and shell of the adjacent parts can be obtained by using the curved type of shell, but there is a point where this advantage is lost because of spattering the other shells, as already described.

Protection from Lightning.

Of considerable importance in connection with the selection of insulators is the question of disturbances from lightning. The scope of this paper is too limited to any more than



High-Tension Insulators—Figures 4 and 5.

touch upon this subject, but in passing, it might be well to call attention to the necessity of considering lightning as one of the things to be provided against in determining upon the line insulation. By lightning we mean not only the electrical disturbance produced by atmospheric electricity in discharging from cloud to cloud or from cloud to ground, but also the numerous internal disturbances, such as surges, producing extreme potential rises, within the transmission system itself, independent of atmospheric electrical disturbances.

The pressure of the total electric circuit may gradually rise by an electric charge accumulating in the circuit until the pressure between the line and the ground is greatly in excess of the normal potential between two conductors or between any one conductor and the ground. Such a rise in pressure may be due to the collecton of a static charge from rain or snow carried by the wind across the line. It could

also be due to electro-static induction from a passing cloud, that is, a charged cloud passing over the transmission line. In explanation, as a positively charged cloud passes over the line, the ground underneath has a corresponding negative charge, and if the line were not insulated from the ground it also would be negatively charged, but at a potential slightly above that of the ground. Being thoroughly insulated, however, it may have practically the cloud potential. As a positively charged thunder cloud approaches the transmission line, the positive charge of the line against the ground rises until a discharge takes place from the ground to the line charging the line negatively. As the cloud recedes, the line remains negatively charged, this charge being bound by the positive charge of the cloud, and when the cloud recedes or discharges to the ground this bound charge is released and discharge then takes place from line to ground. If the transmission line is not protected by efficient lightning arresters or shielded by grounded wires, the insulation is bound to be subjected to such severe strains as just described. If the discharge between line and ground takes place across an insulator, it is quite possible that the line current will follow, resulting in a complete shattering of the insulator, with the consequent service interruption.

Lightning troubles are not so marked on lines operating at voltages below 30,000, undoubtedly because the insulation of these lines does not need to be nearly so perfect as for operating voltages of 50,000 or 60,000. With the moderate insulation required for 30,000 volts or less, the loss of a static charge from the line would be rapid and this charge would not be built up to excessive values before arcing around the insulator would produce relief in the line. At the same time the line potential would not be high enough to cause the line current to follow when discharge from line to pin occurs. Numerous methods have been devised and tried out for protecting the high-tension lines against atmospheric electrical disturbances, among which are included various types of lightning arresters and different schemes for shielding the lines by means of lightning rods on the poles and wires strung parallel to the lines and grounded at frequent intervals. This subject has been given considerable thought and study during the past two or three years, and from various reports submitted by those who have carefully watched the operation of the different devices it would seem that the use of grounded wires placed above the transmission lines greatly minimize insulator troubles from lightning. (Note.—In the May, 1908,

Insulator Pins.

The question of insulator pins has long been an unsettled one, many engineers still maintaining that nothing but the wood pin should be used, while others insist upon a metal pin. For low-voltage lines, where the insulators are small and the spans comparatively short, bringing light mechanical loads upon the pins, a good quality locust or oak pin thoroughly treated with oil or paraffine meets all requirements cheaply and effectively. It must, of course, be remembered that to get satisfactory service from a wood insulator pin the design of the insulator itself must be such as to insure against burning the pin from brush discharge or leakage. For insulators of the larger type, where the pin must extend a considerable distance above the crossarm, thereby placing a more severe load upon the pin, and where this load is further increased because of the use of longer spans, a metal pin should by all means be employed.

Many advocates of the wood pin hold that the electro-static stress placed upon the insulator when used with an iron pin is much greater than it would be if a wood pin were used. This means that the insulator would be more liable to break down or flash over under excessive voltage variations than if mounted upon a wood pin. It is quite true that the wood pin possesses, for a time, certain insulating qualities, but this is not of any considerable value with the higher voltages, say 33,000 and more, particularly after the pin has become old and to a certain extent coated over with dust.

A thoroughly insulating pin would indeed be ideal, for with it the thickness of the dielectric would be considerably increased, thereby greatly decreasing the strength of the electro-static field about the insulator, hence increasing the factor of safety. This would mean that the air adjacent to the insulator would not become ionized, and there would be no brush discharge. However, such a pin cannot at the present time be made, because of the mechanical difficulties involved. Unfortunately we have no suitable insulating material of sufficient mechanical strength to meet this class of service.

The transmission line has in many cases been hampered by the desire of the engineer to introduce some more or less new and original ideas, putting, as it were, his personal stamp upon the line. It is, of course, true that in the early days of porcelain insulator manufacture the maker did only what the engineer desired, but as soon as the demand for insulators warranted, the manufacturer at once placed himself in a position to design insulating devices and equipped himself with everything necessary for the study of insulation problems. The result is that today the modern high-tension insulator factory, because of its experience and facilities for investigation, is far better equipped to design insulators for a given service than the average engineer who has had but little experience in this class of work.

In drawing the specifications for insulators, points often come up which make a proposition unnecessarily difficult and expensive for both the purchaser and the manufacturer, and this condition could often be prevented if the manufacturer were given a full understanding of the actual requirements and not hampered by more or less foolish specifications which the engineer, when he drew them up, knew could not be met.

The following suggestions to aid in drawing insulator specifications are being offered with an idea of making them cover all general insulator requirements. These specifications are made so that they can be commercially met by the manufacturer and at the same time insulators made in strict accordance with them should fulfill the requirements perfectly under all ordinary conditions.

Suggestions for Insulator Specifications.

Insulators should be made of a grade of dense porcelain best suited for high-tension insulators and the burning should be so done as to insure thorough vitrification of the pieces without overfiring.

The porcelain body should be practically non-absorbent and pieces broken from any insulator should not show an absorption in excess of one-tenth of 1 per cent. The absorption test should be made by thoroughly drying the pieces in an oven before the first weighing; they should then be immersed in water for 48 hours, after which all surfaces should be carefully dried and a second weighing made. The increase in weight expressed as a percentage of the original weight will show the absorption.

All insulators should be given a dark-brown glaze (or other color required) on all exposed surfaces. Those surfaces which are cemented together and those upon which the insulator rests in burning not to be glazed. The pinhole should be left unglazed if the insulator is to be cemented to an iron pin.

All cemented joints should be carefully made with neat Portland cement of the best quality and the assembly should be so done as to leave no hollow spaces or voids between the cemented surfaces. In assembling, the cement should be mixed only as needed and in the portions of 80 per cent cement and 20 per cent water, and no cement which has been mixed for more than 30 minutes should be used. The assembling should be so done as to bring all of the various parts in correct alignment.

All parts should be carefully inspected as they come from the kilns and any which are chipped or cracked, particularly at the surface where the cells are cemented together, should be discarded. Badly warped or distorted pieces and those having checks of appreciable depth at any points on the surface should be rejected.

All parts should be tested for one minute at full line potential except in cases where the design of the piece will not permit reaching this voltage without flashing over. In such cases the test voltage should be within 5,000 volts of the flash-over value.

Each assembled insulator should be tested to at least double the full line voltage for a period of not less than three minutes.

The insulator should be capable of withstanding a rain test at twice the operating voltage for a period of 10 minutes without flashing over or injury to the insulator, the precipitation being at the rate of 1¼ inches in five minutes and directed against the insulator in a fine spray at 45 degrees.

All insulators to be operated at 23,000 volts or more should be tested with at least one kilowatt of available generator capacity for each insulator under test.

In conclusion, it is urged that the policy be a liberal one when it comes to the expenditures of the transmission line. As a general thing, no expense or trouble is spared in making the power-plant equipment complete, and in fully safeguarding this equipment. On the other hand, the transmission line, which in the event of failure for any cause makes the power-house entirely useless until the line trouble is corrected, is often provided for last, the expense being cut down to the lowest possible figure. Such a system is bound to have line troubles, causing heavy expense for repairs and losses due to interrupted service. These losses could be almost entirely prevented by the use of better insulators and proper line protection at the outset, and the cost of this insurance would be less in amount than the total for losses due to interruptions during a few months of operation.

TICKETS AS A FARE MEDIUM FOR STREET AND INTERURBAN RAILWAY TRAFFIC.*

BY JOHN F. OHMER, PRESIDENT OHMER FARE REGISTER COMPANY, DAYTON, O.

There is probably no commodity so popular and so well and universally known as the card or scrap of paper commonly called a railway ticket. It is used by millions of people in every civilized country in the world. It is made in a plurality of forms and printed on paper of all colors. It is used more extensively in England and on the continent of Europe, perhaps, than in our own country.

In 1906 the Grosse Berliner Strassenbahn of Berlin, Germany, disposed of 480,000,000 tickets, and one of the omnibus companies of London disposed of 500,000,000 tickets in the same year. The ticket is applied in dozens of ways; it has as many designations and differentiated values. For city properties we have 5-cent tickets, 6 tickets for 25 cents, 11 for 50 cents and 25 for $1.00; school tickets, employes' tickets, workmen's tickets, trip and time passes and all kinds of transfers, the latest innovation being Mayor Tom's aluminum slug, sold for three cents each by the Municipal Traction Company of Cleveland, O.

Tickets as a Fare Medium—Aluminum Ticket Used in Cleveland.

For interurban properties many city forms are used, besides a multiple of tickets, good to and from all stations, comprising the round-trip tickets, excursion tickets, special tickets, half-fare tickets, coupon tickets, mileage and commutation and a variety of forms of duplexes, some forms of all of which are adopted by companies for the convenience and accommodation of the public and to subserve the companies' interests. Is it to be wondered that the heads of certain auditors and passenger agents are fast turning gray?

A man lays down 50 cents and receives for his money a transportation ticket; the presumption is that he paid the company 50 cents for the ticket. As a matter of fact he paid for his ride and the company accepts the money and gives its promise to transport the bearer in one of its cars to the agreed destination, as evidenced by the ticket. In other words, the company issues its note to bearer. By that transaction the company becomes a debtor and the public a creditor to the extent of the money paid, and the company must deliver the goods or redeem its obligation by refunding the money it receives. It makes no difference whether the deposit be for a 3-cent ride or a dollar ride; whether it be for a ticket sold by station agents or by a conductor or whether it be for one part of a duplex ticket or for a transfer. The obligation of the company must be paid and it can have no assurance of the liquidation of its indebtedness until the promissory note is canceled. The company may, in reality, pay its obligation to the original creditor, but does it by so doing always cancel its liability, its note, its promise to pay? That is the vital question, and it is to that important feature, primarily, that I desire to direct your attention.

While it is true that by the issuing of a ticket the company receives its money in advance for the ride, it is likewise true that the credit issued is, in most cases, transferable and negotiable and thereby subject to use by a plurality of people and, under most conditions, a plurality of times. The loss and damage to the railway company, because of its great number of credits for miscellaneous amounts distributed through so many agencies and to thousand of creditors, can scarcely be computed. That the amount is enormous there can be no doubt. Neither can it be doubted that the extent of loss varies with the extent of operation and the various weak channels and avenues opened to encourage manipulation.

Transfers.

Beginning possibly with the lowest denomination of credits issued by railway companies, I will take up first the ordinary transfer used on practically all city properties. Although the usual form of transfer is issued with a limitation and the opportunities presented are less in number and are restricted as compared to those offered by the unlimited ticket, all managers know of the common practice of manipulating the transfers, both by the traveling public and by the conductors. It is carried on to such an extent that it is costing many companies millions of dollars. It is also well known that conductors substitute 2½-cent or 4-cent tickets for 5-cent cash fares. Too often the busy manager does not consider the question sufficiently to realize that 100 substitutions of 2½-cent tickets for 5-cent cash fares mean a loss of $2.50, and, when told that his conductors are making no separate record of the $2.50 collections and the $5.00 collections, but are recording both together as a collection, with the option of accounting for either class to suit their convenience, a searchlight seems to be turned upon the subject, revealing actual conditions which astound the manager.

The conductor on an interurban line takes in exchange for a ride the ticket fare medium, but does the acceptance of that ticket cancel the obligation of the company? The conductor issues one part of the duplex ticket to a passenger from whom he receives a cash fare; the passenger accepts the ticket as evidence of payment; in other words, a receipt for money paid. But, with the issuing of that ticket, does not the company issue its credit for the ride, limited perhaps to one day? Nevertheless the credit is made unconsciously possibly by most managements from the presumption that the issuing of a duplex ticket is merely a receipt to the passenger for his money.

Duplex Tickets.

Another passenger procures the company's credit in the form of a 50-cent ticket for a ride to destination. In exchange for the ride the passenger pays to the company's conductor the credit or promise of a ride issued to him by the company, but does the acceptance of that ticket by the conductor cancel the company's obligation? Although the conductor is instructed to punch the ticket upon receipt for the purpose of cancellation, does it necessarily follow that he will punch it or that the ticket is canceled even after being punched? So long as the ticket is not canceled is he not aware of the company's obligation extended by that ticket, and appreciating its value, is he not aware that advantage can be taken of the company by transferring it and retransferring the same obligation, which is good until properly canceled or redeemed? Is he not also aware that the company's obligation, made when he issued a cash duplex receipt for a cash fare paid, goes with the receipt issued and that, until canceled by limitation, it has intrinsic value subject to resale? And, encouraged by the large number of patrons who would rather see the company victimized than otherwise, is he not subject to and does he not very often yield to temptations offered for the furtherance of his own interests? He finds it profitable to shave the company's credits.

All these are questions too well known to require further comment, but the remedy for this defective operation is the all-absorbing topic, and we all are looking for any prescription to guarantee a better operation or at least to curb the chances of manipulation, if not entirely to effect a cure.

The practice of using discarded duplex tickets the second and often the third time is as well known as the practice of canceling different values on the same sequel, the company thereby sustaining the loss for the difference. If the use of the duplex ticket is for the purpose of auditing the receipts paid the conductor, then why the necessity through that medium of permitting the conductor to extend the company's credit and thereby continuing its liability? If a man gives a receipt for cash paid to him for services rendered he would be foolish to give a receipt that would in the least possible manner render him liable to perform the services the second time. Much less likely then would he authorize his agents to bind him for further performance other than that for which receipt is given.

Steam railroads take the precaution in all large cities to compel passengers to present tickets to gatekeepers for cancellation before passing out to the train, but the punching of a ticket by the gatekeeper does not cancel that ticket; if it did it could not be used by the passenger, and if it can be used by the passenger today it can likewise be used by another passenger tomorrow. It is possible, however, that the passenger on the second trip would circumvent the gatekeeper and board the train without passing through the gate or it may be possible for him to procure a low-rate ticket for presentation to the gatekeeper to insure his access to the train. While the gatekeeper's mission, if properly carried out, is a great safeguard, at the same time it does not insure to the company by any means that the same ticket cannot be used the second time or oftener, the extent of the manipulation being limited to the desires of an unscrupulous conductor and his correspondents.

In my estimation the fault is generally with the ticket. Whatever advantage is to be derived by the employment of the gatekeeper is limited to the large and terminal stations only and the application of this system would be confined to

*Paper read before the Central Electric Railway Association at Toledo, O., May 26, 1908.

very few interurban properties. It therefore behooves managements of interurban properties to provide themselves with the best opportunities offered for surrounding the sale and use of tickets with the greatest possible protection. For this important part of the operation the most efficient protection is none too good.

The tickets used on interurban roads particularly should be printed with the shortest limitation and it will be found profitable to have them devised to be self-canceling by the first use of the ticket. Inasmuch as the ticket itself carries with it the company's credit to the extent of its value, it is analogous to the use of a government certificate for $1.00, which, on its face, reads as follows: "This certifies that there has been deposited in the treasury of the United States of America one silver dollar, payable to bearer on demand." The certificate itself has only a circulating value, while its real worth is in the redemption feature; but so long as it is in circulation it has the value of a dollar's worth of silver back of it, which amount is made payable to bearer on demand. Likewise with a railroad ticket it constitutes a certificate for the amount deposited, and on its face it subscribes to perform its service to the holder thereof and is worth the amount deposited in exchange for its issue. I, therefore, contend that credits in the nature of transportation tickets, issued by railroad companies, are as valuable as the amount of money deposited against the issue of each, save and except the discount required for its negotiation. It is, therefore, of the utmost importance that upon receipt of tickets paid to him in exchange for rides, the conductor should charge himself and thereby credit the company for the cancellation of its obligation made by the issue of the ticket. The mere fact of a conductor charging himself with the receipt of a ticket irrespective of its value does not in any sense cancel the company's obligation made at the time the ticket was issued. It may, however, if the conductor charges himself by registering for a ticket, have the effect of discharging the company's obligation for the value of some form of ticket; but while the conductor receives a ticket which carries an obligation on the part of the company to the value of a dollar, he may, with the substitution of a 5-cent or 10-cent value ticket, release his responsibility to the charge of a ticket and still retain for subsequent use the company's larger obligation, and this process makes it easy, by the continued liability, for the company to unjustly pay its obligation the second or third time or oftener. The opportunities presented are so many and varied by the use and common practice of railway tickets that the unscrupulous conductor has his choice in many ways for manipulation without much fear of being detected.

As the rapid development of interurban properties and the expediency of making traffic arrangements for through traffic over several lines necessitates the sale of through tickets by all companies in the traffic compact, each company, by permitting the sale of tickets and by retailing its credits through the medium of tickets, further jeopardizes its interests by authorizing the agents of other companies to increase its obligations.

Standardization of Tickets.

One of the most important subjects which has been discussed and is now under discussion is the standardization of operation. It appears to me that to standardize the form of tickets as much as practicable and to prescribe a standardization for their use is opportune; and, while uniform or standard tickets would be desirable themselves, it must necessarily be more desirable if some standard application should be adopted for the use and auditing of all tickets, surrounded with the best possible safeguards, whereby all companies in the traffic arrangement would be placed on an equal basis, thereby insuring equity to all parties in interest.

Transfers.

The transfer has come to stay and while the best authorities agree that its use stimulates traffic, at the same time it is admitted that, by reason of abuse, it is causing much trouble and anxiety on the part of the managements. The loss for which it is responsible is something appalling. From a careful canvass among some of the larger city officials I am informed that there are issued from 25 to 30 per cent more transfers than the number collected. This great difference is caused primarily by the fact that conductors are usually informed that the transfer has no value, and with that understanding they issue it indiscriminately, either singly or in bunches, it being a matter of indifference usually whether any or all of the transfers issued are ever taken up by the company. No greater error was ever advocated than the managers' edict which proclaims that the transfer has no value, and it is because of this error that the losses, in a great measure, are sustained. Transfers, being numbered consecutively, enable the conductor to report as to the number he issues, and whether he issues them singly or in bunches is immaterial so far as making up his record is concerned. If an inaccessible record could be made of each transfer issued, by registering the issue of the transfer, it would, in my opinion, reduce very largely the excess transfers issued and reduce the chances of manipulation accordingly.

City Tickets.

A ticket issued by the company for $2\frac{1}{2}$ cents means a credit of $2\frac{1}{2}$ cents, and 100 $2\frac{1}{2}$-cent tickets means a credit of $2.50. The enormous number of $2\frac{1}{2}$-cent tickets and $4\frac{1}{6}$-cent tickets issued by many of our city properties means thousands of multiples of $2\frac{1}{2}$ cents and $2.50, $4\frac{1}{6}$ cents and $4.16\frac{2}{3}$, so that in the aggregate the extension of credit through the medium of tickets is something enormous. Unless the collection of each ticket is properly audited, to a certain extent the credit is merely extended to the conductor with an opportunity to shave the company to suit his inclination; likewise with the transfer, which carries with it a limited credit, and unless it, too, is properly recorded it may subserve its purpose to the conductor for manipulation.

The remedy, then, is to devise ways and means for the conductor to record each collection by itself, and specifically under its own value; until this is done there can be no hope of obtaining the best results.

If a workman is receiving for his services 22 cents per hour for certain hours of the day and 33 cents for certain other hours of the day, he would not, under any circumstances, permit his employer simply to add up the number of hours of service rendered and make settlement for so much per hour at the option of his employer. He would demand that a separate record be kept of each class of time and settlement made accordingly.

Your employes are paid on a graded scale; some are paid 22 cents per hour, some are paid 25 cents and others are paid 27 cents per hour. Suppose the total number of hours for all employes numbered 10,000 hours and your paymaster was instructed to use his own discretion in designating the number of hours and the pay for each; would the employe be satisfied or accept any such auditing of his credits?

Fares in Cleveland.

The first practical operation by municipal ownership in this country is probably that of the Municipal Traction Company of Cleveland, O. This company, immediately after taking over the property from the Cleveland Electric Railway Company, elected to charge a straight 3-cent fare and simultaneously issued a perforated aluminum disc about the size of a nickel. These discs are sold for the regulation price of three cents and I am informed that 3,000,000 of these discs are to be provided and issued to the public in the city of Cleveland. These discs have no limits as to time. If the statement that 3,000,000 of them are to be issued is true, after they are put in circulation the company will then have issued its credit for $90,000. It is reported that these discs are to be in common circulation as a medium of exchange for bread or beer. While the issue of these discs or coupons of a similar nature may make it more convenient for the payment of fares on Cleveland cars, I doubt the expediency of the adoption of the innovation for no other reason than the fact that the discs can be so easily counterfeited and with such a degree of perfection that it would be impossible to detect the counterfeited discs from the company's authorized issue. The company ultimately may find it expensive to redeem its credits, authorized and unauthorized.

Collections.

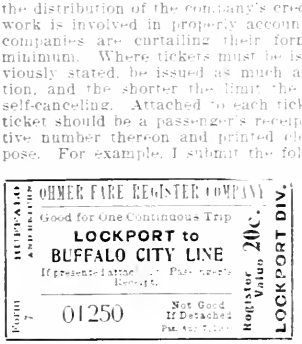
The ordinary practice which has prevailed for years provides to the conductor limited means whereby he is obliged to combine with his registrations different denominations of fares. His 5-cent fares, his 3-cent fares, his tickets of various values and sometimes his transfers are registered together. Does that operation charge him with the collections according to the value of each or does it charge him with just so many collections irrespective of the value; does that operation audit his debits to the company, and does it audit his work in advance for the auditing department? Acting as agent for the company the conductor should, on receipt of his company's credits, charge himself for each particular credit received. Operating under the system of registering different values together, is the conductor wholly to blame if in making returns he gives a collection of some kind for each collection with which he has charged himself? Has he been given competent means under such circumstances for making the proper charges and audits which will conform to the collections made by him? And has he been given the means whereby he can best subserve the company's interests and at the same time protect his own integrity? Many successful managers have long since realized the fallacy of the old-time operation and are now appreciating the subject after giving it a careful diag-

nosis. Only recently the general manager of one of the largest properties in New England, at a meeting of his district managers and superintendents, made the statement that "with the ordinary operation the companies themselves are fast manufacturing thieves."

On the other hand and in equity, no honorably disposed conductor will object to charging himself properly, by making a separate record for each value collected by him for the company, and if he has any knowledge of business and appreciation of justice he will prefer doing it for his own protection.

Interurban Tickets.

Obviously the greater the number of tickets the greater the distribution of the company's credits and the more clerical work is involved in properly accounting for them. The best companies are curtailing their forms and numbers to the minimum. Where tickets must be issued they should, as previously stated, be issued as much as possible with a limitation, and the shorter the limit the better. They should be self-canceling. Attached to each ticket and each coupon of a ticket should be a passenger's receipt with the same consecutive number thereon and printed clearly to indicate its purpose. For example, I submit the following:



Tickets as a Fare Medium—Interurban Ticket with Passenger's Receipt.

The consecutive number on the ticket and on the passenger's receipt is the same. Upon presentation of this ticket the conductor must detach the receipt and return the same to passenger to insure his ride to destination and the conductor must register the ticket as 20 cents. With that operation the collected ticket would not only be canceled, but the conductor would charge himself for the value of the ticket, viz., 20 cents, and he immediately establishes an audit for the cashier and auditing department for that collection. The same application can be made for all 1-way and round-trip tickets.

Public indication for each fare paid is a great guarantee and subserves its purpose to the company in a way that no secret or private record could possibly subserve. Besides, the direct registration or indication does not make a draft on the company's credits as with the issuing of a duplex.

Prof. Charles William Eliot, president of Harvard University, in a recent public address, referred to the acts of public officials as follows:

"Publicity is the cure for many evils. Entire publicity is the greatest guarantee of official honesty. The smallest acts of the public official should be open to examination by every citizen."

I can conceive of no more pertinent application of this injunction than to the thousands of conductors acting in the capacity of official agents for railroad companies in the collection of the company's cash and credits.

I have referred to the enormous collections of tickets made by the Grosse Berliner Strassenbahn of Berlin, and to one of the several omnibus companies in London. In this connection it might be pertinent to observe that in Great Britain and on the continent of Europe, in the Latin American countries and largely in the Oriental countries the general system of issuing tickets for fares paid prevails on all city properties, even for fares collected in small amounts. For instance, the T. Tilling, Limited, Omnibus Company collects fares and issues a ticket receipt for each fare collected in denominations as follows: ½d, 1d, 1½d, 2d, 2½d, 3d. In many cases the system prevails because of the city or country regulation which compels the giving of a receipt for each fare paid. The prevailing use of this system, with the opportunities for manipulation, the enormous cost of tickets and the great amount of clerical work involved in accounting for them are causing the management much anxiety, and a better system for operation has for a long time been sought by the managers of the great properties in the old world. The introduction into Europe of the multiple Ohmergraph promises to completely revolutionize the prevailing system of operation. I have, for some time, co-operated with the managements of a number of the largest companies in Great Britain and on the continent of Europe and recently [illegible] form of tickets and receipts [illegible] tem of operation for interurban [illegible]

In Germany the fares [illegible] France and Belgium from [illegible] Great Britain from ½d to 1 shilling.

I have in my office now the fare [illegible] of tickets and copies of vouchers [illegible] modus operandi of what is probably the [illegible] way corporation in the world—that of the United Underground Electric Railways. This [illegible] the Baker Street Waterloo Railway, Great Northern, Piccadilly & Brompton Railway and the Charing Cross, Euston & Hampstead Railway. Its actual paid up capital [illegible] The fares collected range from one penny to [illegible] a shilling and the number of revenue passengers [illegible] the millions daily. Just what success I may have in solving the perplexing problem of the fare collection service of the London Underground remains to be seen, but I suffice it to say that I feel highly honored in having referred to me the working out of a solution for the greatest electric properties in the world.

I believe in placing confidence in mankind—in fully crediting integrity until it is found guilty. Eliminate suspicion by removing the causes which produce it. Accord to every employe the means to do his work right and in a businesslike way, equally fair to him as it is to the employer, and the causes for suspicion will, in a great measure, be removed. We must continue struggling after the remote ideal of perfection, even though we never expect to obtain it. We would be unhappy if we did obtain it for the greatest joy in all things is the working for it. Let us continue to strive onward, always mindful of the injunction, "Fatherhood of God and brotherhood of man," and success will be ours.

THE MERIT SYSTEM OF DISCIPLINE.*

BY FRANK HARDY, DIVISION SUPERINTENDENT FT. WAYNE & WABASH VALLEY TRACTION COMPANY, HUNTINGTON, IND.

The merit system consists of a debit and credit account with each employe, kept in a book ruled for that purpose or in alphabetical files. An employe's violation of rules is charged against him by a certain number of demerit marks, the number depending upon the seriousness of the offense. As an offset against these demerit marks, he is entitled to receive a certain number of merit marks for acts performed which would be considered worthy of recognition by the company, or for a clear record for one month, and at the end of six months a cash prize is given to the motorman and conductor having the best record. Employes are allowed to examine their record at any time. When an employe's demerits exceed his merits by 100, he is discharged.

The objects of the merit system are, first, to avoid a loss of wages by persons employed and suffering to those dependent on their earnings; second, to stimulate and encourage employes in the faithful and intelligent performance of their duties.

The Ft. Wayne & Wabash Valley Traction Company has a list of violations of rules and the number of demerits imposed; also a list of meritorious acts with number of merits given for each.† This list is posted on all bulletin boards. Employes are notified when they receive merit or demerit marks on a blank form used for this purpose, giving date, time, number of charge, number of merits or demerits given, and, if necessary, a letter is written calling attention to the offense and the course the employe should have followed. When an employe receives merit and demerit marks a form is posted on all bulletin boards, which shows that an employe has received so many marks for a certain offense.

We have a merit board or court of inquiry, which meets once a week, composed of the general manager, superintendent of transportation and all local superintendents. The work of the board is to investigate, produce evidence and pass judgment on all violations of rules or meritorious acts. The minutes of the meetings of the board are kept as a part of the records of the merit system.

Our reason for having a code list of violations and meritorious acts is that when a notice is posted on bulletin boards that an employe has received marks for a violation no one but the man disciplined knows who is guilty. The employe who received marks will not be humiliated before the other employes, but each man will know that some employe has received marks and the reason therefor. This will not only

*Abstract of paper read before the Central Electric Railway Association at Toledo, O., May 20, 1908.

†See Electric Railway Review, February 15, 1908, page 217.

discipline the employe who received marks, but benefit all employes by warning them of the offense and causing them to guard against a repetition of it. If the company makes a new rule for the guidance of employes, attention can be called to the fact very quickly by showing and imposing demerit marks on its violation. If the list of merits and demerits is always before an employe it will aid him in his work by showing him right from wrong and will provide an incentive to do right.

The merit board meets on each Monday to act on all cases of the preceding week.

The advantage of the merit board is very evident. Many times a high official insists on hiring employes, being afraid to risk the judgment of the lower officials in hiring men. He will place this employe under a petty official, perhaps tyrannical, or partial, at least. If the lower official makes a grave mistake in discipline and the higher official corrects his mistake, the lower official loses prestige with the employe and discipline has been destroyed instead of created. How often the general manager believes that the motorman, conductor or other employe is right yet cannot take their side of the case openly, for if he does the superintendent completely loses control of the men and all cases of discipline would then be appealed to the general manager over the head of the superintendent. With the merit board this is overcome, as all employes are permitted to show, in writing, why they should not receive marks or ask the merit board to reconsider if they are not satisfied with the ruling.

Another advantage of the merit board is that the men on all divisions receive identically the same treatment. Many times a superintendent brings to notice violations on other divisions or on his own division which the men on other divisions are overlooking. In this way the service on each division receives the benefit of the experience, knowledge and the attention of the superintendents of all divisions, which it would not receive if they did not have a common cause in the merit board.

Some other advantages of the merit system are that it is fair and just both to employes and company; points out the right from wrong; is an incentive to do right; picks out the good men from the bad, and if handled carefully will defeat the idea of unionism, for unionism comes from the agitation of wrongs, real and imaginary. If men believe that they are receiving just treatment, that their record is what they make it and that their services are appreciated it is hard to produce ill-feeling or friction between employer and employe. The system teaches trainmen to be courteous, accommodating and careful and creates a better feeling between officers and employes. Under the old system if a man is to be disciplined, he is generally excused for a certain length of time. This means so many dollars to this man and his family. It is true that this will touch his feelings, but in nine cases out of ten he is farther away from the management and his feelings for the company is an ill-feeling. If this same man does a meritorious act and saves the company hundreds of dollars, the company cannot reward him by giving him a hundred dollars. All they can do is to thank him. In other words, under the old methods of discipline the employe gives dollars for thanks, which is not a fair exchange. Under the merit system the employe gets merits for thanks and demerits for discipline, which is a fair exchange.

The problem of discipline is an old one, probably because of this is due the fact that it is often considered lightly. Very few operating officers can say that they are absolutely satisfied with their method of discipline. Under the old method men were handled with varied success owing to the fact that some superintendents gave discipline much thought and careful attention as to details while others paid little attention to the subject. The same is true of the merit system. If it is put in use and then expected to run itself without a thought or without careful supervision and attention it will fail. Most cases of failure can be traced to the fact that it has not had proper attention, and that discipline has been administered by an individual instead of a merit board.

This system was first tried on the Interurban Division of the Ft. Wayne & Wabash Valley, being put into effect on May 1, 1907. It proved such a success that it was adopted for all of the city systems on January 15, 1908, after which date all train and car men on all divisions were subject to this system of control.

The Superintendents' Association was formed on December 30, 1907, and when the merit and demerit system was adopted last January, it was decided to have the Superintendents' Association form the merit board for passing on all cases subject to merits and demerits.

It is announced that the extension of the Toledo Fostoria & Findlay Railway from Pemberville to Toledo, O., will be opened for operation on June 1, completing a through line from Findlay.

THE CAPACITY OF THE NEW YORK SUBWAY.

Bion J. Arnold, consulting engineer, Chicago, has submitted to the New York public service commission for the first district a report on "The Capacity of the New York Subway," which is the fourth in a series of reports made by Mr. Arnold on the subway of the Interborough Rapid Transit Company, as the result of a comprehensive investigation designed to point out methods of improving the present service and to recommend changes to be made in future subways. The preceding reports have been published in the issues of the Electric Railway Review of December 7, 1907, page 892, February 29, 1908, page 262, and March 21, 1908, page 355.

The present report analyzes the fundamental design of the subway, points out how further increase in its capacity can be obtained and directs attention to certain fundamental defects or omissions in the present subway which should be avoided in future subways. In discussing the limitations of the subway Mr. Arnold says:

A study of the present subway will reveal the fact that one of its fundamental defects, as far as its capacity is concerned, is that it fails to carry sufficient passengers upon a fixed 5-cent fare to justify the large investment which was finally found necessary to produce this splendid means of transportation. The total investment required to build and equip the subway as it exists today amounts to approximately $75,000,000, of which $50,000,000 may be charged to the cost of the permanent way and $25,000,000 to the cost of equipment. Should it be contended that these figures include an excessive construction profit it is but fair to state that it is quite probable, in fact almost certain, that were the subway to be constructed now the open cut method of construction would not be allowed and thus the actual cost of reproducing the present subway would be increased by a greater amount than is represented by any amount which may be included in the above figures as a construction profit.

In 1907 the subway carried 182,000,000 passengers and during the present year it may possibly carry 200,000,000 passengers, resulting in an annual income of $10,000,000. Thus the gross income per annum from passenger traffic will be equal to only about 13 per cent on the actual investment, as compared with surface and elevated railway systems, many of which take in an amount equivalent to 20 to 25 per cent of the costs necessary to reproduce them.

For the last two years the operating expenses of the subway have amounted to an average of approximately 45 per cent of the gross receipts. On this basis the annual operating expenses, with a gross income of $10,000,000, will amount to $4,500,000, leaving $5,500,000 to be applied toward the payment of interest, depreciation, taxes, sinking fund and profit. This amount is only 7.33 per cent upon the above investment of $75,000,000, and it is thus apparent that the present subway, which is now overloaded, is not built in such a way as to furnish sufficient capacity; with the conditions under which it has to operate, to produce financial results consistent with the investment.

Recommendations.

The improvements suggested in the report may be summarized as follows:

(1) The changes required in the present subway to increase its capacity from 30 trains an hour to 40 trains an hour, with a marked increase in its earning capacity, should be carried out; that is, the block signal system should be improved, a speed control system developed and the cars altered, all in accordance with recommendations made in Reports Nos. 1, 2 and 3.

(2) The Ninety-sixth street alterations should include not only the removal of the crossovers as already approved by the commission but also the altering of the station itself to provide a local track upon a lower level, allowing the four tracks upon the present level to be used by the express trains.

(3) A shuttle train service for the South Ferry station should be provided at once and a comprehensive study should be made of a plan for a double-decked station at this point which would not only give all South Ferry passengers a station on the main line, thus eliminating the shuttle train service, but also allow all trains to run through to Brooklyn.

(4) The braking of the trains at the stations should be improved so as to save the five seconds which is now often lost by lack of skill in stopping the trains.

(5) One car should be added to the rear of each local train during rush hours and the public should be encouraged to use this extra car upon the local trains, which, although not reaching the platforms, could be used for through travel

with the idea of adding even more cars to the trains if the public can be educated to take advantage of this increased accommodation.

(6) A series of braking tests showing the distance required to stop a train by means of the emergency stop from full speed should be made in order to secure reliable data for planning the block signal systems for future subways.

(7) The manufacturers of block signal systems should be encouraged to develop a traveling caution signal to supplement the present fixed caution signal, as this signal could be installed to advantage not only in the present subway but in future subways.

(8) If future subways are to be built and operated independently of the present one the plans should be made with the idea of using multiple side door cars 18 inches wider than the present car, thus adding at once 25 per cent to the capacity of each car and increasing the possible carrying capacity of such subways without proportionately increasing their first cost.

(9) In order that future subways shall not only pay a fair return on their investment but also allow for a satisfactory depreciation reserve, it is essential that such subways be located where there is sufficient density of traffic to justify their being built and at the same time they should be so designed as to handle the volume of traffic which must be passed through them during rush-hour periods in order to make them self-sustaining.

(10) All future trunk line subways should be designed with stations on the reservoir principle, that is, with double tracks in each station for each main line track. This can best be accomplished by not only double-decking the stations, but also double-decking the subways between stations and by this method secure the carrying capacity necessary to justify the occupancy of the street and at the same time produce a property which will justify its cost. Where a crosstown subway is to be provided for the stations should be triple-decked.

ENGINEERING FEATURES OF THE WASHINGTON STREET TUNNEL, BOSTON.

In the early part of the year 1909 it is expected that a new rapid transit double-track tunnel will be in operation under Washington street, Boston, the most important business thoroughfare in New England. The changes in the transportation facilities of the city which the operation of this new tunnel will inaugurate have already been outlined in the Electric Railway Review. The most striking feature will be the withdrawal of elevated trains from the original subway under Tremont street, their transfer to the Washington street tunnel and the replacement of the surface car service in the Tremont street subway which was withdrawn upon the opening of the Boston Elevated Railway Company's train service in June, 1901.

The Washington street tunnel is much more favorably designed with reference to the operation of train service than the original subway, and besides being far less encumbered with curves and grades, it will accommodate 8-car trains at its station platforms, against a maximum capacity per subway platform of five elevated cars per track. On account of the narrowness of the thoroughfare under which the Washington street tunnel is built, the construction problems encountered by the Boston transit commission in the prosecution of the work under the direction of Howard A. Carson, chief engineer, present special interest to the expert in the field of urban rapid transit.

The Washington street tunnel extends from a point in Ash street, south end, opposite Nassau street, to the incline for elevated trains in the north end, between Haymarket square and the North station. The total length is about 6,100 feet. The construction work required the division of the tunnel into 11 sections, and stations are located at Boylston and Essex streets, Winter and Summer streets, Milk street, State street and at Union-Friend street. Of the whole length of the tunnel about 50 per cent is straight, 33 per cent has a curvature of about 5,000 feet radius, 2 per cent 1,800 feet radius, and 15 per cent 500 feet radius. Of the whole length of the tunnel 40 per cent is level, 7 per cent has a grade of less than 1 per cent, 22 per cent about 2 per cent grade, 13 per cent between 3 and 4 per cent grade, and 18 per cent of 5 per cent grade. The latter is mainly at the inclined approaches, by which the elevated trains now in operation on the elevated structure in Boston will descend and ascend in connection with their movements in the tunnel. The lowest point in the tunnel is about 52 feet below the level of the elevated structure at the North station.

The tunnel structure in Washington street is in no place far removed from the abutting building lines. On account of the narrowness and irregularity of the street and the frequency of the station platforms, the cross section of the tunnel varies every few feet, and the design was a special problem throughout. Extensive removals of gas, water, sewer pipes, electric and pneumatic services were required. Most of the earth from the pavement to the tunnel bottom had to be taken out. The work was carried on with so little disturbance to traffic of any kind that many citizens of Boston are still unaware that a new tunnel has been built and is now being finished for service under the city's most congested street. The paved surface has been replaced little by little with heavy planking laid flush with the original surface of the paving, and supported on timbers, most of the daytime work being done under this bridging. Cars have not been diverted from the street during the day except in case of emergency, and at all times space has been left for the passage of the fire department.

The general method of doing the work has been underpinning of buildings where necessary, building side walls in narrow trenches one at a time, building new sewers, placing interior posts, in trench if any are required, putting on the roof, digging out the core and completing the invert. South of Kneeland street the tunnel is wholly under private land and the supporting of present and future buildings was met by a heavy roof of steel beams and concrete, carried by reinforced concrete side walls and steel posts in line between the tracks. North of Kneeland street the narrowness of the cut obliged the use of staggered station platforms as near the street as possible, and at these platforms the roof is built of steel girders with concrete arches between. Where there are no platforms, and where a considerable portion of the tunnel is deep, without platforms, the covering is an arch with tie rods. In all parts of the work the contingency has been provided for that the pressure of the earth may be removed on either side of the tunnel while a heavy load is being carried on top and a pressure is being exerted on the other side; a provision not usually necessary in other cities.

Work was begun October 6, 1904, on the southerly incline of the tunnel and at the present time part of the tunnel is being ballasted for tracklaying and the side walls and stations are being tiled and finished. Extensive changes in the platform and track arrangements north of the Union-Friend station are still to be completed, but the major portion of the tunnel is practically finished and ready for the Boston Elevated Railway Company, its lessor, to install tracks and electrical equipment. Plans for the latter are now being worked out by the company.

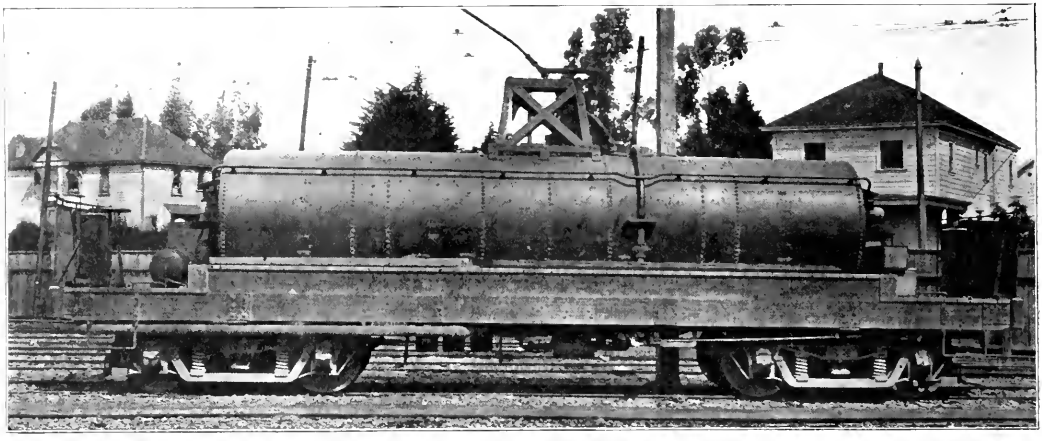
The Indiana Union Traction Company has begun extensive improvements at Mounds Park, near Anderson, Ind. Howard Witt of Anderson has been engaged as amusement manager. A contract has been let to the Ingersoll Amusement Company of Pittsburg to install a scenic railway. A large "figure eight" and other attractions will also be added. The park season will open on May 29 with a band concert.

The Union Loop Protective Association of Chicago recently exhibited at its offices a model of a proposed elevated station designed by Charles K. Mohler, which the association seeks to have the elevated roads adopt for the loop. The station is composed largely of prismatic glass for stairways, platforms and canopy roofs, in order to avoid the darkness in the streets occupied by the loop structure, which is frequently complained of by property owners.

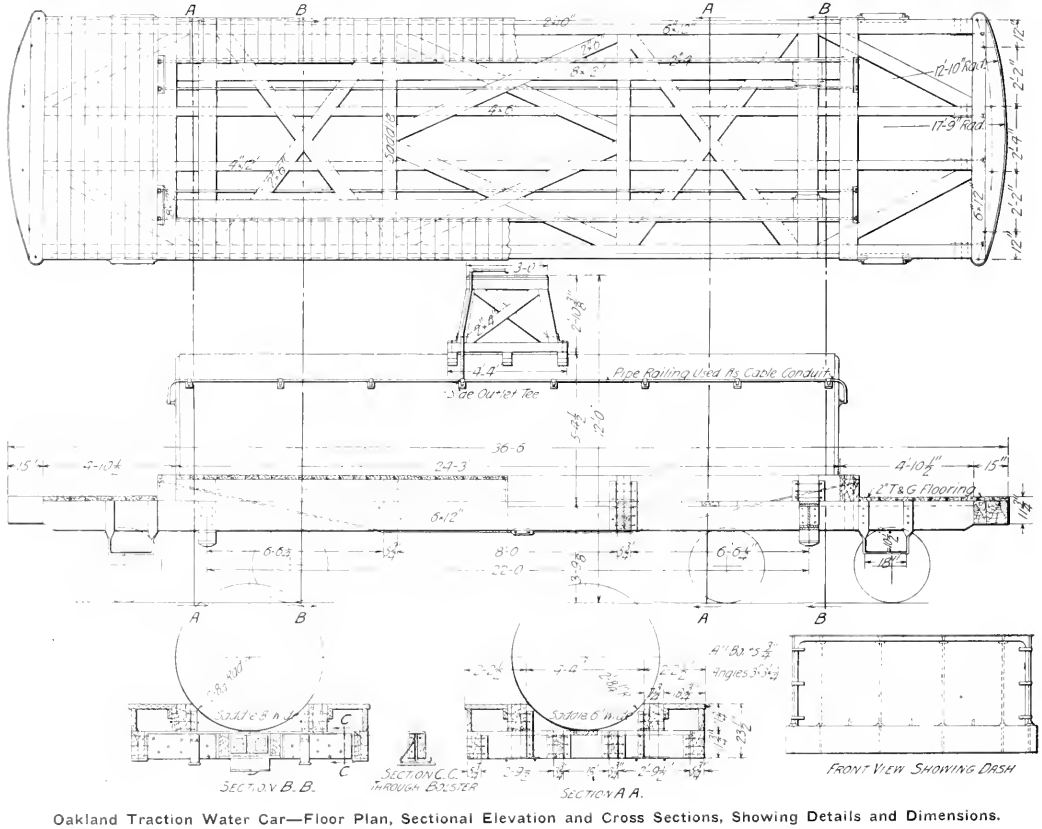
A 4,000-GALLON WATER CAR.

During the past year the Oakland Traction Company, Oakland, Cal., built at its shops the water tank car shown in the accompanying illustration. This car, which is 36 feet 6 inches over bumpers, comprises a wooden framework and saddle in which rests a 4,000-gallon capacity steel tank. One of the illustrations exhibits the detail dimensions of the tank framing and floor structure of the car.

The steel tank comprises a ¼-inch steel shell 5 feet 4½ inches in diameter and 24 feet long. This steel tank rests in continuous saddles so that the load is evenly distributed



Oakland Traction Water Car—View of Car in Yards.



Oakland Traction Water Car—Floor Plan, Sectional Elevation and Cross Sections, Showing Details and Dimensions.

over the sills. The interior of the tank is divided by three vertical bulkheads and a horizontal surge plate of steel ¼ inch thick.

It will be noted by reference to the halftone engraving that the car is electrically equipped, being provided with a trolley stand mounted on a framework tower supported by the tank. The cable from the trolley base passes into the pipe hand railing along the side of the tank, which serves as a cable conduit. Each end of the car is provided with a platform controller as well as air brake and hand brake control. The air reservoir is carried on one end of the platform. Four GE-1,000 35-horsepower motors are included in the electrical equipment.

TESTING AN OIL BURNING ENGINE.

The methods followed in a test recently made on a 500-horsepower Diesel engine illustrate the readiness with which the essential test data can be secured with an oil engine unit. In this test a belted generator had to be used as a load, and the resulting efficiency records were obtained on the kilowatt hour basis, including the losses in the mechanical transmission as well as in the generator.

The revolutions of the engine were taken with a counter, the speed variations being followed by a tachometer. The temperature of the exhaust gases, which varied from 695 degrees F. at 522 estimated brake horsepower to 372 degrees at 152 brake horsepower, was measured by mercury-nitrogen thermometers. The exhaust pipes were water-jacketed, but near the cylinders a rib of metal was left in each, uniting the inner pipe to the outer. These ribs were bored to take oil cups, and the thermometers introduced there. On the third cylinder of the engine an open tube was used, with a small stuffing box for the thermometer. Very little difference was found between the readings by these separate methods. The cooling water for the cylinder jackets, exhaust pipes and air compressors used in this type of engine was measured by a single meter, about half a pound being required per indicated horsepower per minute. The temperatures of this supply varied from 122 degrees at maximum load to 104 degrees at minimum output, with an initial temperature of 47, all readily measured with standard feed water thermometers. The conditions of the test did not permit of the separate measurement of the quantity of cooling water supplied to each jacket, so that the heat absorbed from the exhaust pipe gases could not be ascertained. This is a minor figure, however. Attempts were made to measure the discharge from the jacket waste pipes by small vessels placed on scales, but the results were not satisfactory.

In the test, the mean effective pressures were calculated from indicator diagrams taken at intervals of 15 minutes by indicators with external springs. The piston diameter of these was measured, and found to be practically correct. The springs were tested by dead weights, and the necessary corrections made in the mean pressures calculated from the diagrams.

The terminal efficiency of the engine figured from 42 to 47 per cent, and the consumption of crude oil of 18,000 British terminal units per pound per estimated brake horsepower hour was .449 pounds at 522 brake horsepower; .484 pounds at 249 brake horsepower, and .568 pounds at 152 brake horsepower. The friction losses were obtained by making electrical measurements of the power absorbed by the loaded generator, and deducting the power absorbed by the compressors used in forcing air into the engine cylinders at the compression stroke. The C^2R losses were obtained directly at one-quarter load, and estimated for the larger outputs. The iron and friction losses of the generator were obtained by running it as a motor without the belt, the field current being adjusted to give normal speed, the voltage at which the current was supplied being the full normal potential generated by the machine. These losses at full load were about 23 kilowatts. The engine and belt friction losses varied from 134 horsepower at quarter load to 149 horsepower at full output. This difference was probable due to a change in adjustment required by the failure of a belt during the tests.

The oil used was weighed and chemically analyzed. The calculated calorific power was 18,823 British terminal units per pound. The exhaust gases were analyzed by an Orsat apparatus, the samples being taken directly into the measuring tube by a pipe connected with the three exhaust pipes, in which a current was maintained by a water pump. At full load these gases showed 81.9 per cent nitrogen, 10.1 per cent oxygen, 0.1 per cent CO, and 7.6 per cent CO_2. At half load the oxygen increased and the CO_2 decreased about 50 per cent, there being no CO under full load.

Practically the only outside expert knowledge required in a test like this is in connection with the chemical analysis of the fuel, and the cost for a calorific determination on that basis, including the analysis, accurate to one per cent at least, should not exceed $15. Any company operating with an oil engine of one or two hundred horsepower up ought to own the necessary indicators and thermometers for regular observation of the machine's performance, as well as a flue gas analyzing apparatus. Only by close test and service analysis can the high economy of the internal combustion engine be kept at its best.

ANNUAL MEETING OKLAHOMA ASSOCIATION.

The second annual convention of the Oklahoma Electric Light, Railway and Gas Association was held at Guthrie, Okla., on May 25, 26 and 27, with a large number of delegates in attendance. The meeting was called to order by President F. H. Tidnam, after which the following programme was presented.

MONDAY.

"Necessity of Public Service Utilities," Gov. Charles N. Haskell.
Address of welcome, Mayor C. M. Barnes.
Response, R. N. Gascho.
President's annual address.
Minutes of the last convention.
"Light and Illumination," C. M. Jansky.

Street Railways.

"Construction in Oklahoma," Charles W. Ford, general superintendent Oklahoma Railway, Oklahoma City.
"Operating," O. W. Weddle, superintendent Shawnee-Tecumseh Traction Company, Shawnee.
Practical question box, conducted by R. P. Sauerhering.
Demonstration and explanation by exhibitors.

TUESDAY.

"Installation, Maintenance, Testing, Care of Meters," R. P. Sauernering.
"Economical Operation of Small Plants," R. N. Gascho.
"Feasibilty of Pay-As-You-Enter Cars," William Busby.

Gas.

"Light and Heat," R. O. Deming.
"Distribution," H. C. Nelson.

Power.

"Small Motors," F. W. Caldwell.
"Large Motors," Galen Crow.

Fuel.

"Coal," H. H. Stephens.
"Oil and Gas," Ed J. Reynolds.
Answers to question box.
Grand rejuvenation and smoker, Sons of Jove.

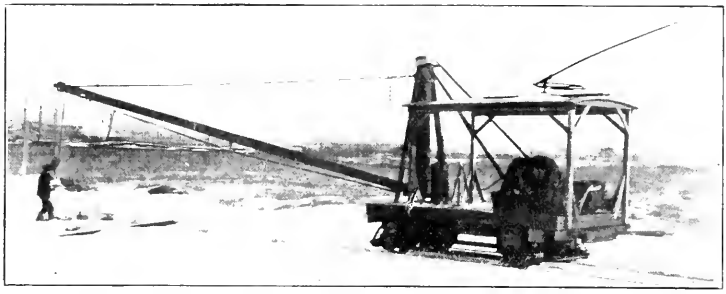
WEDNESDAY.

"Commercial Relations Between the Central Station and the Customer," Fred J. Bedford.
"Relation Between the Public Service Utilities and the Public," Hon. H. M. Scales.

The meeting concluded with a closed session for active members only and the election of officers. Afterward the members were given a trolley ride over the city of Guthrie and an air dome entertainment in the evening ended the convention.

SINGLE AND DOUBLE CRANE CARS AT BALTIMORE.

The two crane cars shown in the accompanying illustrations were built at the shops of the United Railways & Electric Company, Baltimore, and are put to various uses on that system. It will be noted that one of these cars is provided with two cranes of short reach; the other has a single boom of long reach.

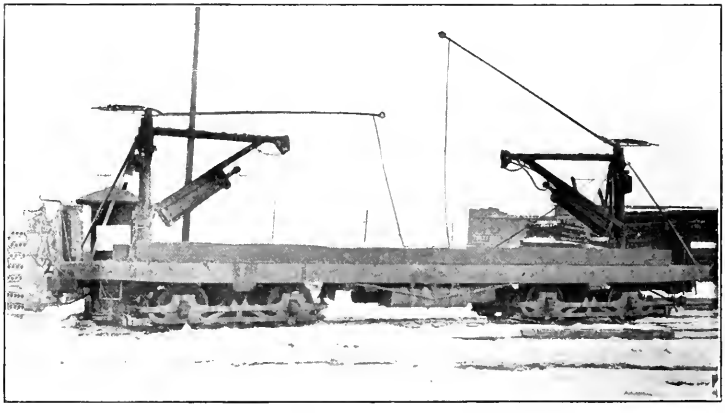


Baltimore Crane Cars—Boom 35 Feet Long, Lifting Capacity 2,000 Pounds.

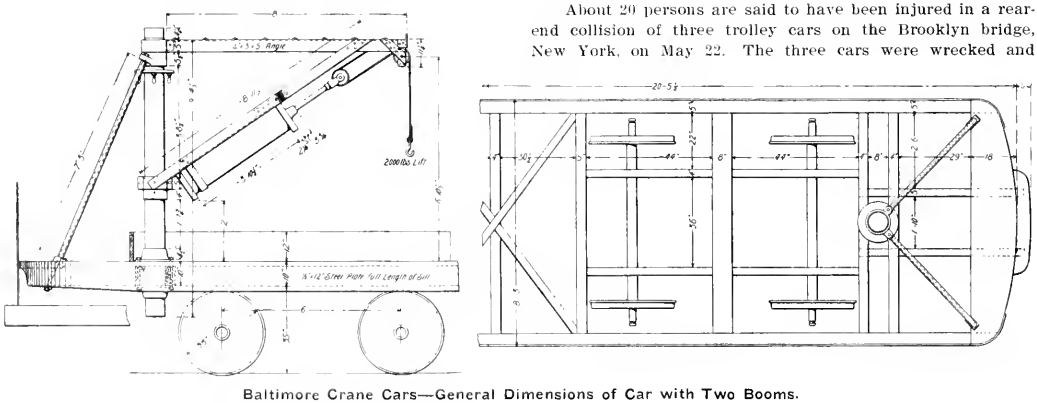
An illustration reproduced from a line drawing exhibits the general dimensions of the crane car which is provided with two booms. Each of these booms is eight feet long and carries on an inclined strut an air cylinder with a stroke of about three feet. On 85-pound pressure in the cylinder each crane has a lifting capacity of 2,000 pounds, for which loading the swinging booms were designed. The crane posts are made of 8-inch pipe and the braces are hydraulic tubing inclosing 1-inch rods, this combination being designed to take both compression and tension stresses, according to the working position of the boom.

The car body is 41 feet long over all and 8 feet 3 inches wide. With the two cranes, one on either end of this car, it is easily possible to handle rails and special track work. The car is built with low sides so that it also may be used for hauling track materials. The electrical equipment, designed for double-end operation, comprises four Westinghouse No. 49 motors and a 24-foot capacity air compressor with its governor set to maintain 85 pounds pressure on the tanks. Extra large tank capacity is carried so that there may be an ample supply of air for operating the cranes.

The smaller crane car has a boom 35 feet long and a mast with anchors designed so that a load of 2,000 pounds may be lifted at the end of this boom, when swung at right angles to the track. The mast is 10 feet high and is built directly on a steel frame carried on two axles spaced nine feet apart. To each axle is geared a Westinghouse No. 3 motor and on the platform of the car is a hoisting drum geared to a 12-A motor. This car is found very useful in handling 60-foot rails, as well as other forms of heavy construction material which it is desirable to handle.



Baltimore Crane Cars—Work Car with Two 2,000-Pound Cranes.



Baltimore Crane Cars—General Dimensions of Car with Two Booms.

About 20 persons are said to have been injured in a rear-end collision of three trolley cars on the Brooklyn bridge, New York, on May 22. The three cars were wrecked and traffic was delayed for about an hour. Slippery rails are said to have been the cause.

COMBINATION RAILWAY, TELEPHONE AND LIGHTING POLES.

Paul Spencer presented before the National Electric Light Association, at Chicago on May 19, specifications for line construction on poles jointly used. He said in part with regard to railway attachments as follows:

Where the railway construction is of a type in which the trolley wire is supported by spans attached to two separate lines of poles, and these two lines of poles are to be used for the attachments of the lighting, railway and telephone companies, it is always preferable that the lighting, power and railway lines should be carried on one line of poles, and that the telephone lines should be carried on the other line of poles.

Where the railway attachments and the telephone attachments are carried on one and the same line of poles, the railway feeders and attachments shall occupy a position on the pole below that occupied by the telephone crossarms. If the poles carry also lighting and power attachments, these shall occupy the upper position on the pole and above the telephone attachments.

Where span wires and brackets for supporting or holding trolley and guard wires are attached to poles jointly used, the attachment shall be made as follows:

The span wires and supporting brackets may be attached to the pole at a height convenient for the railway operation.

The span wires and brackets may be attached to the pole by bolts passing through the pole.

Every span wire and bracket supporting trolley wires shall be effectually insulated from the railway potential.

The railway feeders on poles jointly used shall be carried on crossarms located on the pole approximately at the point of attachment of the supporting trolley span or bracket.

Where telephone attachments are located above such feeders, a horizonatal distance of not less than 24 inches shall be maintained between the pole pins on the crossarms carrying the railway feeders.

On poles carrying railway attachments the lowest telephone crossarm shall be at least two feet above any part of the brackets or span wires supporting the trolley wire and shall also be above the nearest railway crossarm by a distance not less than 40 inches.

Signal boxes, switches, cutouts and similar railway apparatus may be installed on the pole at the point necessary for convenient operation, provided that they shall not be installed in such a manner as to interfere with the employes of either company in climbing the pole or to prevent the installation of vertical runs. When located below telephone lines or attachments, they shall be of a type in which all live parts are covered and protected from accidental contact.

Railway signal line wires, run on jointly used poles and below telephone attachments, shall be installed so as to provide a climbing space through them of not less than 24 inches.

Connecting wires to such railway apparatus, run down the pole, shall be insulated and shall be attached to the street side of the pole, and maintained at a distance of not less than five inches from the surface of the pole.

Whenever poles used by the railway company are too low to permit, under the terms of this specification, the attachment thereto by the telephone company of crossarms for carrying their wires, the telephone attachments which may be made shall consist only of twisted pairs, or a single telephone cable.

Where only one such twisted pair is used, it may be carried on an insulator on the top of the pole, or on a side bracket.

Where more than one twisted pair is carried along the line of poles, the pairs shall be bunched together throughout their length and attached at or near the top of the poles. In no case shall the pairs so carried exceed ten in number.

Where the telephone cable is attached to such poles it shall not exceed 1½ inches diameter, and shall be placed at or near the top of the pole.

The attachment of twisted pairs or of telephone cable, as above, shall be so made as not to restrict the proper use of the pole by the railway company, and the railway company may use its standard methods of construction in installing its feeders, span wires, brackets, switches and any other appliances on such poles.

Excepting where otherwise specified, every electric light and railway line wire and connecting wire shall be covered with at least a standard triple-braided weatherproofed insulation.

The Gary & Interurban Railway began operating on May 20 the first section of its street railway line in Gary, Ind., about 2½ miles long, extending from the Calumet river to the steel mills.

News of the Week

Transit Affairs in New York.

A. W. McLimont, electrical engineer of the public service commission, has submitted a report on the work done by the New York City Railway in overhauling its summer cars. Mr. McLimont says that the receivers of the company have been quick to respond to suggestions made by the commission's inspectors, that the work is progressing favorably and that the cars are being put into the best condition possible.

The commission issued an order on May 22 to the Interborough Rapid Transit Company to begin work on the contemplated rearrangement of the subway tracks between Ninety-sixth street and One Hundred and Third street, which is expected to relieve much of the congestion between these points by eliminating the necessity of crossing the express trains over the local tracks.

Governor Hughes has signed the Frawley bill, which gives the public service commission and the board of estimate authority to open negotiations for acquiring for the city the Belmont or Steinway tunnel under the East river at Forty-second street. In a memorandum the governor says that this is a power which the city should possess, but that whether it should be exercised depends on the terms that can be made.

The Robinson bill, making general amendments to the rapid transit law designed to facilitate subway building in New York by offering more attractive inducements to private capital, died on May 24 with the expiration of the 30-day period without receiving the governor's signature. The salient feature of the bill is the provison for the sale of the franchise to construct and operate subways, with a reservation to the city of the right to purchase at the expiration of a fixed period, not to exceed 50 years. The governor made public a 1,200-word statement, giving his reasons for vetoing the bill. He said that the plan proposed by the bill is illusory and injurious, because, although it did not necessarily prevent construction by the city, if the bill became a law its practical effect would be that no construction at public expense would be undertaken until every available means to secure construction by private capital had been exhausted.

The governor also vetoed the fare bill, which provided for a 5-cent fare to Coney Island unless the public service commission authorized a higher rate of fare. The governor's failure to approve the bill was due to his conviction that the public service commission has ample power to regulate the fare.

New York Traction Investigation Concluded.

The New York public service commission of the first district closed on May 21 the investigation of the affairs of the traction companies of the city, which was started on Juy 18 last, but which was interrupted in October. Since then William M. Ivins, the special counsel, has had a large staff of experts examining the books of the various railroad companies of the city and the result was read into the minutes. These reports comprise more than a thousand pages of typewritten matter and as Mr. Ivins explained to the commission they really make up a history of the various companies from the time of their inception until the present day. The data presented to the commission by Mr. Ivins went into every detail of the financial reorganizations of the different companies until they were merged into the Metropolitan system, which was in turn gathered into the Interborough system. In presenting the reports to the commission Mr. Ivins said:

"I believe that the objects for which the resolution of July 18 was passed have now been practically attained. Your chairman, as sitting commissioner, initiated an investigation of the operating condition, condition of rolling stock and other equipment and train service, of the entire transportation system of the city, and these matters have since been taken up and the work carried on by different members of the commission with practical results of great promise.

"The history of the Metropolitan Street Railway Company, the New York City Railway Company and the Metropolitan Securities Company has been investigated as exhaustively as the functions of the commission require, or permit, for the purposes for which it was created. Once the Metropolitan Street Railway system went into the hands of the receivers all financial investigation became of interest only as bearing upon questions of cost of construction, operation and maintenance and as looking to the future financial reorganization of the system. Thenceforward the commission could issue its orders only to the receivers, who in turn could only act in conformity with the general or particular instructions of the United States circuit court. * * *

"When, however, these matters shall all have been judi-

cially settled and the issue of new securities shall come up for authorization the commission will not only have before it all proceedings of the court and its agents but may then profitably conduct any new or further investigation to enable it to determine its own duties in the premises.

"The enforcement of the criminal law for wrongdoing in the past, once the facts in the case were disclosed by the commission, was outside of the scope of the commission, and the investigation into the matter of the criminal responsibility, if any, for past practices has been in the hands of the grand jury and the state courts since November last."

Cleveland Strike.

Efforts to settle the strike of the employes of the Municipal Traction Company of Cleveland by arbitration have thus far proved fruitless and the city is still hampered by a greatly disturbed street car service, although most of the violence has been stopped. On Thursday of last week representatives of the union and President A. B. du Pont of the Municipal Traction Company agreed to submit to arbitration the principal cause of the controversy, the agreement of the Cleveland Electric Railway to increase wages two cents an hour in the event of a renewal of its franchises, but could not agree on the status of the men in case of a settlement. Mr. du Pont insisted on the strikers returning to work as new men.

Arthur E. Stearns was appointed to represent the company and Elroy M. Avery to represent the strikers. These men were to appoint a third arbitrator. Several conferences were held on Friday and Saturday in the effort to agree on the terms of arbitration and the third man to be selected. G. K. Shurtleff was named on Friday, but was unable to serve.

Mr. du Pont steadfastly refused to restore the strikers to their positions pending arbitration and maintained that the men who had remained with the company as strikebreakers had superior rights. On Saturday it was agreed to submit the question of seniority to the men. On Saturday night and Sunday morning the strikers voted to return to work as new men, temporarily surrendering their seniority rights, which were to be decided upon by the board of arbitration before taking up the labor agreement. Mr. du Pont agreed to abide by this agreement, provided the Municipal Traction Company employes agreed, but on Monday they took a vote and refused to submit their seniority rights to arbitration. This action opened up the entire question except as to the labor agreement, and at latest reports negotiations were still in progress. Several cars were dynamited on Thursday and Friday and several people were injured by the violence of the strikers and their sympathizers, but since the negotiations have reached a favorable stage disturbances have been rare, although the service has been very irregular, especially in the suburbs. Twelve men were arrested on Monday, charged with having been implicated in the wrecking.

Representatives of the strikers have been circulating a petition, under the provisions of the new Schmidt law, asking that the security franchise to the Cleveland Electric Railway, under which the Municipal Traction Company is operating, be submitted to a referendum vote of the people. Petitions containing 24,000 names were submitted to the city council on Monday night, but no action was taken. An ordinance was introduced changing the fare provision of the ordinance from six tickets for a quarter to seven, but it was tabled.

Wage Increases in Pennsylvania.—The Beaver Valley Traction Company of Beaver Falls, Pa., has increased the wages of its conductors and motormen to 20, 21 and 22 cents an hour for the first, second, third and succeeding years, respectively. The Washington & Canonsburg Railway has also increased its wage scale to 19½, 20½ and 21½ cents an hour.

American Association Bulletins.—Bernard V. Swenson, secretary of the American Street and Interurban Railway Association, 29 West Thirty-ninth street, New York, is issuing to member companies a supplement to Bulletin No. 101, entitled "Confidential Information Concerning Wages of Conductors and Motormen," which contains some valuable figures regarding the cost of platform labor; also Bulletin No. 103, entitled "Confidential Information Concerning the Relation Between Operating Expenses and Gross Receipts on a Percentage Basis for Interurban Lines."

Accident in Philadelphia.—A serious accident occurred in Philadelphia on May 24, when two crowded cars of the Philadelphia Rapid Transit Company collided on a steep grade. Forty-five persons were injured sufficiently to be taken to hospitals, three were killed and five more are said to have been fatally injured. The accident was caused by a northbound car on the Germantown avenue line near Chestnut Hill leaving the track while going down a steep grade and swinging over to the southbound track, where it collided with a car ascending the hill.

Traffic and Transportation

Fare Contracts with Municipalities Upheld by Indiana Commission.

In decisions upon cases concerning the Indiana Union Traction Company and the Indianapolis Columbus & Southern Traction Company, the Indiana railroad commission holds that an ordinance granting the right to an interurban road to operate on city or town streets and fixing the fare for service in the municipal territory constitutes a contract when acted upon by the company, and that such a contract is entitled to the protection furnished by the United States constitution and cannot be impaired by subsequent legislative enactments.

In April last complaint was made to the commission that a passenger was charged 10 cents by the Indiana Union Traction Company for passage on its limited interurban car between Fortville and Ingalls, a distance of 2.84 miles. At the same time complaint was made by another passenger that he had been charged 10 cents for passage on the Indianapolis Columbus & Southern Traction Company between Station No. 68, Short's Road and Seymour, a distance of 2.5 miles.

The facts in the complaints were submitted to the carriers interested and their counsel filed briefs with the commission, which presented questions for consideration as follows:

"Does the act approved February 25, 1907, establishing a maximum passenger fare of 2 cents per mile, apply to interurban railroads? If the act does apply to interurban lines, may they not charge an excess fare for service on their limited cars, which are better equipped, more convenient and make better time, than their local cars? Ingalls, Fortville and Seymour are each incorporated, and the traction companies operate on their streets. When their respective franchises were granted the traction company in each instance was given permission to charge 5 cents for a single passenger fare within the corporate limits. These franchises were granted and accepted prior to the enactment of the maximum rate law above mentioned."

"It is claimed," the commission says in its opinion, "that in the first case the Indiana Union Traction Company could charge 5 cents for its service in Ingalls, 5 cents for its service in Fortville and 5 cents for its service between these towns and yet be within the provisions of the maximum rate law, and it is likewise contended that the Indianapolis Columbus & Southern Traction Company could charge 5 cents for its service in the city of Seymour and a like sum for its service between Seymour and stop No. 68."

The commission found as to the first two propositions that it was not necessary at this time to express its views in this investigation, and therefore left the question open for further consideration, if occasion should require. The commission's decision was on the third point.

"The rule declared by the supreme court of the United States," the commission says, "which is the final authority on this question, seems to be uniform and to cover the questions raised by the third proposition above stated, and to decide the same in favor of the contention of the interurban lines. By these decisions we are bound and cheerfully abide, not only because they state the law, but are, as applied to this inquiry, seemingly fair and just.

"The commission being of the opinion stated as to the law applicable to this inquiry it results in our holding as we do that there was no violation of the law in the cases under investigation."

The opinion was written by Commissioner C. V. McAdams.

Petition for Trolley and Freight Franchise in Massachusetts.—The Springfield & Eastern Street Railway of Palmer, Mass., has filed a petition with the Massachusetts railroad commission for permission to do a trolley express and freight business in and through the town of Palmer. This petition is substantially an appeal from the decision of the selectmen of Palmer that it would be against the wishes of the residents of that town to grant a franchise for this privilege for more than five years.

Richmond Transfer Ordinance Enjoined.—On petition of the Central Trust Company of New York the United States district court at Richmond, Va., has issued a temporary injunction restraining the city authorities and the Virginia Passenger & Power Company from putting into effect the universal transfer ordinance recently passed by the council. All parties are directed to appear on June 29 to show cause why the injunction should not be made permanent. The trust company states that the effect of the proposed increase of transfers would be to greatly decrease the receipts, which are at present insufficient to pay fixed charges.

Construction News

FRANCHISES.

Atlantic City, N. J.—John L. Clawson, receiver of the Atlantic City & Suburban Traction Company of Pleasantville, N. J., has made a proposal to the property owners of Atlantic City that if the city will grant him franchises for electric lines in Pacific and Arctic avenues he will build an electric line to Philadelphia.

Faribault, Minn.—An ordinance has been passed granting to the Minneapolis St. Paul Rochester & Dubuque Traction Company a 25-year franchise for entrance to Faribault. An extension will be built from Faribault to Shieldsville through Roberts, French and Shieldsville lakes.

Flat Rock, Mich.—The town council has granted a franchise to the Toledo Ottawa Beach & Northern Railway Company for the operation of its proposed extension to Detroit through the village of Flat Rock. It is stated that a private right of way will be donated by the village if the northerly route serving Flat Rock is chosen by the company in preference to the other, which would pass some distance south of the village.

Martinez, Cal.—A. W. Maltby and Joseph Napthaly have been granted permission by the board of county supervisors to construct and operate an electric railway through the Alameda and Contra Costa tunnel.

Paducah, Ky.—The Paducah & Cairo Interurban Railway Company has been granted a franchise to build its line in Paducah. The line will extend from Paducah to East Cairo, Ky., where it will connect with ferry boats operating between East Cairo and Cairo, Ill.

Portland, Ore.—The United Railways Company has been granted a franchise for its proposed extension from Portland to Hillsboro by way of Mt. Calvary cemetery. A condition of the franchise prohibits the operation of any cars on the system until the line has been completed to Hillsboro and Mt. Calvary.

Wilmington, Del.—A franchise has been granted to the People's Railway Company for an electric line on Church street from Seventh to Fourth streets, affording connection with the boats of the Wilmington Steamboat Company. (Noted March 21.)

Sacramento, Cal.—W. T. Garrett of San Francisco has applied for a franchise to build an electric railway around Oak Park, six miles long.

RECENT INCORPORATIONS.

Charleston & Casey Traction Company, Charleston, Ill.—Incorporated in Illinois to construct an electric railroad from Charleston, Coles county, to Casey, Clark county, Illinois.

Kokomo Frankfort & Terre Haute Traction Company, Kokomo, Ind.—Incorporated in Indiana to build an electric railway 104 miles long, serving the towns of Kokomo, Frankfort, Crawfordsville, Rockville, Rosedale, Burlington and Terre Haute. It will parallel the Chicago Cincinnati & Louisville from Kokomo to Frankfort and from Frankfort to Terre Haute will parallel the Vandalia. Capital stock, $100,000. Incorporators: W. H. Eikenberry, W. F. Newby, Russiaville; Oliver Gard, James Kent, Frankfort; M. W. Eikenberry, J. C. Dewees, E. B. Swift, R. H. Cross, Kokomo; A. E. Alter, Forest, Ind. (Noted April 11.)

Myersdale Construction & Equipment Company, Pittsburg, Pa.—Incorporated in Pennsylvania to construct, maintain and operate electric railways. Capital stock, $100,000. Incorporators: H. D. Brenn, W. A. Wood, Pittsburg; W. W. Stand, Bellevue, Pa.

Parkersburg Bridge Company.—Incorporated to build a bridge over the Ohio river between Parkersburg, W. Va., and Belpre, O. After the bridge has been completed the company intends to start preliminary work on the construction of a system of interurban railways which will connect Pittsburg, Pa., and Cincinnati, O., the first section being from Pomeroy to Gallipolis, Collville and Columbus by way of Logan and Lancaster, O. Application has been made to the government to build the bridge and work will be started as soon as permission is obtained. Capital stock, $400,000. Incorporators: Jason H. Brooks, Joseph G. Lee, Samuel C. Williams, Charles Newell and James Newell of East Liverpool, O.

Union Traction Company.—Incorporated in West Virginia to build an electric railway from a point on the dividing line between Wetzel and Marshall counties to New Martinsville, Brooklyn, Paden City and Sistersville and from there to St. Mary's in Pleasant county. Capital stock, $150,000, of which $50,000 has been paid in. Incorporators: H. W. McCoy, G. E. Work, S. G. Messer, R. Broadwater, Sistersville; I. D. Morgan, E. L. Robinson, New Martinsville, W. Va.

TRACK AND ROADWAY.

British Columbia Electric Railway, Vancouver, B. C.—This company is receiving bids for the construction of the first section of its proposed Westminster-Chilliwack electric line. This section is 12 miles long and will connect Westminster and Cloverdale. R. H. Sperling, general manager, Vancouver, B. C. (Noted March 14.)

Canadian Valley Railway, Mutual, Okla.—E. O. McCann, secretary of this company, which proposes to build 150 miles of interurban lines connecting Ft. Supply, Woodward, Mutual, Seiling, Canton, Geary, El Reno and Oklahoma City, states that construction work will be started this fall. The road was incorporated in April with a capital stock of $2,000,000. Thomas Martin, president; E. O. McCann, secretary; L. A. Foster, treasurer, Mutual, Okla. (Noted May 16.)

Cherokee Belt & Interurban Railway, Tulsa, Okla.—This company is making preliminary surveys for its proposed line connecting Skiatook, Collinsville, Claremore and Prior Creek, Okla., a distance of 45 miles, and construction work is expected to be started about October 1. The company was recently incorporated with a capital stock of $500,000. Officers: President, E. Batchman, St. Louis; vice-president and general manager, F. E. Montel, Kansas City, Mo.; secretary, J. R. Caudley, Collinsville; treasurer, E. Pease, Collinsville; superintendent, Arthur E. Leap, Collinsville.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—The contract for ballasting and laying track for this company's extension from South Bend to La Porte, Ind., has been let to the St. John Engineering Company of Chicago, Ill. Samuel Riddle, general manager, South Bend.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—The Cleveland Construction Company has just placed a large force of men at work on the 15-mile section of this road between Ashland and Mansfield, O., with the expectation of having it completed in time to care for the Fourth of July traffic. When this section has been completed the company will proceed to build from Mansfield to Mt. Vernon. C. N. Wilcoxon, general manager, Cleveland. (Noted February 22.)

Indianapolis Cloverdale & Terre Haute Traction Company, Indianapolis, Ind.—We are officially advised that E. M. Bowman, president, has secured 30 miles of right of way and the franchises at Mooresville and Cloverdale, Ind., for the proposed line from Indianapolis to Terre Haute, Ind., and that surveys were started on May 25. Harry C. Sandusky, consulting engineer, 413 State Life building, Indianapolis, is chief engineer. (Noted April 25.)

Indianapolis Frankfort Delphi & Chicago Traction Company, Frankfort, Ind.—W. H. Cohee, vice-president and general manager, writes that this company proposes to build an electric railway from Frankfort to Hammond, Ind., 129 miles, via Delphi, Monticello, Monon, Rensselaer and Cedar Lake. Surveys have been completed from Frankfort to Delphi, 27 miles, and contracts for all work and materials for this section are to be let about June 20. The company has water power rights at Pyrmont, Ind., which will develop power for the road from Frankfort to Delphi as well as for commercial purposes, also on the Tippecanoe river at Monticello, which will furnish power for the line to Chicago. Seventy-pound rails will be used and curves and grades are light. Officers: Abe S. Straus, 181 La Salle street, Chicago, president; Bert Wills, Frankfort, secretary, and Charles E. Hyman, Chicago, treasurer; J. R. Brown, Frankfort, chief engineer. (Noted May 9.)

Iowa Railroad, Eldora, Ia.—George Welsby Scott, consulting engineer, Chicago, Ill., has started final surveys for this proposed interurban electric line, which will connect Waterloo, Cedar Falls, Fredsville, Dike, Lincoln, Grundy Center, Eldora, Hubbard, Garden City, Story City, Ames, Boone, Moingona, Perry, Kelley, Huxley, Ankeny and Des Moines, Ia. The overhead trolley system will be used and power for commercial purposes will be furnished to the towns en route. The power plant and repair shops will be located at Eldora. Andrew Stevenson, first vice-president and general manager, 1211 Association building, Chicago, Ill. (Noted April 18.)

Joplin & Pittsburg Railway, Pittsburg, Kan.—The contract for erecting poles and wiring between Joplin, Mo., and Pittsburg, Kan., has been awarded to the Smith, Hurst & Allen Company of Philadelphia. A. L. Register & Co. of Philadelphia have the general contract.

Long Island Railroad, Brooklyn, N. Y.—This company is making preliminary surveys for the proposed electric railway loop to connect Hempstead, Freeport, Uniondale and Roosevelt, about five miles. Two-thirds of the right of way for the line has been offered to the company provided construction is started in the near future. The road will pass north from Freeport east of the New York & Long Island Traction line, will give railroad facilities to Roosevelt and Uniondale, not at present served, and will enable the company to abolish the terminal at Hempstead, permitting through train service from and to New York. It will also afford direct communication with Long Beach. J. H. Savage, chief engineer Long Island Railroad, Jamaica, N. Y.

New York, N. Y.—The New York public service commission of the first district on May 22 awarded contracts for five of the six sections of the Brooklyn Fourth avenue subway as follows: Contract No. 2, extending from Willoughby street to Ashland place, William Bradley—railroad work, $3,436,019; pipe galleries, $58,695; total, $3,494,714. Contract No. 3, extending from Ashland place to Sackett street, William Bradley—railroad work, $3,392,091.50; pipe galleries, $208,135; total, $3,600,226.50. Contract No. 4, extending from Sackett street to Tenth street, E. E. Smith Contracting Company—railroad work, $2,283,553.30; pipe galleries, $206,672; total, $2,490,205.30; Contract No. 5, extending from Tenth street to Twenty-seventh street, The Tide Water Building Company and Thomas B. Bryson—railroad work, $1,945,640.50; pipe galleries, $251,076; total $2,196,716.50. Contract No. 6, extending from Twenty-seventh street to Forty-third street, E. E. Smith Contracting Company—railroad work, $2,808,982.80; pipe galleries, $173,665; total, $2,982,647.80. This amounts to $14,764,510 for the five sections, or $13,866,267 for railroad work and $898,243 for pipe galleries. In every case the contract was awarded to the lowest bidder. Contract was not let for the first section. The awards must be approved by the board of estimate.

Seattle-Tacoma Short Line, Seattle, Wash.—This company has awarded contracts for the construction of its proposed 30-mile line from Seattle to Tacoma to A. D. McInnes of Seattle. The company was incorporated last fall with a capital stock of $6,000,000 to construct a double-track line between the two cities. Merle J. Wightman, American Bank building, Seattle, is general manager. (Noted October 19, 1907.)

Seattle (Wash.) Electric Company.—Construction work has been started on the extension to Alki Point.

Southern Traction Company, Belleville, Ill.—This company, which is building an electric railway from East St. Louis to Belleville, Ill., has filed notice of an increase of capital stock from $2,500 to $1,500,000.

South Morgantown Traction Company, Morgantown, W. Va.—The contract for the construction of the 2-mile extension of this line has been awarded to Frank Alfiery of Morgantown. Estimated cost, $60,000. C. D. Willey, general manager, Morgantown.

POWER HOUSES AND SUBSTATIONS.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—Three substations are now under construction by this company and a portable substation has been completed in readiness for the operation of the extension of this line from Ashland to Mansfield, O., which it is expected will be completed by July 4.

Portland Railway Light & Power Company, Portland, Ore.—Construction will be started at once by this company on a new substation at Northern Hill, near St. Johns. The station will be built so that it can be enlarged at any time and when completed will serve the Swift packing plant. F. G. Sykar, Portland, Ore., general manager light and power.

United Railroads of San Francisco.—Contracts have been let by this company for additional power equipment for installation in its North Beach power house to cost approximately $375,000. The equipment will consist of a Curtis steam turbine direct connected to a 5,000-kilowatt General Electric three-phase 13,200-volt generator, and a new boiler of 3,000 horsepower capacity. A part of the equipment has been received and the remainder is expected in time to have the installation completed inside of two months. (Noted May 23.)

Valley Power Company.—It is stated that this company, recently incorporated in Oregon to build an electric railway from West Woodburn through Monitor to Scott Mills and on to Wilhoit Springs, and the Wenatchee Canal Company, operating in the Wenatchee valley west of Spokane has ordered machinery to equip a 4,000-horsepower plant to be built on the Wenatchee river, four miles above Cashmere, Wash. Power will be generated for the operation of the proposed electric lines and for irrigating purposes. Frank Robertson, Portland, Oregon, is interested. (Noted May 9.)

Personal Mention

Mr. A. R. McLean has been appointed superintendent of the Freeport (Ill.) Railway Light & Power Company. For the past seven years Mr. McLean has been engaged in street railway and interurban secret service work.

Mr. Clarence Coburne, until recently train dispatcher for the Norfolk & Atlantic Terminal Company at Norfolk, Va., has been appointed superintendent of the Berkley division of the Norfolk & Portsmouth Traction Company, effective at once, succeeding Mr. W. E. Davis, resigned.

Mr. Benjamin E. Tilton, whose resignation as engineer of maintenance of way of the Cleveland Electric Railway was announced in the Electric Railway Review of May 16, has been appointed to a similar position with the Rochester Railway Company at Rochester, N. Y., effective at once.

Mr. D. H. Herflicker has been appointed assistant division superintendent for the southern division of the Public Service Railway with headquarters at Camden, N. J. Mr. Herflicker formerly held similar positions with the Scranton Railway, Scranton, Pa., and the electric lines of Wilmington, Del.

Mr. R. B. Stichter, whose election as president of the Southwestern Electrical & Gas Association was noted in the Electric Railway Review of May 16, page 597, is not connected with the Dallas Securities Company, as stated, but is general manager of the J. F. Strickland Company of Dallas, Tex., which manages electric and gas properties in Bonham, Cleburne, Dublin, Hillsboro, Sherman and Waxahachie, Tex.

Mr. John Mellor, for a number of years master mechanic of the Putnam line of the Connecticut Company, has been appointed master mechanic of the Norwich, New London and Putnam lines of the company with headquarters at Willimantic, Conn. Mr. John Humphrey, who has been superintendent of overhead work on the Putnam line, has been appointed line superintendent of the Norwich, New London and Putnam lines, also with headquarters at Willimantic. By this arrangement all the lines in eastern Connecticut, including the line to Willimantic, will be under the supervision of Mr. Mellor and Mr. Humphrey.

Mr. Elmer M. White has been appointed auditor of the Coney Island & Brooklyn Railroad, Brooklyn, N. Y., effective on May 21. The duties of auditor of the company heretofore have been combined with those of the secretary and treasurer, Mr. D. B. Cannon, who will now be enabled to devote his attention to other important work. Mr. White has been engaged in the accounting departments of street railways for over 20 years, his more recent work having been with the Birmingham Railway Light & Power Company, where he was first assistant treasurer and secretary and later treasurer and auditor at Birmingham, Ala. He resigned last November to go to New York, since which time he has been engaged as consulting auditor in making special reports on a number of properties from the physical and operating as well as from the financial standpoint. Mr. White is secretary and treasurer of the American Street and Interurban Railway Accountants' Association, having held this position since January, 1904.

OBITUARY.

I. R. Rosenberger, the first president and one of the organizers of the Easton & Doylestown Street Railway, Easton, Pa., is dead.

William P. Boardman died recently at De Smet, S. D. Mr. Boardman superintended the construction of the old New York & Harlem Railway, one of the first street railways in America, which connected the Bowery, at that time the commercial center of New York, with Harlem, then a small suburban village. During the war he served as an engineer in the army.

America's Coal Lands.

As shown by a new coal area map of the United States geological survey there are about 327,000 square miles of what may be termed the more easily mined coal fields, with an estimated content available for future use of nearly 2,000,000,000,000 tons. With the maintenance of the rate of increase of coal production that has held for the past 50 years, the supply of easily available coal will, according to Director Smith of the geological survey, be exhausted before the middle of the next century. Long before the point of exhaustion is reached, the cost will have become, to most people, prohibitive.

Financial News

Brooklyn Rapid Transit Company.—The New York Stock Exchange has listed $1,375,000 additional first refunding mortgage convertible 4 per cent bonds, making the total listed $33,557,000.

California Gas & Electric Corporation, San Francisco, Cal.—Under the original plan providing for exchange of the general mortgage and collateral trust 5 per cent bonds for unifying and refunding mortgage 5 per cent bonds, the date for deposit was limited to May 1. The time has now been extended to July 1.

Camden & Trenton Railway, Camden, N. J.—The receiver says: "The Camden & Trenton Railway does not receive enough money from the Trenton & New Brunswick Railroad to pay, and the contract should be canceled and a new agreement entered into. The Camden & Trenton road runs through a territory that is very well built up, with a large population at both ends of the line. There is no reason why it should not earn $200,000 within one year after the track is put in good condition, one dangerous bridge removed, a few bad curves eliminated and the power improved. The following year it should earn at least 10 per cent in addition. If this work is done and the expense of operation kept to 65 per cent, there would be left for interest and taxes the second year $77,000."

Chicago Consolidated Traction Company.—Notice has been given to holders of bonds of the Cicero & Proviso Street Railway, the Ogden Street Railway, the Chicago & Jefferson Urban Transit Company and the North Side Electric Street Railway that the Chicago Railways Company is prepared to buy the coupons due on May 1, 1908, on the understanding that the coupons are to be kept alive as the absolute property of the Chicago Railways Company.

International Railway System, Buffalo, N. Y.—Gross earnings for the quarter ended March 31, 1908, were $1,157,628 as compared with $1,173,170 in the corresponding quarter of the previous year. Expenses were $759,486 as compared with $764,830. Net earnings were $398,142 as compared with $408,340. The surplus, after deduction of fixed charges, was $65,730 as compared with $113,825.

Menominee & Marinette Light & Traction Co., Menominee, Mich.—This company will increase its capital stock from $560,000 to $1,000,000 to provide funds for additions.

Metropolitan West Side Elevated Railway, Chicago, Ill.—The Farwell Trust Company and N. W. Halsey & Co. of Chicago have purchased $1,250,000 of the authorized $5,000,000 of extension and terminal first mortgage 4 per cent bonds. The proceeds will be used to provide for equipment notes and loans maturing on June 1.

Northern Texas Traction Company, Fort Worth, Tex.—Lee, Higginson & Co. and Estabrook & Co. of Boston are offering at 97¼ and interest, yielding 7 per cent interest, $500,000 of 3-year 6 per cent notes dated May 1, 1908. A letter from Stone & Webster, general managers, says regarding the property: "The proceeds of the $500,000 notes will pay off all existing floating debt, representing the cost of permanent extensions, additions and improvements, and will leave a substantial cash balance in the treasury. All the authorized mortgage bonds are now outstanding, and no further mortgage can be placed upon the property of the company without equally securing these notes."

Rochester-Corning-Elmira Traction Company.—The New York public service commission, second district, has approved the issue of $3,880,000 stock, making a total of $4,000,000 outstanding, and $4,210,000 of 30-year 5 per cent bonds secured by a mortgage which the commission would limit to $6,000,000, but which the company wished to make $8,000,000. The company has constructed and equipped the proposed double-track electric road from Rochester to Elmira. The commission has stipulated that no bonds shall be sold at less than 85 per cent of par. The bonds may be issued from time to time in instalments of not more than $1,000,000 each and only upon the entry of an order additional to the general order authorizing such issue, upon proof upon the first application that the capital stock has been subscribed by responsible parties and upon each other application showing for what purpose the proceeds of the bonds are to be used in the construction and completion of the work and the disposition made of the proceeds of previous issues of securities.

Seattle (Wash.) Electric Company.—A circular issued by Lee, Higginson & Co. of Boston offers for sale $2,500,000 of consolidated and refunding mortgage sinking fund 5 per cent bonds at 93½ and interest.

Toledo Ann Arbor & Detroit Railroad, Toledo, O.—Judge Lockwood of Monroe, Mich., has ordered the sale of this property under foreclosure to meet claims of contractors and others. The company is at present operated by receivers, Willis Baldwin of Monroe, Mich., and R. H. Burgom of Fremont, O.

Underground Electric Railways, London.—Speyer & Co. of New York have made the following announcement: "Cable advices received from London state that the plan of readjustment of the Underground Electric Railways Company of London has been unanimously carried by the stockholders. It is understood that about 94 per cent of the notes have already been deposited and the success of the plan is assured."

Manufactures and Supplies

ROLLING STOCK.

Aurora Elgin & Chicago Railroad, Chicago, is in the market for 25 sets of double trucks.

Seattle Electric Company, Seattle, Wash., expects to purchase 20 cars in the near future.

Walla Walla Valley Traction Company, Walla Walla, Wash., has ordered two cars from the St. Louis Car Company.

Utica & Mohawk Valley Railway, Utica, N. Y., has ordered four large interurban cars from the Cincinnati Car Company.

Omaha & Council Bluffs Street Railway, Omaha, Neb., has ordered 10 double-truck cars. We understand the order was placed with a St. Louis builder.

Pittsburg Railways Company, Pittsburg, is reported to have ordered about 200 pay-as-you-enter cars for installation on its lines. This item has not been officially verified.

Lake Erie & Youngstown Railway, Youngstown, O., it is stated, is making an investigation of gasoline-electric cars with a view to purchasing rolling stock of this type for equipping its road. J. H. Ruhlman is president, at Youngstown.

Commissioner of Bridges. James W. Stevenson, will sell at auction on June 2 at Brooklyn, N. Y., 92 passenger cars, consisting of 72 coaches equipped with cable grip and vacuum brake and 20 motor cars equipped with four 62½-horsepower motors and vacuum brake.

Portland Railway Light & Power Company, Portland, Ore., as reported in our issue of May 2, has placed an order with the American Car Company for 25 passenger cars of the pay-as-you-enter type. The order was placed on April 21 and will be equipped with two G.E.-58 motors and Brill 27-El trucks. The principal dimensions are as follows:

Wheel base—	Length over all—
20 cars.....4 ft.	20 cars.....45 ft.
5 cars..... ....6 ft	5 cars.....47 ft. 10 in.
Length of body—	Width over all—
20 cars.....28 ft. 8 in.	20 cars..... 8 ft. 3 in.
5 cars.....31 ft. 6 in.	5 cars..... 8 ft. 9 in.
Over vestibule—	Height track to trolley
20 cars.....43 ft. 8 in.	base .....11 ft. 10 in.
5 cars.....46 ft. 6 in.	Body and underframe..Wood

SHOPS AND BUILDINGS.

Third Avenue Railroad, New York City.—Plans have been filed by A. S. Hedman, architect for F. W. Whitridge, receiver, for remodeling the 2-story shops in East Sixty-fifth street.

Oklahoma City El Reno & Shawnee Rapid Transit Railway, Oklahoma City, Okla.—It is reported that this road will build a new car barn and power plants at this point. Charles A. Huber, president, Oklahoma City.

Conestoga Traction Company, Lancaster, Pa.—It is reported that this road has completed plans for the erection of a new car house to be of brick and steel construction and having dimensions of 117 by 400 feet.

Springfield Consolidated Railway, Springfield, Ill.—This company has filed plans with the building commissioner of Springfield for a new depot to be built at that point on Monroe street between Eighth and Ninth streets. The building will cost approximately $5,000 and will have a main waiting room 40 by 60 feet.

Utah Light & Railway, Salt Lake City, Utah.—Erection of the car barns and other necessary buildings, for which plans were approved some time ago, will be commenced at an early date, according to a statement credited to General Manager J. S. Wells. The car barns will be one story in height, 430 by 230 feet with space for 16 tracks accommodating 144 cars. The buildings will be located on the block between Fifth and Sixth South streets and Sixth and Seventh East streets. A 2-story clubhouse, 140 by 160 feet, for the use of the employes, will also be built. The total expenditure at this point is estimated at $600,000.

TRADE NOTES.

Heath & Milligan Manufacturing Company, Chicago, which has been in the hands of a receiver since the latter part of January, has negotiations under way for transferring its stock and other assets to the National Lead Company and other creditors. F. W. Rockwell, general manager of the National Lead Company, it is stated, will become president of the reorganized corporation, which will continue to do business under the present name.

American Railway Appliance Company, Wilmington, Del., has been incorporated in the state of Delaware with a capital of $1,000,000. The incorporators are: F. M. Shive, S. E. Roberson, Harry W. Davis.

Henry Floy, consulting engineer, New York, announces that on the occasion of the tenth anniversary of entering upon his independent business career, he is removing to new offices at 1409 City Investing building, 165 Broadway.

Allis-Chalmers Company, Milwaukee, Wis., has opened an office at 319-320 First National Bank building, Birmingham, Ala., in charge of Seldon Jones as district manager. Inquiries regarding the machinery manufactured by the company will receive prompt attention at that address.

NEW OFFICE BUILDING AND WAREHOUSE OF FAIRBANKS, MORSE & CO.

The general offices and sales departments of Fairbanks, Morse & Co. were moved in April from Franklin and Monroe streets to the corner of Wabash avenue and Eldredge place, Chicago, where the company is now comfortably settled in its new location. The new office building is a 7-story structure, with basement, fronting 165 feet on Eldredge place and 43 feet on Wabash avenue. This is the home office of the company.

The first floor will be used in displaying samples of the miscellaneous lines manufactured and sold, including Fairbanks-Morse gas and gasoline engines, electric dynamos and motors, steam and power pumping machinery, Fairbanks scales, Eclipse windmills, together with their other lines of pumps and general machinery supplies. On the second floor are located the various sales managers and departments which handle the territory of the Chicago house, including the machinery sales department, scale department, and order department. The foreign department, electrical department and billing department are on the third floor. The fourth floor is given up to the administrative officers of the company, with private offices for the president, first vice-president, second vice-president, secretary, treasurer, bookkeeping department, credit department and office of the president of Fairbanks-Morse Manufacturing Company. A general assembly room is also provided for on this floor.

On the fifth floor are located the purchasing department, windmill department and the general supply department. The sixth floor is occupied entirely by the railroad and construction departments. The seventh floor is devoted to the advertising department and is also used for the storage of stationery supplies, catalogues and other printed matter. The fact that this company publishes over a hundred different catalogues and pamphlets descriptive of their various lines, some of these in editions of several hundred thousand copies, makes it necessary to use a great part of the floor space for storing such advertising matter. Power for the elevators, pumping and lighting throughout the building is furnished by two 80-horsepower Fairbanks-Morse vertical multi-cylinder gas engines, each unit direct connected to a 50-kilowatt Fairbanks-Morse direct-current generator. These engines, located in the basement of the building, combine all the good features which are generally recognized as being necessary in the construction of a thoroughly modern gas engine. It is stated by the company that competent engineers who have seen this plant have expressed the opinion that it is the most modern and the smoothest running gas engine installation in Chicago. This will be open to visitors and parties interested in gas power are invited to call and inspect the plant. The engines operate on natural gas. The heating of the building is accomplished by means of two low-pressure Titusville boilers, each 48 inches by 16 feet and provided with the latest design of smoke-consuming devices.

The new warehouse is a 5-story brick structure, 100 by 100 feet, with track facilities on Sangamon street and an alley on the opposite side, with wagon shed. The main entrance is on Nineteenth street. The warehouse capacity has been very much increased, as it is the intention of the company to carry a much larger stock than heretofore, which will enable them to make shipments promptly and otherwise handle their fast growing business to better advantage. The company also reports that its branch houses at Denver, Omaha and San Francisco have recently been moved into the new buildings and that its Los Angeles house will move into a new building within a few months. The steadily increasing business during the past few years has made necessary the extension of its office and warehouse facilities.
